DIAMOND.

DIAMOND, *adamas* of the ancients, *almas* of Persia and *heera* of Hindustan, is the most brilliant of gems; and although known from the remotest times, if we may judge by the casual notice made of it in Scripture, it had in the earlier periods of history obtained little more than a name. Pliny states that it bore a price *above all things in the world*, and was known to very few except princes and crowned heads. His meagre remarks on this gem are even less satisfactory than those upon almost any other; which affords another reason to conclude that the diamond still remained in his time an object of great rarity. The localities quoted by Pliny appear to be quite erroneous; at least subsequent observations give us reason to think so.

Up to the commencement of the eighteenth century diamonds were wholly derived from India, where they were found in detached crystals, accompanied with grains of gold, amongst metallic sand washed down from surrounding mountains. In 1728 a similar territory, loaded with the two most valuable substances in nature, was discovered on the southern continent of the New World. When in pursuit of gold, crystals of diamond were often found; but the labourers being ignorant of their value, laid them aside as curiosities. A miner, who is said to have arrived in Brazil at this time, first directed attention towards them; and, without attempting to appropriate his discovery to his own aggrandizement, he led his comrades to turn their pursuit to the more engaging object. It soon, therefore, attracted the notice of the government, and the district was shortly afterwards taken possession of in name of the sovereign.

Hitherto the supply of diamonds was entirely confined to Hindustan and the island of Borneo; and, as might reasonably be expected, the opening of a new field, the extent of which was as yet wholly unknown, could not fail to affect the market. The discredit which was at first thrown upon the accounts from Brazil, as also on the purity and perfection of the stones, repressed the fears of the Asiatic dealers; and the increased demand after the purchase of the Pitt diamond, a circumstance which no doubt rendered that gem far more *recherché* at the gay and luxurious court of France, all tended to increase the demand, and keep it more upon an equilibrium with the increased supply than could possibly have been anticipated. At a subsequent period, no doubt, the revolution of France interfered with the value of jewels; but the surplus thus produced was soon absorbed by the wealth of Britain, and diamonds of the first water for a long time maintained their ground.

At the present day this perhaps cannot be said to hold good. As a commercial commodity, diamonds must have suffered depression like all others, and may, particularly those beyond the smallest sizes, perhaps be valued at from twenty-five to thirty per cent. under the prices which they bore in the times of Tavernier; although Mawe appears to have been anxious to inculcate a different doctrine. After his examination of the Brazilian district, he says there would be no difficulty in calculating the period requisite to work out the whole of the diamond ground in that country; and as many of the mines of Hindustan are considered as exhausted, the period must come sooner or later when diamonds will be no longer to be had.

In India, Golconda has always been cited as one of its principal repositories, although none was ever found in the immediate vicinity of that fortress, a circumstance traceable perhaps to the geological character of the neighbourhood, which is entirely syenitic. It may have arisen, however, from the fact, that the diamond mines of Raolconda and Ganee Purteeal were situated in the territory of the Kootub Shahee kings of Golconda. When that dynasty was overthrown, and their country occupied by the officers of the Mogul emperors, Golconda ceased to be the capital, and Hyderabad, which is only a few miles distant, became the occasional seat of the new government. The territory in which the mines are situated has since been ceded to the East India Company. It lies near Condapilly, on the northern bank of the Kistna, about fifty miles from the sea, and near the Pass of Bezoara, where the river appears at some period to have forced its way through a chain of hills, and to have emptied an extensive lake which had existed to the westward of them. All attempts to work them have been abandoned, as the produce has ceased to refund the expense of labour. The localities of the diamond in Hindustan are so various that it would be almost endless to enumerate them. Those on the Mahanuddy,

with those on the Kistna and at Mallavilly, north-west of Ellora, may be mentioned as probably the most productive of this gem. The island of Borneo is the only other eastern locality which can boast of its production. The diamond occurs at Pontiana, in that island, directly under the line, and at Benjarmassin, about three degrees south of the equator. Here it is said to be of a quality superior to that of the gems found in the other Indian localities; and to be distinguished in consequence by the name of *Landak*, the place where they are found. Here also the diamond occurs in alluvial soil, accompanied with gold. One diamond of 367 carats was found there upwards of a century ago, and is supposed to be now in the hands of the chief of Pontiana.

From Heyne's account of the working of diamond mines in Hindustan, it seems to afford a very miserable livelihood. He states that the diamond has hitherto been found only in alluvial soil, or in the most recent rocks; and that the stones are not scattered through the whole of these beds, but confined to one rather harder than the rest. The upper stratum, of eighteen inches, consists of sand, gravel, and loam; next there is a deposit of stiff black clay or mud, about four feet thick; and next the diamond bed, which is distinguished by a mixture of large rounded stones. It is from two to two and a half feet thick, closely cemented together with clay. Sometimes this stratum is covered with calcareous tufo. Here shallow pits are excavated, of a few feet in diameter, in such spots as the practice of the workman may induce him to select; he sinks to a depth of a few feet, and searches the bed which he considers most promising for his purposes; and if he meets with little encouragement, he shifts his situation and proceeds elsewhere. Thus a great deal of the country may be turned to waste and neglected, and, when it comes to be again wrought over more carefully, may give rise to the absurd fancy of regeneration.

The miners, M. Voysey (*Asiatic Researches*, vol. xv. p. 120) says, are of opinion all over India, that the chips and small rejected pieces of former searchers actually increase in size, and in process of time become large diamonds; and he finishes his paper by hoping that some future mineralogist would ascertain whether there were any foundation for the vulgar opinion of the continual growth of the diamond; particularly as he hoped at some future period to produce undeniable proof of the re-crystallization of amethyst, zeolite, and felspar, in alluvial soil. This ingenious writer did not live to bring forward his proofs; but had he been doomed to arrive at the age of the patriarchs of old, we are of opinion he would have been puzzled to produce them.

In Brazil, the diamond is more confined to one spot than in India. The district of Minas Geraes comprehends, as far as we yet know, the whole of the diamond grounds hitherto discovered in Brazil. There the workings appear to be carried on more systematically than in India. The operations at the Serra do Frio we have already noticed in the article Brazil (vol. v. p. 293). The Serra do Frio, or Cold Mountain, is a mountainous platform, having an elevation of from sixteen to eighteen hundred mètres. The district over which the diamonds are searched for extends about sixteen leagues from north to south, by about eight from east to west. It is situated twelve leagues north of Tějuco, on the river Tigitouhonha, which falls into the river San Francisco. By the decomposition of the granite and mica-slate, an agglomerate is formed, composed of rounded white quartz pebbles and light-coloured sand, to which the natives give the name of cascalaho; and it is in this substance that the diamonds are found, along with gold, which is sometimes crystallized. It is exactly similar to some of the samples of the diamond deposits of Hindustan sent to the Royal Society of Edinburgh by Mr Swinton, but differs considerably from others, where a conglomerated sandstone of considerable tenacity has in several instances been sent, as the matrix of the diamond.

From anything that has hitherto been ascertained, it does not appear that the diamond has ever yet been seen in a matrix which could be esteemed its original position. Heyne has given two coloured engravings of diamonds in the matrix, but they are in all probability only accidentally agglutinated in ferruginous matter, devoid of the character of rock. The Musnuddy, which joins the Mahanuddy, is mentioned as affording an indication which might lead to a favourable result in such an investigation. At its confluence with the Maund River, near Chunderpoor, and not farther down than Sonpoor, and only on the left bank of the river are diamonds found. Hence the Maund is the point at which the examination should commence; and if the country can be effectually penetrated, it would be well worthy the attention of some enterprising mineralogist.

We have few satisfactory geological accounts of any of the diamond countries; a slight sketch by Voysey, in the article above quoted, is the best that we can refer to. He particularly alludes to a range of hills called the Nalla Malla, or Blue Mountains, near Cummum, on the Gunlacummum river, which are composed of schistose rocks, of all varieties, from clay-slate to pure limestone, accompanied with quartz rock, sandstone, sandstone brescia, flinty slate, hornstone slate, and a tuffaceous limestone, containing imbedded, rounded, and angular masses of all these rocks. These are bounded on all sides by granite, which appears to pass under and form the base. The only rock of this formation on which the diamond is found is the sandstone brescia. "I have as yet," says he, "only visited the rich mines of Banaganpilly (lying in Heyne's map Long. 78. 4., Lat. 15. 4.), where the brescia is found under a compact sandstone rock, differing in no respect from that which is found under other parts of the main range. It is composed of a beautiful mixture of red and yellow jasper, quartz, calcedony, and hornstone, cemented together by a quartz paste. It passes into puddingstone, composed of rounded pebbles of quartz, &c., cemented by an argillo-calcareous earth, of a loose friable nature, in which the diamonds are most frequently found."

Heyne states, that in some of the mines in India the diamonds are found entirely broken or crushed, and only of value for pounding; but at the same time thinks it must be owing to carelessness. He mentions also that the diamonds of Cuddapah are carried to Madras to be used for the same purpose, and the price he quotes for a carat of stones fit for brilliants is only seven rupees.

In 1829, a number of small diamonds were discovered in the gold sands of the Ural Mountains, in a deposit very similar to that in Brazil, in a quartzose mica-slate, to which some have given the name of *Itacalumite;* and more lately a few have, it is said, been found in the gold washings of Georgia and N. Carolina, as well as in the Sierra Madre, S.W. of the city of Mexico.

The diamond, in its primitive form, is that of the equilateral octahedron. It passes into the dodecahedron and the cube, presenting modifications in each. The colourless diamond of the first water is the most valuable; but very fine diamonds sometimes present a deep red tinge, also yellow, orange, green, blue, and black. Those which have a slight tint of yellow are often remarkably brilliant, and are said to be of a superior hardness.

The value of diamonds is always calculated by the carat, which consists of four grains; but it must be remembered, that the diamond grain differs from the Troy grain, as it takes five of the former to weigh four of the latter, or more exactly one carat $=$ 3·174 gr. Troy.

In valuing diamonds, either rough or cut, the practice is to take the weight in carats, to square that weight, and then to multiply the product by such a rate of price as may cor-

respond to the state and quality of the stone; thus, if a natural crystal of diamond be clear, without flaws, and of a favourable shape, the price by which the square of its weight should be multiplied is L.2; so that if the stone weigh one carat, its value will be L.2, if two carats, $2 \times 2 = 4$, and $4 \times 2 = 8$, or a stone of two carats is worth L.8. A stone of ten carats, in the same way, will give $10 \times 10 = 100$, and $100 \times 2 =$ L.200, the value of a perfect rough diamond of this weight.

If the diamond has been worked into a brilliant of just proportions, the same rule is observed of squaring the weight in carats; but a much higher price is used as the multiplier of the product, as L.8 is considered to be the proper multiplier when the stone is perfect in water and shape. Thus a diamond of $5\frac{1}{2}$ carats gives $30\frac{1}{4}$ as its square, and this multiplied by 8 makes L.242 as its price. If the stone has been worked into the form which is termed a rose, L.6 is used as the multiplier; and if it be of the form termed table-cut, it is still lower.

Considerable modifications, however, must be made in these multipliers, according to the quality of the diamonds and the state of the market. If a brilliant be what is termed "off colour," that is, not absolutely colourless, or if it be in any other way imperfect in shape or purity, a corresponding diminution must be made in the multiplier. Thus a brilliant with a yellow or milky hue, or with a small speck or flaw, may not be multiplied by more than L.4, L.5, or L.6, according to the nature or extent of the imperfection. The state of the demand in the market must likewise have great influence. At present the demand for good brilliants of one carat and under is greater in proportion to the supply than for heavier stones, and such stones will therefore sometimes cost L.10 the carat; whilst there being fewer purchasers for the larger sizes, they may often be had in commerce at a lower rate than has been mentioned above.

The finest known diamonds are the following:—

That of the crown of France (Pitt diamond), weighing $136\frac{3}{4}$ carats, the value of which, taken according to the above rule, would be L.141,058. The dimensions of this fine stone are stated to be,

Length	1·2437 inches.
Breadth	1·177
Depth	·859

Weight in Troy grains, 434.

That of the Grand Duke of Tuscany (now Austrian) weighing $139\frac{1}{2}$ carats, valued as above at L.153,682.

That of the Emperor of Russia, weighing 195 carats. This diamond is rose cut.

The Koh-i-noor, weighing 186 carats, also rose cut.

That of the King of Portugal, weighing 1680 carats, being rough, not less than L.5,644,800.

It is consequently quite evident that this rule can obtain only among diamonds of moderate size; and, if it should establish something by which a price may be named, all else must be left to subsequent arrangement.

Of the remarkable diamonds we have enumerated, the first is that known by the name of the Regent or Pitt diamond. It was found at Pasteal, in the Golconda district. It was imported into this country by Mr Pitt, governor of Madras, who purchased it from a native for 48,000 pagodas, about L.20,400 at the exchange of the day; and after being offered to different crowned heads in Europe, was purchased by the regent of France in 1717 as a jewel for the crown. It was placed by Napoleon in the hilt of the sword of state, and, according to Brard, the price paid for it was 2,250,000 francs; Jeffreys calls it L.125,000, and other authors say L.130,000. Any of these, however, although by much the largest price ever paid for any jewel, is not equal to the rule of value. This is esteemed the finest and most perfect diamond known.

The second was purchased for a bit of rock-crystal, on a stall in the market-place of Florence, at the cost of a few pence: it is of a beautiful lemon-yellow colour, and is now in possession of the house of Austria. The diamond mentioned as the property of the Emperor of Russia ornaments the top of his sceptre. It is of the size of a pigeon's egg, and is said to have been the eye of an Indian idol pillaged by a deserter from the French service, who had the address to get himself installed as a priest in the service of the Malabar deity at Seringham, as narrated by Dutens. The Empress Catherine purchased it for L.90,000, together with an annuity of L.4000, and a title of Russian nobility.

The Koh-i-noor is described by Tavernier as an irregularly-shaped diamond, but cut and polished. It was found in the district of Golconda previous to the Christian era, and is said to have weighed 900 carats before cutting; but this appears a most enormous sacrifice. Of the Brazilian diamond some suspicions have been entertained. It has been insinuated that it is only a mass of very fine colourless topaz, and it is not likely that the king of Portugal will run the hazard of ascertaining the fact.

The supply of diamonds from Brazil, according to Baron d'Eschwege, during the eighty-four years from 1730 to 1814, was at the rate of 36,000 carats per annum: but the return from the registers of the administration of the diamond mines from 1800 to 1806 was only 19,000 carats. It is also added, that the revenue derived by government during the first period was only eighteen or nineteen francs the carat, whilst from forty to fifty were obtained during the last; a certain indication of a diminished supply. A singular circumstance is noticed with respect to the uniformity of the diamond ground of Do Frio. The same cubic mass of cascalho will yield, on washing, pretty nearly the same number of carats, in large or small diamonds, so that the superintendent can calculate on the probable produce of the washing.

Large stones do not abound in Brazil, but there are some of considerable dimensions. Mawe mentions one of 120 carats from the little rivulet D'Albaite; but they do not often exceed from eighteen to twenty.

The prices of diamonds quoted by Heyne, who visited with a scrutinizing eye the principal mines of Hindustan, differ from those laid down by the rule of Tavernier and Jeffreys. Without attempting to reconcile them, we shall quote the value which the Hindus put upon what they consider as the best, and denominate the Brahma diamond: it is sold by the manjalin, which is equal to two carats, and each carat at the price of ten pagodas.

One manjalin	10 Madras pagodas.
Two	24
Three	40
Four	80
Five	100
Six	150
Seven	250
Eight	400

He adds that these are the prices of stones free from speck, flaw, or crack. Cut stones are valued in a different way.

The most remarkable circumstance in the history of the diamond is to be found in the nature of its composition. This proud, this imperial ornament, which has ever occupied the summit of the diadem, this most brilliant of gems, and hardest of all known bodies, is, after all, but a morsel of charcoal, which has been made to yield to the rays of the sun, and dissolve into a noxious vapour. As early as 1607, Boetius de Boodt threw out the hint that diamond was inflammable. In 1673 Boyle discovered that when it was exposed to a great heat it was dissipated in acrid vapour. In 1694, the experiments of Boyle were confirmed by those of Cosmo III., Grand Duke of Tuscany, with his celebrated burning glass. About the same time, but whether before or not is uncertain, Sir Isaac Newton was led, from the great

refractive power of the diamond, to pronounce it "an unctuous substance coagulated." Lavoisier proved it to be composed of carbon, by throwing the sun's rays concentrated by a powerful lens upon a diamond inclosed in a vessel with oxygen gas; when the diamond and the oxygen disappeared, and carbonic acid was generated. Sir George Mackenzie repeated the experiments of Boyle in 1800; and, finally, when Sir Humphry Davy visited Florence in 1814, the experiment of the grand duke was performed again with the same lens; and mineralogists no longer hesitated to place the gem amongst inflammable bodies.

According to Ellicot, the specific gravity of Brazil diamonds is 3·513, and of India diamonds 3·519. The former is the mean of four, the latter of ten experiments.

Diamond cutting was little understood till 1476, when an artist of the name of Berghem, residing at Bruges, introduced the practice of using diamond powder for forming and polishing the facets. Holland, in consequence, long maintained a monopoly of this trade; and to this day the smaller diamonds are almost entirely manufactured for the European market at Amsterdam. The Pitt diamond was, however, cut and polished in London, as most of the larger sized stones continue to be. It is a very laborious and tedious operation. The grinding into the required form is entirely done by the hand. Two stones are cemented to the ends of tool handles, and rubbed with a powerful pressure against each other, a leaden model being first taken of the rough stone intended to be cut. The faces are thus determined. The two stones are then rubbed together over a little metal box having a double bottom, the upper one being loose and perforated with small holes, through which the diamond dust passes, and is carefully preserved. The desired form being thus obtained, the dust, mixed up with vegetable oil, is afterwards used in polishing the faces of the diamond on a common lapidary's wheel, and the brilliancy of the gem brought out. The period of constant work required to reduce a stone of between twenty-four and thirty carats to a regular form will extend to at least seven or eight months' constant work. The Pitt diamond was said to occupy two years. From the outline in Plate I., there was a great deal of extraneous matter to reduce, and that space of time may very likely have been required. When the mass to be removed is of such a size as to render it of importance to keep it entire, the piece is cut off by means of a steel wire, extended on a bow of cane or whalebone, anointed with diamond powder. This process is very commonly adopted in India. The diamond is sometimes also split by means of a chisel under a sharp stroke of a hammer; but this means requires great firmness of mind and dexterity of hand, for a valuable stone is sometimes destroyed by an unlucky blow.

The forms into which the diamond is cut are the brilliant, the rose, and the table. The first is composed of a principal face, which is called the table, surrounded by a fringe composed of a number of facets, which is all that is visible above the bezil when set. The proportion for the depth should be half the breadth of the stone, terminated with a small face, parallel to the table, and connected with the surface by elongated facets. As the octahedron is the most common natural form of the stone, and the brilliant cut is by far the most advantageous in point of effect, and as this is also generally the most economical form that can be adopted, it is preferred. The others are suggested by the shape of the mass.

The rose is entirely covered with facets on the surface, and is flat below. The table form is adopted in consequence of the shape of the mass, whether crystal or fragment, and produces the least effect. It is principally used in India, where the native jewellers cleave stones into plates, having often a large surface with little proportioned weight or brilliancy, except at the edges, which are ornamented by being cut into facets. The great diamond called the Koh-i-noor is rose cut. This celebrated gem was found, according to Hindu legend, in Southern India, in one of the mines of Golconda, situate near the left bank of the river Krishna. It resembles in shape the half of an egg, and is acknowledged to be of the first water. Its weight is 186 carats; a gravity in reference to which, under the ordinary mode of computation, a pecuniary value may be assigned to it of L.276,768. The fortunes of this magnificent jewel have been for the most part decided by the leading political events which have swayed the destinies of the country of its origin; its possessors having been almost without exception either the rulers or the conquerors of India. At the commencement of the Christian era, it appears to have been the property of the powerful rajah of Oojein, from whom it descended to his successors, the rajahs of Central India. Upon the subversion of the principality of Malwa by the Mohammedans in the early part of the fourteenth century, it became the prize of Ala-ud-din, the Patan sultan of Delhi. Baber, the founder of the Mogul dynasty, obtained the gem with his empire in 1526; and from him it was transmitted through a line of illustrious princes to Mohammed Shah, the great grandson of Aurungzebe. This prince in 1739 surrendered it to Nadir Shah, the Persian invader of India. According to popular tradition, Mohammed wore the diamond in his turban at his interview with Nadir, who, espying the jewel, proposed an exchange of turbans as a token of mutual regard and confidence. Nadir bestowed upon his prize the name of the Koh-i-noor or Mountain of Light. Upon the assassination of this monarch the gem fell into the hands of Ahmed Shah, the founder of the Abdali dynasty of Caubul. From this prince it descended to his successor Shah Shuja, who being expelled from his throne became, in 1813, the nominal guest, but substantially the prisoner of Runjeet Singh, the lion of the Punjaub. Runjeet resolved to set a price upon the liberty of his captive, and demanded from him the Koh-i-noor. After a considerable interval, during which remonstrance and artifice were fruitlessly employed, the Shah yielded a reluctant consent, and a day was fixed for its delivery to a new master. Accordingly on the 1st June Runjeet waited on the Shah with a few attendants, to receive the jewel. He was met by the exiled prince with much dignity, and both being seated, a pause and solemn silence ensued. which continued for nearly an hour. Runjeet then getting impatient, whispered to one of his attendants to remind the Shah of the object of the interview. No answer was returned, but the Shah made a signal to an eunuch who retired and brought in a small packet which he set down on the carpet at equal distance between the chiefs. Runjeet desired an attendant to open the packet, when the diamond was exhibited, and the ruler of the Punjaub retired with his prize. Runjeet was highly elated by the acquisition, and wore it as an armlet at public festivals. After his death it was preserved for a time to his successors, and was occasionally worn by Khurruk Singh and Sheer Singh; but in 1849, upon the abdication of Dhulep Singh, the Maharajah of the Punjaub, and the annexation of his dominions to the British empire, it was stipulated that the Koh-i-noor should be surrendered to the Queen of England. It was accordingly brought to this country by Lieutenant-Colonel Mackeson and Captain Ramsay, who deposited their charge in the hands of the chairman and deputy-chairman of the East India Company, by whom, in company with the president of the India board, the Koh-i-noor was presented to her Majesty on the 3d July 1850. Thus the unrivalled gem for which kings and emperors have contended, finds its resting-place with the sovereign of the most widely extended empire that ever existed—an empire stretching over countries in the east which the previous possessors of the Koh-i-noor never subdued, while in the west it embraces dominions to which, even in imagination, their views never extended.

The Koh-i-noor formed part of the treasures displayed at the Great Exhibition in London in 1851, since which time it has been recut with increased effect.

Much of the value of diamonds depends on the cutting of the stone. A late celebrated philosopher, who required a piece of diamond for philosophical purposes, found a large mass in the hands of a jeweller. It was of an awkward form, and presented a flaw which very greatly deteriorated its value, as, in consequence of the refraction and reflection which took place within the mass, the flaw seemed to occupy nearly the whole of the interior. The gentleman, however, was not afraid. He paid a large sum for the stone, directed the workman in cutting it, amputated the piece he wanted, separating the flaw, and sold the remainder back to the jeweller, after it had been properly cut and polished, for double the price he paid for it.

Hopes at one time were excited that a new diamond district had been discovered in Siberia by Baron Von Humboldt. He thought he had met with appearances in a territory belonging to Count Demidoff, analogous to that of Minas Geraes, and recommended a search for the gem. This has more lately been successful; and about fifty small diamonds have been obtained from the Ural district.

Explanation of the Plate, No. CCIII.—The three figures at the top, Nos. 1, 2, 3, are representations of the Regent or Pitt diamond, the Koh-i-noor, and the Grand Duke, of the full size and form. No. 4 presents the brilliant cut, looked at perpendicularly. No. 5, the same sidewise. Nos. 6 and 7 also represent the brilliant before it undergoes the process of re-cutting. Nos. 8 and 9 are the vertical and lateral appearances of the rose-cut diamond; and Nos. 10 and 11, that of the table-cut. The scale No. 12 exhibits the sizes of the set diamond within the bezil, together with the depth of the stone, and the number of carats a diamond of that size is likely to weigh. This estimate can only be an approximation to the exact weight; but the weight of a set stone may thus be very nearly ascertained. No. 13 is the figure of the octahedral diamond seen perpendicularly, with the table traced where the stone should be cut; and No. 14 is the same crystal, seen laterally, with the table and the opposite face also traced. By these figures it will be seen how much more advantageous it is to adopt the brilliant form than any other.

Diamonds have been imitated with great success by the French artists. To this composition, to which they give the name of *strass*, they not only communicate the adamantine lustre of the zircon, but succeed in giving it such a similitude to the real stone in all respects, hardness excepted, that it is nearly impossible for unpractised eyes to detect the difference. Recently quartz has been used with great effect to form the faces of factitious stones.

Diamond, *used by Glaziers*, an instrument of steel or iron, into the point of which a diamond is introduced and fixed by solder. The diamond must be so adjusted, that by applying the instrument in a particular position the angle of the crystal will come in contact with the glass. See Glass.

Diamond, in *Heraldry*, a term used for expressing the black colour in the achievements of peerage.

Guillim does not approve of blazoning the coats of peers by precious stones instead of metals and colours; but the English practice allows it. Morgan says the diamond is an emblem of fortitude.

Diamond *Harbour*, a port so called, situate on the Hooghly river, about 30 miles below Calcutta. Previous to the relinquishment of commerce by the East India Company, this was the spot where many of their ships unloaded and took in great part of their homeward bound cargoes. There are mooring chains for the accommodation of shipping and storehouses on shore; and in the adjacent villages, consisting of a few thatched houses with some petty shops, provisions may be purchased. But the place is very unhealthy, especially during the periodical rains in July, August, and September, owing to the exhalations from the swamps, and the heavy dews. A good road has been constructed between the harbour and the metropolis; and communication is also maintained between the two places by means of an electric telegraph. Lat. 22. 12.; Long. 88. 10.

Diamond *Island* is situated on the east side of the Bay of Bengal, 12 miles S. of Cape Negrais. It is about a mile and a half long, by one broad; low, covered with wood, and surrounded by shoals, which render it dangerous for boats to land. It has fresh water, and abounds with turtle. It belongs to the British, but is uninhabited. E. Long. 94. 19.; N. Lat. 15. 51.

DIAMPER, a town of Hindustan, province of Cochin, said to be inhabited chiefly by Christians. Here in 1599 a synod was held by the Portuguese archbishop and others, in the hopes of converting the Nestorians to the faith of the Roman Catholic Church, but without effect. N. Lat. 10. 2.; E. Long. 76. 29.

DIANA, in the mythology of Rome, a Latin deity, whose history and office bore so many points of resemblance to those of the Grecian Artemis, that she was latterly identified with that divinity. The worship of Diana, who seems to have been at first rather a local Latin goddess than one of the recognised deities of Rome, is first mentioned as celebrated by the lower classes of citizens in the reign of Servius Tullius. She was at that time regarded as the tutelary goddess of the slaves and plebeians; and her rites were yearly celebrated by these classes of the people on the anniversary of the day on which her temple was consecrated on the Aventine Hill. The name and attributes of Diana were derived from the Sabines, and became known to the Romans when that people was incorporated with the original plebeians of the Roman state. From them the worship of the goddess became gradually diffused among the knights and patricians; and as soon as it was known that a divinity in all respects corresponding to Diana had a high place in the Greek mythology, she was ranked by the Romans among the *dii majorum gentium*, and worshipped with the greatest honours.

As soon as the identity of Artemis and Diana was established, the Grecian myths regarding the birth, history, and functions of the goddess were universally adopted. According to these, Diana was the daughter of Jupiter and Latona, and the twin-sister of Apollo. She was born along with her brother on Mount Cynthus, in the isle of Delos, which up till this time had been a floating island, but was permanently fixed by Neptune in its present place in order that Latona might there find refuge from the persecutions of Juno, and give birth to her children in peace. By the Greeks and Romans Diana was worshipped under a variety of aspects. She was both a destroying and a preserving goddess. In the former capacity she was represented as a full-grown virgin, bearing, like Apollo, a bow and a quiver full of arrows with which she darted death and pestilence among those who offended her; as a preserving deity she watched over the sick, and assisted the unfortunate. Young girls and child-bearing women were believed to be under her especial protection. From this circumstance she was called by the Greeks *Ilithyia*, and by the Latins *Genitalis;* and as she herself was proof against the allurements of love, the priests and priestesses consecrated to her service were compelled to live in the strictest chastity. As Apollo was the god of the sun, Diana was in like manner believed to be the goddess of the moon, from which circumstance she was called by the Greeks *Selene*, and by the Romans *Lucina*. The last and most splendid of all the ceremonies in honour of Diana was the national festival instituted at Rome by Augustus, in compliance with the orders of the Sibylline books, in honour of which Horace composed his famous *Carmen Sæculare*. In this hymn Apollo and Diana are invoked together as the presiding deities of Rome; and the

various offices and functions of both deities, as understood at that time, are minutely described.

In her character as a huntress, Diana is most generally represented in Greek works of art as a tall and handsome virgin, with long hair floating down her neck—drawing an arrow from her quiver with her right hand, and with her left restraining a stag which is endeavouring to escape. As the goddess of the moon she is represented with a long robe reaching to her feet, while her forehead is adorned with the crescent of the moon.

Besides the general homage paid at Greece and Rome to Diana, as one of the dii consentes, there were certain places in which she was worshipped with peculiar rites, and vested with special functions. Of these the most important was Ephesus, where the temple of the goddess was so splendid as to be reckoned one of the wonders of the world. The Ephesian Diana differed considerably from the Greek in the nature of her office. She seems to have typified the reproductive and all-nourishing powers of nature. Hence her image was the figure of a female with many breasts; and the officiating ministers of her temple were eunuchs. Her head was adorned with a mural crown, and the lower part of the figure was covered with hieroglyphic symbols. The worship of Diana is said to have been instituted at Ephesus by the Amazons. Next in importance to the Ephesian was the Taurian Diana. The worship of this goddess was believed to have been at one time accompanied with bloody rites, such as sacrifices of human victims, &c. Her statue was brought from Tauris by Orestes, who on his way back to Sparta landed at Brauron in Attica, from which circumstance the goddess was called *Braurontia.* The image was thence removed to Sparta, where it was placed in an upright position in a temple specially consecrated for its reception; and the deity whom it symbolized was known as Artemis Orthia. It was before this statue that the ceremony of the public scourging of the Spartan youth was observed. (See DIAMASTIGOSIS.) Besides the Ephesian and the Taurian Diana there only remains to be mentioned the Arcadian, who was in an especial manner the patron of hunting and other sylvan sports. She is usually described as frequenting the glades of Taygetus, Mænalus, and the other wild mountains of Arcadia that abounded in game. Twenty nymphs accompanied her in the chase, and with sixty more she celebrated her nightly dances under the bright light of the moon. Her bow and arrows were the workmanship of Vulcan, and her hounds were the gift of Pan. Four stags with golden antlers drew her car. The name of Diana is associated with some of the most beautiful of the ancient myths. See ARTEMIS, ACTÆON, ENDYMION, NIOBE, ORION, &c.

DIANÆ ARBOR, or ARBOR LUNÆ, a name given by the old chemists to the beautiful arborescent form of silver, produced by dissolving it in nitric acid, and precipitating it by another metal.

DIANDRIA, in *Botany*, the second class in the Linnæan system, and comprehending, as its name imports, all genera with flowers possessing but two stamens.

DIANO, a town of Naples, province of Principato Citeriore, situated in a fertile valley at the foot of Mount Motulo, 46 miles S.E. of Salerno. Pop. 4500.

DIAPASON, in *Music*, a name given by the Greeks to the interval of the octave, and so called because the octave embraces all the sounds of the perfect system. It means also the compass of any voice or instrument. Makers of musical instruments have also a rule or scale called *diapason*, by which they regulate the size and the different parts of the instrument to be made. *Diapason* means also a particular stop in the organ.

DIAPENTE, the ancient Greek name for the musical interval of a fifth.

DIAPER, a kind of cloth on which are formed various figures, and which is chiefly used for table-linen.

DIAPHANOUS (διαφαίνω, *I shew through*) an appellation given to all transparent bodies, or such as transmit the rays of light; as glass, &c.

DIAPHONICS (δια and φωνή, the *voice*), the doctrine of refracted sounds.

DIAPHORESIS (διαφόρησις), in *Rhetoric*, is used to express hesitation or uncertainty in the speaker.

DIAPHORETICS (διαφορέω, *I carry through*), such medicines as promote perspiration.

DIAPHRAGM (*Diaphragma*), in *Anatomy*, the midriff, called by anatomists *septum transversum.* It is a strong muscular substance, separating the breast or thorax from the abdomen or lower venter, and serving as a partition between the abdominal and the thoracic viscera. (See ANATOMY, vol. iii., p. 39.) Plato, as Galen informs us, first called it *diaphragm*, from the verb διαφράττειν, *I separate.* Till his time it had been called φρένες, from a notion that an inflammation of this part produced frenzy, which is not more warranted by experience than another tradition, that a transverse section of the diaphragm with a sword causes the patient to die laughing. The term is used analogously to denote something that divides or separates; as, for instance, the plate which divides the cavity of certain shells into two parts, and so forth.

DIARBEKIR, a city of Asiatic Turkey, and capital of the pashalic of Diarbekir, situated on a mass of basaltic rock, which rises in an eminence on the western bank of the Tigris. N. Lat. 37. 55., E. Long. 39. 52. It is about three miles in circumference, of a nearly circular form, and is encompassed by a lofty thick wall of black stone. This wall, which is supposed to be a work of the Romans, is fortified by numerous round and square towers at irregular intervals. The whole is now in a ruinous condition. The town is also environed by a ditch, and has four gates leading to Mardin, to Asia Minor or Rumelia, to the mountains of Armenia and Kurdistan, and to the river. The citadel, standing about midway between the two last-mentioned gates, is thus in the north-east angle of the town, and commands both the valley of the Tigris below, and the town. It is surrounded by a wall, and is divided into many courts. It contains also the palace of the pasha, which is a commodious rather than a splendid building. In one of the stables are the remains of an old Christian building. The citadel is now almost completely in ruins. There is a fine view of the town from this height. The houses are built of black basalt in the lower stories, and of dark-coloured brick in the upper ones. This, with a succession of flat terraces, gives a sameness and gloominess of aspect to the town, which, however, is somewhat relieved by the view of the mosques, towers, and little garden-plots in different parts. Of the mosques seen from the citadel, there are fifteen with minarets, nine having circular shafts and galleries in the Mohammedan style, and the remaining six with square towers, after the manner of Christian churches. There are five other mosques with domes or cupolas only, and several smaller ones, making altogether twenty-five Mohammedan places of worship. Among the minarets of the mosques, some were observed by Mr Buckingham to be highly sculptured; and in several of the square towers were intermixed layers of red burnt brick, mixed with masonry of stone, after the manner of the Roman towers in the walls of Antioch. Amidst the ruins of the castle some fine arches of highly burnt bricks were also observed, which, from their form, as well as material, looked more like Roman than Saracenic work. The bazaars and baths contain brickwork of a similar kind, which Mr Buckingham thinks is decidedly Mohammedan. Broken columns of black marble are seen scattered in different quarters of the town; and among these are several Ionic capitals of Greek origin. Of the Christian churches, the Armenians have two, one of them large and richly decorated, and the other smaller, but more tastefully

adorned. The Catholics have one church, with a convent attached to it; the Syrians and the Greeks have also each a place of worship; and the Jews have a small synagogue for their service. There are upwards of twenty baths in the town, and about fifteen khans or caravanserais. The Khan Hassan Pasha is particularly fine; and in its lower court the corn-market is usually held.

Diarbekir was one of the most flourishing and wealthy cities of Asia, and formerly contained about 40,000 families. It had very extensive manufactures, and an active trade with Baghdad in Indian, and with Aleppo in European produce. The plain was cultivated in every part, and covered with villages; and within three miles of the gates were several villages, each containing from 400 to 500 houses. The number of houses or families in the city are now only about 8000 (of which 1500 are Armenian, 85 Catholic, 70 Greek, 50 Jewish, and 6300 Turkish). The trade with Baghdad is annihilated, and that with Aleppo is reduced to insignificance. There are but few merchants, and those not wealthy; the people have few means of occupation; and not a village remains in the plain. The climate, though excessively hot in summer, cannot be said to be unhealthy; and in winter the temperature is delightful. The situation of Diarbekir admirably adapts it for a great commercial city, and nothing appears necessary to revive its ancient importance but a removal of the causes which have occasioned its decline, namely insecurity to trade from the attacks of the Kurds. The Tigris is not used as a channel of transport so high up as Diarbekir; but rafts of timber are sometimes floated down from the mountains above the town.

From the circumstance of the walls and buildings of this city being constructed almost wholly of black stone, it is called by the Turks Kara Amid, or the Black Amid. Its ancient name was Amida; the name of Diarbekir is used chiefly by the Arabs, as the name of Amid is still used by the Turks in all their public writings. Amida was successively taken, retaken, and destroyed, in the ancient wars between the Persians and Romans. It was pillaged by Tamerlane in the year 1393; and was successively taken and retaken by the Persian kings, until it was conquered by Selim, the first sultan of the Osmanli Turks, in the year 1515. In 1605 it again fell under the power of Persia; but it was afterwards retaken by the Turks, under whose dominion it has since continued.

DIARTHROSIS, in *Anatomy*, a kind of articulation or juncture of the bones which affords room for a manifest motion. The word comes from διa, and ἄρθρον, *a joint*. It is opposed to *synarthrosis*, in which the articulation admits of no sensible motion.

DIARY (Lat. *diarium*, from *dies* a *day*), a journal or register of daily occurrences or observations.

DIASCHISMA, in *Music*, an interval equal to the half of a minor semitone, according to Boëthius.

DIASIA, in *Antiquity*, a great festival celebrated at Athens, immediately beyond the walls, in honour of Zeus (Jupiter). It took place towards the end of the month Anthesterion (February), and was accompanied by a great fair. All persons brought offerings, which consisted either of victims or of incense, according to the means of each individual.

DIASTASE. See Brewing, vol. v. p. 320; and Chemistry.

DIASTEMA, the name given by the Greeks to a simple musical interval, as distinguished from a compound one.

DIASTOLE, the dilatation of the heart, auricles, and arteries: opposed to *systole*, or contraction. See Anatomy.

Diastole, in *Grammar*, the extension of a syllable; or a figure by which a syllable naturally short is made long.

DIASTYLE. See Glossary to Architecture.

DIASYRMUS, in *Rhetoric*, a kind of hyperbole, being exaggeration of something that is low and ridiculous.

DIATESSARON, the Greek name for the musical interval of a fourth.

DIATHERMOUS, a term applied to such substances as suffer radiant heat to pass through them; such as transparent pieces of rock-salt, &c.

DIATHESIS, in *Medicine*, any particular state of constitution which predisposes to disease. Hence the terms inflammatory, putrid, gouty, diathesis, &c.

DIATONIC, in *Music*. See Music.

DIAZ, Bartolomeo, a Portuguese navigator, placed in 1486 at the head of a small squadron fitted out by John II., to make discoveries on the east coast of Africa. He sailed round the south point of that continent, to which he gave the name of *Cabo Tormentoso*, but was compelled to return on account of a mutiny on board his ships. The king altered the name of the cape to its present appellation, viz., the Cape of Good Hope. In 1500 Diaz sailed with Cabral to the West Indies.

DIBBLE, a pointed instrument used to make holes for planting young trees, slips, and seeds.

DIBDIN, Charles, a well-known writer of songs and musical composer, was born at Southampton in 1745, and was the youngest of a family of eighteen. His parents designing him for the church, he was sent to Winchester; but his love of music early diverted his thoughts from the clerical profession. After receiving some instruction from Kent, the organist of Winchester Cathedral, he went to London. His first dramatic pieces appeared on the stage of the Covent Garden Theatre, and in 1778 he became musical manager in that establishment. At this period his success on the stage was far from being commensurate with his ability as a composer. A series of mono-dramatic entertainments which he gave at his *Sans Souci*, brought his songs, music, and recitations more prominently into notice, and permanently established his fame as a lyric poet. On retiring from public life in 1805, he was rewarded by government with a pension of L.200 a-year, of which he was only for a time deprived under the administration of Lord Grenville. Dibdin died of paralysis in 1814. Besides his *Musical Tour*, his *Professional Life*, a *History of the Stage*, and several smaller works, he wrote upwards of 1400 songs and about 30 dramatical pieces.

Dibdin, *Thomas Frognall*, D.D., nephew of the preceding, a celebrated philologer and antiquarian, was born at Calcutta in 1775. He received his education at St John's College, Oxford, and afterwards entered on the study of law under Basil Montague. Abandoning the legal for the clerical profession, he took orders in 1804; and while holding various lectureships in the metropolis, he devoted himself with great ardour to literary pursuits. In 1824 he was appointed to the rectory of St Mary's, Bryanstone Square, an appointment which he held till his death in 1847. Dibdin's works are exceedingly voluminous. The most important are the *Bibliomania*, the *Biographical Decameron*, the *Biographical Antiquarian and Picturesque Tour*, *Reminiscences of a Literary Life*, and *Bibliotheca Spenseriana*.

DICASTES, in *Antiquity*, a judge, or rather a juror, at Athens.

DICE (plural of *die*), cubical pieces of bone or ivory, marked with dots on each of their faces, from one to six. They are used in various games of chance, by being thrown from a box.

DICÆARCHUS, a celebrated Peripatetic philosopher, historian, and geographer, was a native of Messana in Sicily. He was the contemporary of Theophrastus and Aristotle, and flourished towards the close of the fourth century B. C. The exact dates of his birth and death are unknown: the time of the latter event is approximately fixed by good authorities as the year 285 B. C. Nothing is known with certainty concerning the life of Dicæarchus except that he was a disciple of Aristotle, and a friend of Theophrastus, to

whom he dedicated the majority of his works. Of his writings, which comprised treatises on a great variety of subjects, none have descended to our day. Nothing but their titles and a few fragments survive. The most important of them was his *Life in Greece*, in which the moral, political, and social condition of the people was very fully discussed. Among the philosophical works of Dicæarchus may be mentioned the *Lesbiaci* in three books, in which the author endeavours to prove that the soul is mortal. This work is written in the form of a dialogue, and derived its name from the fact that the scene of the dialogue was laid at Lesbos. To it the author afterwards appended a supplement, likewise in three books, which he called *Corinthiaci.* The only complete edition of the fragments of Dicæarchus is that published at Darmstadt in 1841 by Max. Fuhr. An excellent dissertation on them will be found in Osann.

DICHOTOMY (διχοτομια, a division into two parts), in *Astronomy*, that phase of the moon in which it is bisected, or shows only half its disk. In this situation the moon is said to be in a quadrate aspect, or in its quadrature. The term is also used in botany to express a mode of branching by repeated bifurcation, as exemplified in the leaves of ferns.

DICOTYLEDONOUS, in *Botany*, a term applied to plants whose seeds have two lobes or cotyledons.

DICKER (probably from δεκα, *ten*), in our old writers, is used to denote the number or quantity of ten, particularly ten hides or skins, of which twenty made a last; and is sometimes applied to other things, as a dicker of gloves or ten pairs, a dicker of iron or ten bars, &c.

DICKINSON, Edmund (1624–1707), an English physician and chemist, was born at Appleby, Berkshire. He took his degrees at Merton College, Oxford; and in 1655 published his *Delphi Phœnicizantes*, a learned work, in which he attempted to prove that the Greeks borrowed the story of the Pythian Apollo, and all the legends with which the Delphic oracle was associated, from the Holy Scriptures. After practising at Oxford, Dickinson removed in 1684 to London, where he was appointed physician in ordinary to Charles II.; an office which he also held under James II. Dickinson was the author of a work entitled *Physica vetus et vera*, in which he endeavoured to construct a system of philosophy on principles collected from the Mosaic history.

DICTATOR, in *Antiquity*, the highest extraordinary magistrate of the Roman republic. The original name of this office was *magister populi*, by which appellation he was called in the sacred books down to the latest times of the commonwealth.

When the republican form of government was established at Rome, and the supreme executive vested in the two consuls, emergencies sometimes occurred in which it seemed that the safety of the state might advantageously be intrusted for the time to some one man, whose past life had gained for him the esteem and respect of the whole body of the citizens. The idea of this office was borrowed by the Romans from the constitution of some of the Latin towns which they had subdued. It lay with the senate to decide when the services of a dictator were necessary. The power of nominating a man to the office was by that body made over to one of the consuls. It is not exactly determined to which of these offices the nomination of a dictator properly appertained. Sometimes it was the consul who happened to have the fasces at the time; sometimes it was he who happened to be nearest the city; at other times the consuls themselves either drew lots or came to an agreement as to which of them should perform the duty. In any case the nomination of the consul was indispensable; and so important was it considered, that on one occasion when both the consuls refused to name a person for the dictatorship, the senate had recourse to the tribunes of the people, to whose influence the consuls were obliged to give way. On another occasion, when it was found impossible to communicate with the surviving consul, after the battle of the Thrasymenus, the senate and people were compelled to provide for the crisis by electing a pro-dictator.

As soon as the consul had fixed upon a properly qualified person, he took the auspices with much solemnity, and immediately afterwards issued his proclamation in due form. This latter ceremony required always to be performed some time between midnight and morning. As soon as the dictator was nominated, the *imperium* was conferred upon him, and the duties of his office were defined by a *lex curiata.* The insignia of his office were also immediately placed at his disposal. These were—first, the lictors, twenty-four in number, who bore the fasces and secures; second, the curule chair; and third, the toga prætexta.

The first dictator was appointed at Rome B.C. 501, nine years after the expulsion of the Tarquins. Who the first dictator was, is differently stated by different historians; but it is most probable that T. Lartius was the man, and that his nomination was rendered necessary by the prospect of a formidable war with the allied Latin states.

Dictators appointed, as T. Lartius was, to manage the foreign relations of the state, were said to be chosen *rei gerundæ causâ*, or *seditiones sedandæ causâ*; but it often happened that in matters of less importance than a foreign war, a dictator was appointed with nominal authority. This officer was generally selected in the absence of the consuls to perform some small ceremonies, which in strict propriety could only be gone through by one of the consuls. Thus a dictator was sometimes chosen to hold the comitia, to appoint holidays, to affix the *clavus annalis* in the temple of Jupiter, and to preside at trials.

As soon as the dictator was appointed, he was required to select a master of the horse (*magister equitum*), whose term of office was the same as his own. Should the master of horse die before the lapse of six months, it was necessary to appoint a successor. Like the dictator, to whom he was subject in all things, he received his commission by a *lex curiata*. In the absence of his principal, he was entitled to act independently, though he was always held responsible for any mismanagement that might occur under his command.

The power of the dictator was absolute; and so long as he remained in office no appeal was open against his mandates to any other authority in the state. He was nearly altogether independent of the senate. He could inflict much severer punishments than the consul without being liable, as these officers were, to have his sentence reversed by the assembly of the people. His power was as irresponsible as it was absolute. It is stated by Festus that an appeal could be made against the decrees of the dictator. This, however, seems to be a mistake on the part of that historian, for, in the only case which ever occurred to test that principle, the dictator (L. Papirius) denounced the appeal as incompetent to his accusers, from the tenure by which he held his office. In token of the absolute power of the dictators over the lives of their fellow-citizens, their lictors bore the axe in the midst of the fasces, even in their walks through the city—a mark of distinction which the consuls had formerly enjoyed, but which had been abolished in their case by the Valerian law.

Though the power of the dictators was thus great, it was, nevertheless, limited by certain indirect restrictions. The most important of these was, that the dictator had no control whatever over the public money, and had to content himself with such sums as were allowed him by the senate. He was not allowed to leave Italy; and could not appear on horseback in the city without the express permission of the people. The surest safeguard, however, against any treacherous designs on the part of the dictator was the shortness of the period during which he remained

 in office. This was never permitted to exceed six months: and if the crisis which had called for the election of a dictator passed over before the expiry of that period, it was expected that he would immediately resign.

When a dictator was appointed, all the ordinary magistrates ceased to be directly responsible to the governing authorities of the state, and took their orders directly from him. The only magistrates exempt from this necessity were the tribunes of the commons. The inferior officers, however, did not, as has been supposed, retire from office altogether. They merely obeyed the dictator so long as he continued in power, and on his resignation entered once more upon the untrammelled exercise of their authority.

It remains to be added that dictators were only appointed at Rome so long as Italy remained unsubdued. The last dictator appointed at Rome held office in B.C. 202: from that time the constitutional dictatorship disappears from Roman history.

DICTIONARY, in its original acceptation, is the arranging of all the words of a language according to the order of the alphabet, and annexing a definition or explanation to each word. When arts and sciences began to be improved and extended, the multiplicity of technical terms rendered it necessary to compile dictionaries, either of science in general, or of particular sciences, according to the views of the compiler.

DICTIONARY *of the English Language.* The design of every dictionary of language is to explain, in the most accurate manner, the meaning of every word; and to show the various ways in which it can be combined with others, in as far as this tends to alter or modify its meaning. The dictionary which does this in the most accurate manner is the most complete work of the kind; therefore the principal study of a lexicographer ought to be to discover the method which may seem best adapted for that purpose. Dr Johnson, with great labour, has collected the various meanings of every word, and quoted the authorities; but it would have been an improvement if he had given an accurate definition of the precise meaning of every word; pointed out the way in which it ought to be employed with the greatest propriety; showed the various deviations from the original meaning, which custom had so far established as to render allowable; and fixed the precise limits beyond which it could not be employed without becoming a vicious expression. With this view it would have been necessary to exhibit the nice distinctions which take place between words nearly synonymous, and without which many words can only be defined in such a manner that they must be considered as exactly synonymous. We omit making any quotations from Johnson in order to point out these defects; and shall content ourselves with giving a few examples, to show in what manner, according to our idea, a dictionary of the English language ought to be compiled.

IMMEDIATELY, *adv. of time.*

1. Instantly, without delay. Always employed to denote future time, and never past. Thus we may say, *I will come immediately;* but not *I am immediately come from such a place.* See PRESENTLY.
2. Without the intervention of any cause or event; as opposed to *mediately.*

PRESENTLY, *adv. of time.*

1. Instantly, without delay. Exactly synonymous with *immediately;* being never with propriety employed to denote any thing but future time.
2. Formerly it was employed to express present time. Thus, *The house presently possessed by such a one,* was often used, but this has now become a vicious expression; and we ought to say, *The house possessed at present.* It differs from *immediately* in this, that even in the most corrupt phrases it never can denote past time.

FORM, *subst.* The external appearance of any object, when considered only with reference to shape or figure. This term, therefore, in the literal sense, can only be applied to the objects of sight and touch, and is therefore nearly synonymous with *figure;* but these terms differ in some respects. *Form* may be employed to denote more rude and unfinished shapes; *figure,* those which are more perfect and regular. *Form* can never be employed without denoting matter, whereas *figure* may be employed in the abstract: thus we say a square or a triangular *figure,* but not a square or triangular *form.* And in the same manner we say the *figure* of a house; but we must denote the substance which forms that figure if we use the word *form;* as, *a cloud of the form of a house.* See FIGURE.

2. In contrast to irregularity or confusion. As beauty cannot exist without order, it is by a figure of speech employed to denote beauty, order, and the like.
3. As *form* respects only the external appearance of bodies, without regard to their internal qualities, it is, by a figure of speech, employed in contrast to these qualities to denote empty show, without essential qualities. In this sense it is often taken when applied to religious ceremonies, pageantry, and so forth.
4. As *form* is employed to denote the external appearance of bodies, so, in a figurative sense, it is applied to reasoning, denoting the particular mode or manner in which this is conducted; as, *the form of a syllogism,* &c.
5. In the same manner it is employed to denote the particular mode of procedure established in courts of law; as, *the forms of law, religion,* and the like.
6. *Form* is sometimes, although improperly, used to denote the different circumstances of the same body; as, *water in a fluid or a solid form.* But as this phrase regards the internal qualities rather than the external figure, it is improper, and ought to be, *water in a fluid or a solid state.*
7. But when bodies of different kinds are compared with one another, this term may be employed to denote other circumstances than shape or figure; for we may say, *a juice exuding from a tree in the form of wax or resin;* although, in this case, the consistence, colour, &c. and not the external arrangement of parts, constitutes the resemblance.
8. From the regular appearance of a number of persons arranged in one long seat, such persons so arranged are sometimes called a *form;* as, *a form of students,* &c. And,
9. By an easy transition the seat itself has also acquired that name.

GREAT, *adj.* A relative word, denoting largeness of quantity, number, &c., serving to augment the value of those terms with which it is combined, and opposed to *small* or *little.* The principal circumstances in which this word can be employed are the following:

1. When merely inanimate objects are considered with regard to quantity, *great* is with propriety employed to denote that the quantity is considerable: as, *a great mountain, great house,* and the like; and it is here contrasted with *small.* When *great* is thus employed, we have no other word which is exactly synonymous.
2. When inanimate objects are considered with regard to their extent, this term is sometimes employed, although with less propriety; as, *a great plain, a great*

field, and the like. In this sense it is nearly synonymous with *large;* and these terms were often used indiscriminately, but with some difference of meaning; for, as *large* is a term chiefly employed to denote extent of superficies, and as *great* more particularly regards the quantity of matter, therefore, when *large* is applied to any object which is not merely superficial, it denotes that it is the extent of surface which is there meant to be considered, without regard to the other dimensions; whereas, when the term *great* is employed, it has reference to the whole contents. If, therefore, we say *a large house*, or *a large river*, we express that the house, or the river, has a surface of great extent, without having any necessary connexion with the size in other respects. But if we say *a great house*, or *a great river*, it at once denotes that these objects have not only a large surface, but are also of great size in every respect.

3. *Great*, when applied to the human species, never denotes the size or largeness of body, but is applied solely to the qualities of the mind. Thus when we say that *Socrates was a great man*, we do not mean that he was a man of great size, but that he was a man who excelled in the endowments of the mind. The terms which denote largeness of size in the human body are *big, bulky, huge.*

4. *Great* is sometimes applied to the human species, as denoting high rank. In this case it is oftener used in the plural number than otherwise. Thus we say simply *the great*, meaning the whole body of men in high station, as opposed to the *mean*. It should seldom be employed in this sense, as it tends to confound dignity of rank with elevation of mind.

5. As this is a general term of augmentation, it may be joined with all nouns which denote *quantity, quality, number, excellence*, or *defects;* or such as imply *praise, blame, anger, contempt*, or any other affection of the mind.

6. It is employed to denote every step of ascending or descending consanguinity, as *great-grandfather, great-grandson*, and so on.

High, *adj.* Exalted in a perpendicular direction at a distance from the surface of the earth, and opposed to *low.*

1. *High* is a term altogether indefinite, and is employed to express the degree of elevation of any inanimate body. Thus we say *a high mountain, a high house, steeple, tower, pillar*, and the like. Nor is there any other word which can here be considered as synonymous; *lofty* being employed only to denote a very eminent degree of elevation.

2. To express the perpendicular elevation of vegetables either *high* or *tall* may be employed, as being in this case nearly synonymous. We may therefore say a *high* or *tall tree*, a *high* or *tall mast*, and so forth, but with this difference between these two expressions, that *tall* can be more properly applied to those which are much elevated and of small dimensions; and *high*, to such as are more bulky and of greater size.

3. The perpendicular height of man can never be expressed by the word *high, tall* being here the proper expression. And although *high* is sometimes used to express the height of other animals, yet it seems to be an improper expression. See Tall.

4. *High*, when applied to the human species, always refers to the mind, and denotes *haughtiness, stateliness, pride*, and when combined with expressions indicating energy of mind, it denotes that in a higher degree. In this sense it is opposed to *meanness, abjectness*, and *humility.*

5. As this is an indefinite term, tending to denote any thing which is elevated above us, it may be combined with almost every noun which admits of this elevation. Hence, as objects high above us are always out of our reach, it is in a metaphorical sense used to denote any thing which seems to be above the ordinary condition of mankind, or those qualities or endowments of mind which are not easily acquired; as, *dignity* or *elevation of sentiment, dignity of rank, acuteness in reasoning on difficult subjects, pride, haughtiness*, or any other quality which seems beyond the ordinary level of mankind; *dearness of price.*

6. In the same manner we apply this term to time, which having a metaphorical resemblance to a river flowing on with an unceasing current through all successive ages, any thing of remote antiquity is denoted by the term *high.*

7. Likewise to those degrees of latitude far removed from the line, where the pole becomes more elevated.

8. And also to some particular crimes, as being attended with peculiar degrees of guilt, as *high treason.*

Tall, *adj.*, signifies elevated to a considerable degree in a perpendicular direction: opposed to *low.*

1. This term is chiefly employed to express the height of man and other animals; and is applied to denote the height of the body only, without having any reference to the mind. When applied to man, no other word can be substituted in its stead; when applied to other animals, *high* is sometimes considered as nearly synonymous. See High.

2. It is likewise employed to denote the perpendicular height of vegetables, and in this case it is nearly synonymous with *high.* See High.

3. It can in no case be employed to express the height of merely inanimate objects, as we can never say a *tall steeple, tower*, or *pillar*, but a *high steeple*, &c. For the distinctions in these cases, see High.

Long, *adj.* A relative term, denoting the distance between the extremes of any body which is extended more in one of its geometrical dimensions than in another. It is opposed to *short.*

1. This term may be applied to all inanimate objects, of whatever kind, whose dimensions in one way exceed their dimensions in the other, and when not in an erect posture, whatever be the other circumstances attending them, whether it relates to superficies alone or to solid bodies, whether these be bounded or open, straight or crooked, flexible or rigid, or in any other circumstances whatever: thus we say *a long* or *short line, a long* or *short ridge, street, ditch, rope, chain, staff*, and the like. But it is to be observed, that although *long* is in the strict sense only opposed to *short*, yet as it expresses the extension of matter in one of its geometrical proportions, it is often contrasted by those words which express the other proportions when we mean only to describe the several proportions; as, *a table long and broad.* And as these several dimensions are expressed by different words, according to the various forms, modifications, and circumstances in which bodies are found, therefore it is in this sense contrasted by a great diversity of terms; as, *a long and broad* or *wide, narrow* or *strait, street* or *lane; a long and thick* or *small rope, chain, staff.* For the distinctions in these cases see Broad, Wide, &c.

2. Objects necessarily fixed in an erect position can never have this term applied to them, and therefore we cannot say *a long*, but a *high tower* or *steeple.* And for the same reason, while trees are growing and fixed in an erect position, we cannot apply this term to them; but when they are felled and laid upon the

ground, it is quite proper and necessary. Thus we do not say *a long*, but *a tall* or *high tree*, while it is growing; but we say *a long*, not *a tall log of wood;* and in the same manner we say *a tall mast* when it is fixed in the ship, but *a long mast* while it lies upon the beach. See TALL and HIGH.

3. Those vegetables which are of a tender, pliant nature, or so weak as not to be able to retain a fixed position, being considered as of a middle nature between erect and prostrate bodies, admit of either the terms *long, tall*, or *high;* as, *a long* or *tall rush* or *willow wand*, or *a long, tall*, or *high stalk of corn*. See HIGH and TALL.

4. The parts of vegetables, when considered as distinct from the whole, even when growing and erect, assume the term *long;* for we do not say *a tall*, but *a long shoot of a tree*, and *a tree with a long stem*, in preference to *a tree with a high stem*.

5. For the same reason, a staff and pole, even when fixed in a perpendicular direction, assume the word *long*, in preference to *tall* or *high*.

6. With regard to animals, the general rule is applied, without any exceptions; *tall*, and not *long*, being employed to denote the height of the human body when in an erect posture; and *long*, and not *tall*, to denote its length when in an incumbent situation. *Long* applied to all other animals which do not walk erect, always denotes their greatest length in a horizontal position from head to tail.

7. In a figurative sense, it denotes, with regard to time, any thing at a great distance from us.

8 As also, any thing that takes up much time before it is finished, as, *a long discourse, a protracted note in music*, and the like.

BROAD, *adj.*, denotes distance between the two nearest sides of a body whose geometrical dimensions are larger in one direction than in another. It has a reference to superficies only, and never to the solid contents, and is opposed to *narrow*.

1. *Broad*, in the strictest acceptation, is applied to denote those bodies only whose sides are altogether open and unconfined; as, *a broad table, a broad wheel*, &c. and in these cases it is invariably contrasted with *narrow;* nor is there any other word which in these cases can be considered as synonymous with it, or be used in its stead.

2. When any object is in some sort bounded on the sides, although not quite closed up, as a road, street, ditch, and the like, either *broad* or *wide* may be employed, but with some difference of signification; *broad* being most properly used for those which are more open, and *wide* for those which are more confined: nor can this term be ever applied to such objects as are closely bounded all around, as a house, a church, and the like, *wide* being here employed. For the more accurate distinctions in these cases see the article WIDE.

WIDE, *adj.* A term employed to denote relative extent in certain circumstances, and opposed to *narrow* and *strait*.

1. This term is in its proper sense applied only to denote the space contained within any body closed all round and on every side; as, a house, gate, or the like; and it differs from *broad* in this, that it never relates to the superficies of solid objects, but is employed to express the capaciousness of any body which contains vacant space; nor can capaciousness in this sense be expressed by any other word but *wide*.

2. As many bodies may be considered either with respect to their capaciousness or superficial extent, in all these cases either the term *broad* or *wide* may be used; as, *a broad* or *wide street* or *ditch*, &c.; but with a greater or less degree of propriety, according to the circumstances of the object, or the idea which we wish to convey. In a street where the houses are low and the boundaries open, or in a ditch of small depth and large superficies, as this largeness of superficies bears the principal proportion, *broad* would be more proper; but if the houses are of great height, or the ditch of great depth, and capaciousness is the principal property which affects the mind, we would naturally say *a wide street* or *ditch;* and the same may be said of all similar cases. But there are some cases in which both these terms are applied, with a greater difference of meaning; thus we say *a broad* or *a wide gate*. As the gate, however, is employed to denote either the aperture in the wall, or the matter which closes that aperture, these terms are each of them used to denote that particular quality to which they are generally applied; and as the opening itself can never be considered as a superficies, the term *wide*, in this case, denotes the distance between the sides of the aperture; whilst, on the contrary, *broad* denotes the extent of matter fitted to close that aperture; nor can these two terms be in any case substituted for one another.

3. As a figurative expression, it is used as a cant phrase for a mistake; as, *you are wide of the mark;* that is, not near the truth.

NARROW, *adj.* A relative term, denoting a proportional smallness of distance between the sides of the superficies of plain bodies, and opposed to *broad*.

1. As this is only applied to superficies, it is exactly contrasted by *broad*, and is applied in all cases where the term *broad* can be used (see BROAD); and in no other case but as a contrast to it, excepting the following.

2. It sometimes is employed to describe the smallness of space circumscribed between certain boundaries, as opposed to *wide*, and nearly synonymous with *straight;* thus we say *a wide* or *a narrow house, church*, and the like. For the necessary distinctions here, see the article STRAIT.

3. In a figurative sense it denotes *parsimony, poverty, confined sentiments*, and so forth.

STRAIT, *adj.* A relative term, denoting the extent of space in certain circumstances, and opposed to *wide*. See WIDE.

1. This term is employed, in its proper sense, to denote only space, as contained between surrounding bodies in such circumstances as to denote some degree of confinement, and is exactly opposed to *wide;* as, *a wide* or *a strait gate*, &c. See WIDE.

2. So necessary is it that the idea of confinement should be connected with this word, that in all those cases where the space contained is large, as in a church or house, we cannot express a smaller proportional width by this term. And as we have no other word to express space in these circumstances, we are obliged to force the word *narrow* from its natural signification, and make it express this. See NARROW.

3. In some particular cases, *narrow* or *strait* may be applied to the same object; as, *a narrow* or *a strait line;* but here *strait* is never employed except where an idea of confinement is suggested, and where it is exactly contrasted to *wide;* nor can *narrow* be employed except in such circumstances where *broad* would be a perfect contrast to it. Therefore these two terms may be always used in the same circumstances as those which contrast with them. For an account of these see WIDE.

4. The term *strait* is likewise in a peculiar manner used to denote the smallness of the internal diameter of those bodies which are fitted to receive or contain others, as any kind of bag, tube, body clothes, mortises, and others of the same kind; and in all these cases this term may be employed to denote the smallness of their lesser diameter, and never the term *narrow*. But in certain circumstances the word *tight* may be substituted for it. See TIGHT.

5. *Strait*, in a figurative sense, denotes any sort of confinement of sentiment or disposition.

TIGHT, *adj.* A term employed in certain circumstances to denote the internal capacity of particular bodies, and nearly synonymous with *strait*.

This term is confined entirely to denote the smallness of the internal dimensions of such objects as are formed to cover, or to receive or contain, other solid bodies, and can be employed in no other case. And although it agrees with *strait*, in always denoting confinement, and by being applicable to the same species of objects, yet it differs in the following respects: 1. If there be any difference of the diameter of the objects to which the term *strait* can be applied, it has always reference to the smaller; yet *tight* may be applied to any sort of confinement, whether it regards the length or breadth. 2. *Strait* can be applied to all bodies of capacity when of small diameter, without any sort of reference to the nature of the substance which it may be capable of containing. For we can say *a strait bag, a strait sleeve, a strait mortise, a strait gate*, and so on, whereas *tight* can only be applied to any body when it is considered as having reference to another body which is intended to be contained in it, and is pinched from want of room. Thus we say *the sleeve of a coat is too tight for the arm, the mortise is too tight for the tenon*, and so forth; but we cannot say *the bag* or *the gate is too tight*, because they are fitted to receive any sort of objects. And hence it happens that in many cases the dimensions of the same body may be expressed by *tight* or *strait*, when considered in different circumstances. Thus we may say, *this sleeve is too strait*, when we look at a coat lying on the table and consider its proportions; but it is not till we have tried it upon the arm which it is intended to cover, that we call it *tight*. And we may say, *a gate is too strait* or *too tight;* but in the first case we consider it as being too confined for admitting objects to pass through it; and in the next, as being too confined with respect to the "leaves" which are to shut the aperture not allowing them space to move with freedom.

These examples may serve to give some idea of the plan of an English dictionary composed upon philosophical principles. But, besides the circumstances above enumerated, there are many others which would require particular attention in the execution of a work of this kind. In the English language a great variety of terms occur which denote matter under certain general forms or circumstances, without regarding the minute diversities that may take place; as the word *cloth*, which denotes matter as manufactured into a particular form, including under it all the variety of stuffs manufactured in that particular way, of whatever materials, colour, texture, or fineness they may be. The same may be said of *wood, iron, yarn*, and a great variety of terms of the same nature, some of which cannot assume any plural; whilst others admit of it in all cases, and others, again, admit or refuse it according to the different circumstances in which they are considered.

In a dictionary, therefore, all this variety of cases ought to be clearly and distinctly pointed out under each particular article. This is the more necessary, as some of these words have others formed from them which might be readily mistaken for their plurals, although they have a very different signification; as *clothes*, which does not denote any number of pieces of different kinds of *cloth*, but *wearing apparel*. The following example will illustrate this head.

WOOD, *subst.* A solid substance of which the trunks and branches of trees consist.

1. This term is employed to denote the solid parts of vegetables of all kinds, in whatever form or circumstances they are found. Nor does it admit of a plural with propriety, unless in the circumstances after mentioned; for we say, *many different kinds of wood*, in preference to *many kinds of woods;* or we say, *oak, ash*, or *elm wood*, not *woods*.

2. But where we want to contrast wood of one quality or country with that of another, it admits of a plural; for we say, *white woods are in general softer than red;* or, *West Indian woods are in general of greater specific gravity than the European woods.* But unless where the colour, or some quality which distinguishes it from growing wood, is mentioned, this plural ought as much as possible to be avoided, as it always suggests an idea of growing wood.

3. *Wood* likewise denotes a number of trees growing near one another, being nearly synonymous with *forest*. See FOREST. In this sense it always admits of a plural; as, *Ye woods and wilds whose melancholy gloom*, &c.

A dictionary cannot be reckoned complete without explaining obsolete words; and if the terms of the several provincial dialects were likewise given, it would be of great utility. Nor would this occupy much space, because a number of these words need no other explanation than to mark along with them the words which had come in their place, when there happened to be one perfectly synonymous; and in those cases where the same idea could not be expressed in modern language without a periphrasis, it would be of use to explain them distinctly; so that, when a writer found himself at a loss for a term, and was obliged to search for one beyond the bounds of his own language, he might take one of these, if he found it expressive and energetic, in preference to another drawn from a foreign language. This would at least have one good effect; it would render our language more fixed and stable, not to say more accurate and precise, than by borrowing from foreign languages. The following examples may serve to give some idea of the manner of treating this part of the work.

MOE, or MO, *adj.* An obsolete term still employed in the Scotch dialect, and by them pronounced *mae*, denoting a greater number, and nearly synonymous with *more;* but it differs in this respect, that in the Scotch dialect, *mae* and *mair* (English *more*) are each employed in their distinct sphere, without encroaching upon one another, *mae* being employed to denote number, but never quantity or quality, and *mair* to denote quantity and quality, but never number; thus they say *mae*, not *mair, apples, men*, &c. and *mair*, not *mae, cloth, earth, courage*, &c. See MAIR. Both these terms are supplied by the word *more*, which in the English language is applied indiscriminately to denote quantity, quality, and number. See MORE.

As the English language is so exceedingly irregular in the pronunciation, the same letter in the same situation often assuming sounds totally different in different words, it is impossible to establish any general rules on this subject which do not admit of many exceptions; therefore a

dictionary is the best means of ascertaining and pointing out the proper pronunciations of words. For, if the writer first pointed out all the different sounds which the same letter could ever be made to express, and assigned to every particular sound which each letter could be made to assume, a particular mark, appropriated to denote that particular sound of the letter whenever it occurred, by placing these particular marks above the letters in the dictionary, the sound of each letter would be pointed out in all cases with the utmost certainty. It is impossible to illustrate this by examples, without first ascertaining all the sounds of each letter, which would lead into a discussion too long for this place.

We shall only further observe, that besides having the accented syllable of every word *properly* distinguished in a dictionary to assist in the pronunciation, the English language requires another essential improvement, namely, the use of accents to distinguish the meaning of *words* and *phrases*, which, although it is not so properly confined to a lexicographer, yet it is not quite without his sphere. Thus, the word *as* admits of two very different sounds, as well as different significations; for example, "Cicero was nearly *as* eloquent *as* Demosthenes;" in which the first *as* is pronounced *ass*, and the last is pronounced *az*. Now it often happens that, in reading, the particular way in which it ought to be understood is not pointed out by the context till after the word itself is pronounced, which has an equal chance at least of being pronounced wrong; whereas, if it were always accented when employed in the one sense, and not in the other, it would free the reader from this perplexity. There are other cases in which the proper use of accents in writing would be of great consequence; as at the beginning of a sentence when it is put as a question, or used ironically. But this does not so properly belong to the lexicographer as the grammarian.

The above examples, we hope, will be sufficient to give the reader some idea of the plan which we would propose, and will enable him to determine whether or not a dictionary, executed in this way, would convey to his mind a more perfect knowledge of the English language than those dictionaries which have hitherto been published. These examples are given rather with a view to show the manner in which a work of this kind may be conducted, than as perfect and unexceptionable explanations of the several articles there enumerated; and therefore we have not thought it necessary to produce any authorities, although we are sensible that they would be requisite in such a work.

The following is a list of the principal dictionaries in the various ancient and modern languages:—

Aegyptian.—Sharpe (Lond. 1837); Birch (Lond. 1838); J. F. R. Champollion (Paris 1841); Tattam (Lond.)
Aethiopian.—Wemmers (Rome 1638); Ludolf (Frankf. 1699).
Afghan.—Dorm (St Petersburg 1845).
Albanian.—Blanchus (Rome 1635); Kaballioti (Venice 1770); Xylander (Frankf. 1835).
Amharic.—Ludolf (Frankf. 1698); Bruce (Lond. 1805); C. W. Isenberg (Lond. 1841).
Anglo-Saxon.—Somner (Oxon. 1659); Benson (Oxon. 1701); Lye (Lond. 1772); Bosworth (Lond. 1838).
Angola.—De Cannecattim (Lisb. 1804).
Arabic.—Gieuharrius (Scutari 1802); Richardson and Johnson (Lond. 1829); Baretti (Calc. 1806); Freytag (Halae 1837); Ciadyrgy (Milan 1832); De Biberstein Kazimirski (Paris 1846).
Vulgar Arabic.—Germanus de Silesia (Rome 1639); Cañes (Madrid 1787).
Aramaic.—Buxtorf fil. (Basil 1648).
Armenian.—Aucher (Venise 1817); translated into English by Brand (Venice 1825).
Bengalee—Forster (Calc. 1802); W. Carey (Seramp. 1826); J. C. Marshman (Seramp. 1827); Ch. Haughton (Lond. 1833); Ram Comul Sen (Lond. 1835).
Biscayan.—Anonymous (Bayonne 1706); De Larrimandi (St Sebastian 1745).
Bohemian.—Tomsa (Prag. 1791); Jungman (Praze 1839).
Burman.—Hough (Seramp. 1825); Judson (Calc. 1826).
Chaldee.—Elias Levita (Col. Agr. 1560); Buxtorf (Argenton 1639); Landau (Prag. 1820).
Chinese.—Morrison (Macao 1823); Medhurst (Batav. 1842); Biot (Paris 1842); Callery (Macao 1845).
Cinghalese.—Clough (Colombo 1830); Callaway (Colombo 1821).
Cochin Chinese.—De Rhodes (Rome 1651); Taberd (Serampore 1838); Du Ponceau (Philad. 1838).
Coptic.—Kircher (Rom. 1644); Lacroze (Oxon. 1775); Parthey (Berlin 1844).
Danish.—Anonymous (Leipzig 1844).
Dutch.—Hexham & Manley (Rotterd. 1675); Werninck (Lond.)
English.—Phillips (Lond. 1678); Bailey (Lond. 1764); Johnson (Lond. 1755); Sheridan (Lond. 1789); Ash (Lond. 1795); Booth (Lond. 1835); Webster (Lond. 1842); Richardson (Lond. 1836).
Esquimaux.—Egede (Hafn. 1750); Fabricius (Copen. 1804).
Finnish.—Renvall (Aboae 1826).
French.—Dictionnaire de l'Académie Françoise; Boyer; Chambaud; Fleming and Tibbins; Spiers; Tarver.
Gaelic.—Macfarlane (Lond. 1815); Armstrong (Lond. 1825); Highland Society (Edin. 1828); M'Leod and Dewar (Glasgow 1831); M'Alpine (Edin. 1845).
Georgian.—Klaproth (Paris 1827).
German—Bailey (Jena 1823); Hilpert (Karlsr. 1839); Flügel (Leipzig 1838); Grieb (Lond. 1847).
Gothic.—Lye (Lond. 1772); Ulfilas (Leipzig 1843).
Greek.—Hesychius (Lug. Bat. 1746); Suidas; Hederich; Passow; Pape; Dunbar; Liddell and Scott.
Hawaii.—Andrews (Cahainaluna 1836).
Hebrew.—Buxtorf (Basil 1735); Cocceius by Schulz (Leip. 1777–95); Gesenius (Leip. 1846), Edited by Tregelles (Lond. 1846); Parkhurst (Lond. 1823); Robinson (Boston 1844); Lee (Lond. 1840); Fürst (Leip. 1842).
Hindee.—Rousseau (Lond. 1812); Adam (Calc. 1833).
Hindustanee.—Roberts (Lond. 1800); Taylor (Calc. 1808); Gilchrist by Roebuck (Lond. 1825); Shakspeare (Lond. 1834).
Irish.—Maccurtin (Paris 1732); Shaw (Lond. 1780); O'Reilly (Dublin 1822); O'Brien (Dublin 1832).
Icelandic.—Haldorsonius (Copen. 1814).
Italian.—Veneroni; De la Crusca; Baretti; Graglia; Meadows.
Japanese.—Medhurst (Batav. 1830); De Sibold (Lugd. Bat. 1835); Medhurst (Lond.)
Latin.—Forcellini and Facciolati; Scheller (Leip. 1805); Freund (Berlin 1845); Georges (Leip. 1843); Riddle (Lond. 1851); Andrews (Lond. 1852).
Lettish.—Steuder (Riga 1791).
Malay.—Anonymous (Amster. 1802); (Arnheim 1803).
New Holland.—Meyer (Adelaide 1843); Schürmann (Adelaide 1844).
New Zealand.—Kendal (Lond. 1820).
Norwegian.—Hallager (Copen. 1802); Hanson (Copen. 1840).
Oordoo.—Thompson (Lond. 1842.)
Persian.—Richardson and Johnson (Lond. 1829); Burhani Kati (Calc. 1818); Rousseau (Lond. 1802); Baretto (Calc. 1806); Ciadyrgy (Milan 1802); Samachscharius by Wetzstein (Leip. 1845).
Polish.—Schmidt (Breslau 1834); Troyanski (Berlin 1838); Czarnecki (Krotoshin 1843).
Portuguese.—Vieyra, ed. by Cunda (Lond. 1840); Wagener (Leip. 1812).
Provençal.—Raynouard (Paris 1843).
Rabbinic.—Buxtorf (Basil 1735); Otho (Altona 1757); Hornheim (Halle 1807); Landau (Prag. 1819–24).
Russian.—Schmidt (Breslau 1836); Reiff (St Petersburg 1836); Constantinon (Lond.)
Samaritan.—Castelli; Cellarius (Frankf. 1705); Otho (Frankf. 1735); Uhleman (Leipzig 1837).
Sanscrit.—Wilson (Calc. 1832); Yates (Calc. 1820); Haughton (Lond. 1833); Johnson (Lond.)
Scotch.—Brown (Edin. 1845); Jamieson (Edin. 1846).
Swedish.—Granberg (Orebro 1832).
Semitic.—Hottinger (Frankf. 1661); Castelli (Lond. 1669); Otho (Frankf. 1702).
Spanish.—Real Academia Española (Madrid 1844); Neumann and Baretti (Lond. 1823); Meadows (Lond. 1843).
Syriac.—Schaaf and Leusden (Lugd. Bat. 1717); Castelli by Michaelis (Göttingen 1788); Kirschius (Lipsiae 1836–41); Roediger (Hal. Sax. 1838).
Tamil.—Rottler (Lond.)
Telugu.—Campbell (Madras 1821); Morris (Madras 1835).
Tibetan.—Schroeter by Carey (Serampore 1826); Croma de Körös (Calc. 1834); Schmidt (St Petersburg 1841).

Turkish.—Ciadyrgy (Milan 1834); Kieffer (Paris 1837); De Haudjeri (Moscow 1842).

Welsh.—Owen (Lond. 1803); Lewis (Caermarthen 1805); Roberts (Lond. 1827); Pughe (Lond. 1832); Richards (Lond. 1839); Jones (Lond. 1840); Walter (Lond.)

See J. S. Vater's *Litteratur der Grammatiken, Lexica und Wörtersammlungen aller Sprachen der Erde;* zweite ausgabe von B. Jülg. Berlin 1847.

DICTYNNIA, in *Antiquity*, a festival with sacrifices celebrated at Cydonia in Crete and also at Sparta, in honour of Diana, surnamed Dictynnia; or, according to others, in honour of a nymph taken for her, who, having plunged into the sea to escape the passion of Minos, was caught in a fisherman's net (δίκτυον); whence the name.

DICTYS CRETENSIS, one of the early historians from whom the later Roman grammarians imagined that Homer derived materials for the Iliad and Odyssey. He is said to have followed Idomeneus, king of Crete, in the Trojan war; and the MS. of his work, written in Phœnician characters, was found in his tomb at Gnossus in the reign of Nero, and translated into Greek by order of that prince. A Latin version of the first five books has alone come down to us; but this work is generally regarded as a forgery. The best editions are those of Perizonius and Dederich.

DIDACTIC (διδασκω, *to teach*), signifies the manner of speaking or writing adapted to teach or explain the nature of things.

There are many words which are only used in the didactic and dogmatic way; and there are also many works, ancient and modern, both in prose and verse, written after this method; such as the Georgics of Virgil, Lucretius's poem *De Rerum Natura*, Pope's Essays on Criticism and on Man, &c.

DIDEROT, DENIS, a French writer and philosopher, was the son of a cutler, and born at Langrès in Champagne, in 1713. He received his early education among the Jesuits at the college of that order in his native town, and afterwards at the college D'Harcourt at Paris. At first he was destined for the church, one of his relatives having a canonry to bestow upon him. But he discovered little inclination for the ecclesiastical profession, and his father placed him with an attorney. It soon appeared, however, that he was more attached to a general and desultory pursuit of literature and science than disposed to submit to the drudgeries of the profession to which his father had destined him; and having neglected its duties, his allowance was withheld, and he was obliged to shift for himself. It is said he gave lessons in order to procure a subsistence; and also became a bookseller's hack, in which capacity, we are told, nothing came amiss to him, from an advertisement or a catalogue to a sermon. Certain it is, that the studies to which Diderot devoted his attention were extremely various. Physics, geometry, metaphysics, moral philosophy, and belles-lettres, were at different times the objects of his pursuit; and he even indulged in poetry and works of fiction. But he attached himself chiefly to the graver studies. He possessed great fluency and animation of language in conversation; and this accomplishment, with a decisive tone and manner, procured him both partizans and protectors. The species of reading to which he addicted himself, more various than profound, probably suggested to him those encyclopædic projects and labours which principally occupied his life, and by which he is chiefly remembered.

In the year 1745 he published *L'Essai sur le Merite et la Vertu*, 12mo, a work by which he obtained some reputation. The year following he published a piece entitled *Pensées Philosophiques*, and immediately acquired considerable celebrity. This work, though intrinsically of little merit, was highly commended by the partizans of the new philosophy, amongst whom he had enlisted himself. The same work was afterwards reprinted under the title of *Etrennes aux Esprits Forts;* it was very much read, and is supposed to have contributed greatly to the diffusion of those free-thinking opinions which had now become so prevalent in France. Soon after this period, Diderot, in conjunction with D'Alembert, concerted the plan of that vast undertaking, the *Dictionnaire Encyclopédique*. The professed object of this work was to form a magazine of every branch of human knowledge; it has been also alleged that it was intended by the authors and editors as an engine by means of which those established opinions, whether of a religious or political nature, which they were pleased to suppose had their origin in fraud and superstition, were to be subverted. The department of this work which was intrusted to Diderot was the description of arts and trades (*arts et métiers*). In fact, he was the principal architect of the edifice; and, besides the Prospectus, and the *Système des Connaissances Humaines*, which has been much commended for its classification, he contributed many articles in various departments of science. But his articles have been considered extremely verbose and diffuse; in many of them he is pedantically prodigal of metaphysical subtilties, and indulges in a pompous parade of scientific language. The first two volumes of the Dictionary appeared in the year 1751, and the first edition was completed and published in 1765, in 17 vols. fol. and 11 vols. of plates; but although Diderot was occupied in this laborious undertaking for a period of nearly twenty years, the recompense which he obtained for his labours is said to have been extremely small. He himself acknowledged the many defects of the work, not a few of which he attributed to the publisher Le Breton, who, he declared, often played editor himself, scratched out anything which he thought might compromise him, and filled up the chasms as he best could. Diderot's literary labours, however, were not confined to the Dictionary. Just before he commenced, and while engaged upon it, he composed numerous works, amongst which may be mentioned—(1.) *Lettres sur les Aveugles* (1749), "for the use of those who see." This work made a good deal of noise, and, in consequence of some of the sentiments it contained, gave offence to the government, for which reason the author was detained in confinement during several months at Vincennes. (2.) *Lettres sur les Sourds et Muets*, 2 vols. 12mo, 1751. (3.) The *Sixth Sense*, which was published in 1752. (4.) *Pensées sur l'interpretation de la Nature*, which appeared in 1754. These, which by no means exhaust the list, are similar works, and may be ranked in the same class. Like all his philosophic writings, they are (besides graver defects) often chargeable with the double fault of obscure thoughts expressed in a declamatory style.—His moral character was considerably affected by the publication of *Bijoux Indiscrets*, in two vols. 12mo, which is a collection of licentious tales; and it was little compensation that his two prose comedies, entitled *Le Fils Naturel*, 1757, and *Le Père de Famille*, 1758, comparatively uninteresting as dramatic pieces, exhibit a more correct morality. He also published a pamphlet on Public Education, which contains some useful hints, but at the same time proposes many things utterly absurd and impracticable. To the works now mentioned we may add an eulogy on Richardson, which is full of admiring enthusiasm. An Essay on the Life and Writings of Seneca the Philosopher was his last production, and was published in 1779. For a fuller and tolerably impartial account of these and his other writings, we must refer the reader to the *Biographie Universelle*.

The character of Diderot suffered considerably from some defamatory attacks which he had made on his former friend Rousseau, who had quarrelled with the French philosophers, and had separated himself from their school. From the *Confessions* of the philosopher of Geneva, it would appear that they expected of him some anecdotes which would not have redounded much to their honour. In one of his letters Rousseau, speaking of Diderot, says, "Although

born with a good heart and an open disposition, he had an unfortunate propensity to misinterpret the words and actions of his friends, and the most ingenuous explanations only supplied his subtle imagination with new interpretations against them." Rousseau might here be supposed drawing his own portrait yet more truly than that of his *quondam* friend.

Diderot was married and had one daughter; and although he possessed considerable irritability of temper, he was, it is said, a kind husband and a tender parent. His conjugal virtues are not, however, supposed to include fidelity. His sentiments on marriage sufficiently appear in the article on that subject in the Encyclopædia; and his numerous infidelities to his wife, who is said to have been virtuous and affectionate, show how consistently he exemplified them!

At the conclusion of the Dictionary, the state of his affairs having rendered it necessary for him to dispose of his library, it was purchased by the empress of Russia, who, with the king of Prussia, was at that time much given to patronize literature and literary men. These sovereigns were also considered as disciples of the French school. The price which Diderot received for his library was fifteen thousand livres, and he was to have the use of it during his life; or rather Catherine paid him many years' pension in advance, as *librarian* of his own library. "Elle acheta," says the *Biographie Universelle*, "en 1765, la bibliothèque de Diderot, pour 15,000 livres, à condition qu'il continuerait d'en jouir. Elle y ajouta une pension annuelle pour l'entretien et la garde de la bibliothèque; et ayant appris, l'année suivante, que le paiement de cette pension avait été retardé, elle lui en fit compter, cinquante années." Diderot was so charmed with Catherine's liberality, that he repaired to St Petersburg to express his gratitude; and then, dazzled with his reception, expressed it in terms which sound odd enough in a philosopher of *his* professed principles. "In a country," he declared, "*called* a country of slaves, he felt like a freeman." On his return he lodged in state in the Rue Richelieu at Catherine's charge. Diderot had been admitted a member of the Academy of Sciences at Berlin; but the doors of the French Academy remained closed against him to the last. He died suddenly, as he rose from table, on the 30th July 1784. According to his daughter, who left a memoir of him, he conversed on the evening preceding his death on philosophy, and the means of attaining it. She says the last remark she heard him make was, "The first step towards philosophy is incredulity." If so, he had certainly taken *that* step. Whether he had taken any other may be doubted. His literary and philosophical works were collected and published by his friend and disciple Naigeon, in 15 vols. 8vo, at Paris, in 1798. This collection has been enlarged, in subsequent republications, to 22 vols. 8vo, Paris, 1821; it contains a memoir of Diderot, or rather a critique on his writings.

Diderot, it would seem, had a hand in several of the most remarkable works of his time, published under the names of others. "Who does not know," says Grimm, in his *Correspondance*, "that nearly a third of the *Histoire Philosophique* of Raynal belongs to him? He laboured on it during two years, and a considerable part of it was even composed under my own eyes. Diderot himself was often startled at the boldness with which he had made his friend the abbé speak. 'Who,' asked he, 'who will venture to subscribe this?' 'I,' replied the abbé, 'I will subscribe it; proceed, I tell you.' What man of letters is there who may not easily recognise in the book *De l'Esprit* (of Helvetius), and in the *Système de la Nature*, all those fine passages which are, and could only be, from the pen of Diderot? If we undertook to make a more complete enumeration, we should run the risk of naming many ungrateful individuals." (*Correspondance Littéraire, Philosophique, et Critique*, tom. iv. p. 85.) Grimm further states that Diderot furnished a considerable number of pages to the *Système de la Nature*; and that he laboured, though to a less extent, on the *Système Social* and the *Morale Universelle*, also published by Baron d'Holbach. Such were some of the indirect literary efforts of Diderot. But neither as a writer nor as a philosopher did he make for himself any very enviable reputation. As a writer he was decidedly a vicious model; he had neither plan nor connection, and knew not how *proprie communia dicere*, whilst his style was deformed by obscurity, neologisms, and a tone of insufferable dogmatism; nevertheless it must be conceded that he was often vigorous, sometimes eloquent, and now and then stumbled on happy traits of expression; as well as striking truths, which, however, would have gained much by being more simply stated. In fact, he had frequently the air of speaking *ex cathedrâ;* his ambitious diction, his strained style, his eccentric sallies, and an enthusiasm which seldom appeared natural, fatigue the reader. As a philosopher he wrote under the influence of a heated imagination rather than under that of cool reason. He was almost always extravagant; seldom or never simple and natural. Admirers, however, have not been wanting who have celebrated his *bonté*, his frankness, his easy and obliging character, and the vigour and *entraînement* of his conversation. Grimm, who has praised him warmly in his *Correspondance*, regards Diderot as having had the most naturally encyclopædiacal head of all men that ever lived. He admires his energy, the variety of his ideas, the multiplicity of his acquirements, the impetuous tumult of his imagination, and the charm and irregularity of his conversation: but he adds, "However willingly I may pardon all men for *believing nothing*, I think that it would have been very desirable for the reputation of Diderot, perhaps even for the honour of his age, if he had not been an atheist. The determined war which he thought himself obliged to carry on against God, caused him to lose the most precious moments of his life." (*Correspondance*, 3me partie, tom. iv. p. 87.) But Naigeon, who is less scrupulous than Grimm, praises his friend without qualification, adding, besides, that "his age has not done him justice." It would have been difficult.

The general opinion in regard to him seems now to be pretty well fixed, and posterity has at length put him in his right place. He had talent; but he wanted sagacity, moderation, and taste. "He has written fine pages," says Marmontel in his *Mémoires*, "but he never knew how to make a book." His desolating atheism and licentious principles explain the reason why he never entered the Academy, whose doors, as we have already stated, were constantly shut against him, notwithstanding the anxious desire of his friends to procure him admission. Voltaire, who had himself solicited his election, appears latterly to have become less enamoured of the merit of Diderot, and even to have formally censured some of his works. D'Alembert also cooled towards him, and at last they did not even see each other. His rupture with Rousseau, however, was the work of the latter, who began the war which was afterwards waged between them. But Diderot maintained his connection with Baron d'Holbach, whose sentiments approached the nearest to his own. In the society of the baron he was relished and admired for his facility in general conversation, but especially, no doubt, on account of his antipathy to that creed and to those institutions which that coterie so cordially hated. On these topics he never tired, and his friends often amused themselves with giving him opportunities of abandoning himself to his imagination, or, in other words, blaspheming for their diversion. In an unexcited state he exhibited constraint, awkwardness, timidity, and even a kind of affectation. He was never truly Diderot except when his fancy had transported him as it were beyond himself. Enthusiasm had become the condition most natural to his mind, nay, even to his voice and fea-

tures; and he was himself only when in a state of intellectual inebriety. Grimm has reproached him with having consumed in fugitive conversations the time which he might have devoted to more enduring achievements; but Diderot loved to talk, especially when he could indulge his vehement volubility without interruption. As Voltaire once remarked on leaving a company where Diderot had engrossed the whole talk, "*Cet homme-là n'est pas propre pour le dialogue.*" The correspondence recently published has thrown but little new light on the character of this remarkable man, nor has it tended in any degree to increase the estimation in which his talents and character were previously held by the world. He will retain an unenviable notoriety as one of the principal figures in that group of so-called philosophers of the last century who, unable to distinguish between superstition and religion, vainly strove to extinguish religion itself, and entered into an unhallowed conspiracy against the best interests of humanity. Their fantastical theories, licentious maxims, and, too generally, immoral characters, constitute the best antidote to their absurdities, and the best comment on their systems.

DIDIER, St, a city of the department of the Upper Loire, in France, with 3203 inhabitants, who are employed chiefly in the silk manufacture.

DIDO, or Elisa, in *Ancient Mythology*, the reputed founder of Carthage, was the daughter of Mutgo (or as he is called by others Belus or Agenor) king of Tyre. On the death of this prince Dido married his brother, her own uncle, Acerbas, or as he is called by Virgil Sichæus, high-priest of Hercules, and a man of immense wealth. On the death of Mutgo, Pygmalion succeeded to the Tyrian throne. Envying the great possessions of his uncle Sichæus, he is said to have put him to death, and Dido immediately made preparations for leaving the country. In company with a few of the Tyrian nobles, who were discontented with the rule of Pygmalion, she left her native country, taking with her the treasures of her murdered husband. The fugitives first landed at the island of Cyprus, whence they carried off eighty virgins to furnish wives for the settlers in the new colony which they intended to found. Pursuing her voyage, Dido landed on the northern coast of Africa, where she purchased from the natives as much soil as she could cover with the hide of a bull. She cut the hide however into such thin stripes that she inclosed a large tract of country, on which she immediately began to build a city. As the city, which was named Carthage, rose from its foundations, the neighbouring chiefs viewed it with jealousy; and one of their number, Hiarbas, at length sent to demand the hand of Dido in marriage, threatening to make war on the infant state in the event of a refusal. Dido at first declined, and ultimately demanded three months to make the needful preparations. At the end of that period she caused a splendid funeral pyre to be erected in the city. Ascending this with a drawn sword in her hand, she stabbed herself in presence of all the people. The story of Dido as narrated by Virgil differs considerably from that which we have given. In the Æneid, Dido is represented as falling in love with the hero of that epic, and killing herself when she discovers that her passion is not reciprocated. The glaring anachronism involved in this version of the story has been frequently remarked.

DIDRACHMA, in *Antiquity*, a silver coin, equal to two Attic drachmæ, and also to the Jewish half shekel. It was equivalent to about 1s. 4d. of our money.

DIDYMUS, a celebrated grammarian of the Augustan age. He was the son of a seller of fish at Alexandria, and was born about B.C. 64. He was a disciple of Aristarchus, and in his literary labours he followed strictly the critical principles of his master. Athenæus computes the works of Didymus at 3500, and Seneca at 4000. The names of χαλκέντερος (brazen-bowelled), and βιβλιολάθας (forgetter of his own books), by which he was distinguished amongst his contemporaries, sufficiently indicate his perseverance, and the voluminous character of his writings. His principal works seem to have been his scholia on Homer, Aristophanes, Pindar, Sophocles, Euripides, and several of the Greek orators. It is probable that many of the comments of the later scholiasts were borrowed from him. He is said also to have written against Cicero's *Republic*. The collection of Greek proverbs, and the fragments of the books on agriculture, which bear his name, are at least only in part genuine.

DIDYMUS, of Alexandria, an ecclesiastical writer who flourished in the fourth century. Notwithstanding his blindness, which took place before he had learned to read, he succeeded in mastering the whole circle of the sciences then known; and on entering the service of the church he was placed at the head of the Alexandrian theological school. Most of his theological works are lost. We possess however a Latin translation by Jerome of his *Treatise on the Holy Ghost*, and a similar translation by Epiphanius of his *Brief Comments on the Canonical Epistles*. A *Treatise against the Manichæans* is extant in the original Greek, and was first published at Bologna in 1796.

DIDYNAMIA, in *Botany*, the fourteenth class in the Linnæan system, comprehending such plants as have four stamens.

DIE, a small cube used in gaming, as described under Dice. It is also used generally for any cubic body.

Die also denotes a stamp used in coining, in foundries, &c. Its plural form is *dies*. See Coinage.

Die (*Dea Vocontiorum*), a town of France, capital of an arrondissement of the same name, in the department of Drôme, and situated in a fertile valley on the right bank of the Drôme, 36 miles E.S.E. of Valence. It is surrounded by old walls flanked by towers, and was formerly the seat of a bishop and of a Calvinistic university. Manufactures—silks, paper, and leather. Pop. (1851) 3858.

Dié, St, a town of France, department of Vosges, and capital of a cognominal arrondissement. It is situated on the Meurthe, 24 miles E.N.E. of Epinal, and is surrounded by an old wall. It is the seat of a bishop, and has a communal college and public library. Manufactures—cottons, hosiery, and ironware. Pop. (1851) 8692.

There is also a small town of this name in the department of Loire-et-Cher on the left bank of the Loire, arrondissement, and eight miles N.E. of the town of Blois. Pop. about 1300.

DIEBURG, a town of Hesse-Darmstadt, province of Starkenburg, and capital of a bailiwick of the same name, is situated on the right bank of the Gersprenz, seven miles E.N.E. of Darmstadt. It is defended by a strong castle (formerly the residence of the Counts of Lerchenfeld), and has about 3200 inhabitants.

DIEMERBROEK, Isbrand van (1609-1674), a learned professor of physic and anatomy at Utrecht, was born at Montfort. He wrote a well-known treatise on the plague, and several works on subjects connected with anatomy and medicine.

DIEPPE, a seaport town of France, capital of an arrondissement of the same name, in the department of Seine-Inferieure, situated at the mouth of the Arques on the English Channel, 32 miles N. of Rouen, and 92 miles from Paris; in N. Lat. 49. 55. 34., E. Long. 1. 4. 44. Pop. (1851) 16,216. The town proper is separated from its suburb of Pollet by the port, but communicates with it by means of a flying bridge. It extends about a mile along the coast; and to the westward on a chalk cliff stands the castle, an edifice of the fifteenth century, commanding both the town and harbour. The port, inclosed by two jetties, is large and secure, and admits vessels of 600 tons. It is however dry at low water, and the entrance is narrow and rather dangerous. The town is well built, the streets are

wide and regular, and the houses mostly of brick, ornamented with balconies. It is well supplied with water by means of an aqueduct 3 miles in length; and has 68 public fountains, besides numerous private ones. The principal street runs parallel to the sea, from the harbour to the castle, and contains some fine shops and hotels. Dieppe is the seat of a court of original jurisdiction, and has a communal college, public library, navigation school, theatre, assembly rooms, and hospital. It is much resorted to in summer as a watering-place, and has a handsome bathing establishment. It is a place of a very extensive general trade, which has been much increased since the completion of the line of railway connecting it with Paris. Ship-building, and the herring and other fisheries are carried on; and there are manufactures of leather, lace, ivory articles, paper, &c. Dieppe has regular communication by steam-vessels between Brighton and Dieppe.

DIES MARCHIÆ was the day of congress or meeting of the English and Scotch, annually appointed to be held on the marches or borders, in order to adjust all differences between them.

DIESIS, in *Ancient Music*, the difference between a major and a minor semitone. In modern music it means the sign ♯, otherwise called a *sharp*, which, prefixed to a note, indicates that the note is to be raised a semitone.

DIESPITER, in *Antiquity*, a name given to Jupiter, as the father or lord of heaven. It is a contraction of *Diovispater;* or perhaps a protraction of *Dis*, an old Umbrian name for that god.

DIEST, a town of Belgium, province of South Brabant, and capital of a cognominal canton, is situated on the Demer, 28 miles E. by N. of Brussels. Pop. (1851) 8335. It has manufactures of woollens, hosiery, &c., and some extensive breweries. It was taken from the French by Marlborough in 1705, and retaken the same year.

DIET (Lat. *dies, day*), the name given to the principal national assembly in various countries of modern Europe. In Dutch it is called *ryksdag;* in German *reichstag;* in Swedish *riksdag*, and in Danish *rigsdag;* all which words prove the above mentioned derivation.

DIET, in *Law*, the day or time fixed for compearance in court.

DIETETICS.

THE necessity of aliment is explained by a knowledge of the functions of the body, and its selection depends upon the same principles. The living machine, as well as those that are inanimate, wastes in proportion as it is used, and this waste must be supplied. To learn the kind of supply required, the kind of waste and its mode must be ascertained.

General view of the subject. The human body is of a very compound nature; indeed it is the most compound of all bodies, as well as the most complicated of all machines. It is composed of solids and fluids, and these again consist of various chemical elements in different states of combination. A great part of the mass of our bodies consists of water, and certain animal substances, to which chemists have given the name of fibrin, albumen, gelatin, mucus, and osmazone. Our bones consist principally of phosphate of lime. Besides these, some other principles enter into the composition of our bodies, though in comparatively small proportion. All the elementary matters of which these principles consist are continually discharged by the various excretions, but generally in states of combination different from those in which they existed as a part of our body. By the lungs a great deal of carbon and hydrogen is exhaled in the form of carbonic acid gas and vapour; by the skin carbon and hydrogen are also thrown off in considerable quantity; by urine, in addition to carbon, hydrogen, and oxygen, much azote, phosphorus, and lime, are discharged in the form of urea and the phosphate of lime; and by the alvine evacuation, not only the indigestible parts of our aliment are expelled, but also carbon, hydrogen, and azote, which formed integrant parts of our bodies, and have fulfilled their functions in the form of bile, mucus, and intestinal flatus. We therefore see that there is a constant waste of carbon, azote, hydrogen, oxygen, phosphorus, and lime, going on, which must be replaced. But there are only two sources from which this waste can be repaired, the atmosphere in which we live, and the aliment which we introduce into our stomach The atmosphere consists of oxygen and azotic gases, and it is very doubtful whether any part of either be absorbed or converted into a part of our bodies. At least we may assume, that from the air no part of the materials to supply the waste of the body is derived. These must, therefore, be furnished entirely from the matters introduced into the stomach, and those which are calculated to restore any of the deficient elements or principles alone are alimentary. It is not at all necessary that these elements should be in the same state of combination with the principles whose loss they are to supply. It is sufficient that the elements be there, for it is the very essence of the function of digestion to analyse the alimentary matters, and reunite their elements into other combinations assimilated to our nature. From this view of the subject, it would however seem, that the more nearly the alimentary substances approach to the nature of the substances whose waste they are to supply, the less change upon them is necessary, and their digestion and assimilation will be more easy. Upon these principles, animal substances should be more easily digested than vegetable, and a larger proportion of their elements should be assimilated, while a smaller proportion should be separated to form excrementitious or indigestible compounds. In the same manner, vegetable substances are more digestible, and generate less excrementitious matter, than inorganic substances, which furnish only a small proportion of assimilable matter, and which must be separated from combinations totally foreign to our nature.

Besides alimentary substances properly so called, there is another class of substances which do not contribute much to repair the waste of our bodies, and yet perform an essential part in the function of digestion. These are called condiments, and their use is to stimulate the organs of digestion to greater activity; and, in fact, they are all much more sapid than the proper alimentary substances, which are in themselves generally insipid or mawkish.

From the view we have taken of aliments, it will appear that they are furnished by all the kingdoms of nature; the mineral kingdom supplying chiefly water and lime, while the vegetable, in addition to these in smaller quantity, yields much carbon and hydrogen; and the animal kingdom, in addition to a proportion of all the preceding elements, furnishes almost all the azote which enters into our composition. Although this statement be generally true, there are facts which at first do not seem to accord with it; and there are some grounds for believing that living bodies have either the power of changing the elementary nature of bodies, or of analysing these bodies we at present consider as simple, so that one is apparently changed into another. Thus some animals, in the state of nature, live only upon animal substances, and it is easy to conceive how, by a very simple process, the blood and flesh of their prey should become a part of their proper blood and flesh. Their elements, and even the combina-

tions of them, are alike. But there are other animals whose flesh and blood do not differ materially from those of carnivorous animals, and which live almost entirely upon vegetable substances far removed from animal nature, and containing little if any azote.

This subject has lately engaged the attention of Magendie,[1] the most distinguished Parisian physiologist of the present day; and his views are the most important lately promulgated upon this point, and throw very great light upon the subject of dietetics. To ascertain the sources from which animals derive the azote which enters into their bodies, he performed some experiments, which appear to prove that azote is an indispensable constituent in the food of animals. For the subjects of his experiments he chose dogs, because, like man, they can be supported by vegetable as well as animal food, and he confined them to the use of pure water, and substances totally devoid of azote. *Sugar,* perfectly pure, was first tried. Of this, and of distilled water, he allowed an unlimited quantity to a small dog, three years old. For the first seven or eight days it seemed to agree very well with this diet. It was lively, active, and eat and drank as usual. In the second week it began to fall off, although its appetite continued very good, and it eat from six to eight ounces of sugar in the course of twenty-four hours. Its alvine excretions were scarce and scanty, while that by urine was abundant. In the third week it became more emaciated, it lost its liveliness, and its appetite began to fail. During this period also its eyes became affected in a singular and very distressing manner. The emaciation increased every day, its strength failed, and although it continued to eat from three or four ounces of sugar daily, it became so weak that it could neither chew nor swallow, and of course could not move. It died on the thirty-second day of the experiment; and, on opening its body, there was a total absence of fat; the muscles were reduced to one sixth of their bulk, and the stomach and intestines were much contracted. The gall and urinary bladder were both filled with fluid; but on analysis, the bile and urine resembled those of herbivorous animals. The urine, instead of being acid, as in those which eat flesh, was like that of herbivorous animals, sensibly alkaline, and did not contain a trace of uric acid or the phosphates, while the bile contained the picromel so remarkable in ox gall. The excrements also contained much less azote than usual. This experiment was twice repeated, with nearly the same result.

Olive-oil was next tried with two healthy young dogs, which seemed to agree with them for the first fifteen days, but then produced the same bad effects, and both died on the thirty-first day.

Gum was given to several dogs, and always with the same result.

Butter, an animal substance, but which does not contain azote, was also tried; and although, after the thirty-second day, the dog was allowed as much meat as it could eat, it died on the thirty-sixth day, similarly affected.

M. Magendie also killed several dogs at a proper period, after they had got a full meal of oil, sugar, or gum, in order to observe the nature of the chyle thus furnished. The chyle of the oil was of a decided milky white, whilst those of the gum and sugar were transparent, opaline, and more watery. These experiments, in M. Magendie's opinion, render it doubtful whether the oils, fats, gum, and especially sugar, are so nutritive as is generally supposed. But before we adopt his conclusion, we must remember that whole nations subsist upon food which contains very little if any azote. The Hindus live almost entirely upon rice, the peasants of Lombardy upon maize, those of Ireland upon potatoes, the slaves in the West Indies get fat during the cane crop, and the negroes of Senegal during the gum harvest, and herbivorous animals are nourished at all times upon grass. M. Magendie is not ignorant of these facts, but tries to explain them away by doubting the accuracy of some of the relations, and alleging that few vegetables are altogether destitute of azote He cites, in confirmation of his observations, the experiments of Dr Stark, who injured himself by trying to live on sugar, bread, and water; and of M. Clouet, who grew extremely weak upon potatoes and water; and instances the insufficiency of sugar and a little rum to support the crew of a shipwrecked Hamburg vessel. The legitimate conclusions from all the facts relating to this subject seem to be,

1. That animals derive the azote which enters into their composition entirely from their food, and hence that no animal can live for a considerable time upon food totally destitute of azote.

2. That animals, even those naturally carnivorous, can live a certain time upon food entirely destitute of azote, in consequence of which the excretions of the naturally carnivorous become altered, and throw off less azote than when fed on animal food, acquiring the properties which these excretions have in animals whose food contains a very small proportion of azote.

3 That vegetable and animal substances destitute of azote are highly nutritious, provided, at the same time, azote be supplied from the admixture of some other aliment containing it, though in small proportion.

Upon these principles, alimentary substances may naturally and philosophically be divided into three great classes.

I. Those which contain azote, carbon, hydrogen, and oxygen.

II. Those which contain carbon, hydrogen, and oxygen

III. Those which contain neither azote nor carbon.

I. *Alimentary Principles which contain Azote, Carbon, Hydrogen, and Oxygen.*

The aliments which contain azote correspond with the animal substances in general, and are calculated to repair the waste of our solids and fluids, without great alteration or effort in the digesting organs. All the immediate principles of this class are not, however, equally digestible, or possessed of the same properties. We shall say a few words of each.

Fibrin constitutes the great mass of the solid matter of the muscles of animals; especially of those which are old and have dark-coloured dry flesh. It is also a principal constituent of the blood of all animals. There can be no doubt, therefore, that it is pre-eminently nutritious in these its natural forms of combination, but we know of no experiments to ascertain its nourishing powers when used alone. The purest form of fibrin which occurs in common circumstances is the fibre of flesh which has been long boiled in a great quantity of water, as in the remains of the meat from which beef-tea is made, or of that boiled down for soup. This is generally considered, and is often thrown away, as totally indigestible, and deprived of all its nourishing principles; but this is probably a vulgar error, for animal fibre in this state still contains, as much as ever, all the elementary substances which are necessary for animal food; and the only circumstance which can account for their indigestibility, is their great aggre-

[1] *Mémoire sur les propriétés nutritives des substances qui ne contiennent pas d'azote,* 8vo, Paris, 1816.

gation, which it is the business of cookery to overcome. Fibrin also forms a large proportion of the substance of some of the internal organs of animals, all of which are nutritious. Pure fibrin is white and opaque when moist, but acquires a dark colour on being dried. It does not become putrid when kept in the air, nor even when immersed in water for a considerable length of time. It contracts and shrinks on the application of heat, and gives out, on being burnt, the smell of burning horn or feathers. It is insoluble in cold water; is corrugated by boiling in water; is insoluble in alcohol; but strong acetic acid swells it considerably, and renders it transparent like cartilage, in which state it may be dissolved, or, at least, diffused through water by long boiling.

Fibrin varies in every species of animal, and in the same animal at different ages, either from a difference in its nature, or from a difference in the matter with which it is combined. In many fishes, and the lower classes of animals in general, it is semitransparent and colourless. In veal, pork, salmon, chicken, and some other kinds of poultry, it has a pink colour; in beef and mutton it is of a fuller red; and in pigeon and game, both birds and quadrupeds, it is dark coloured. In general it is more tender in the female than in the male, and in the young animal than in the old.

Albumen is also a principal constituent of animal substances, in which it exists in two states, one uncoagulated and the other coagulated. Of the former, the purest example occurs in the raw white of eggs. Cartilage, horn, hair, nails, consist chiefly of the latter. It is also a principal constituent of blood and brain; and it seems to be the chief substance of oysters, mussels, and snails. Uncoagulated albumen is sometimes solid, often glairy, always transparent, and, when fluid, is soluble in water, and its taste is bland or almost insipid. At 165° Fahrenheit it is converted into a white solid mass, of which we have a familiar example in the white of a hard-boiled egg. There can be no doubt that albumen, especially in its uncoagulated state, is highly nutritious and easily digestible.

The curd of milk may be considered as a variety of albumen, although it possesses some peculiar properties, especially that of being converted into cheese by a particular mode of management.

Gelatin is a third very principal constituent of animal solids, as bones, ligaments, tendons, membranes, skin, muscles, &c. and exists in much larger proportions in the flesh of young than of adult animals. Thus we see the gravy of veal and lamb always gelatinize, while that of beef and mutton does not. The swimming bladder of the several species of sturgeon is gelatin in a state of very great purity, and by boiling it may be extracted pure from the shavings of hartshorn. Its taste is bland and nearly insipid. It is characterized by its solubility in water, being much increased by a boiling temperature, and by the solution, when of a certain strength, gelatinizing or cooling. It is highly nutritious, and supposed to be the most easily digestible of animal matters.

Mucus differs from albumen chiefly in not being coagulated by heat or corrosive sublimate, and from gelatin in not being precipitated by vegetable astringents, nor gelatinizing when its solution is concentrated. It exists nearly pure in saliva, and is a constituent of most of the secretions. There can be no doubt of its easy digestion and nutritious quality.

Of these four principal constituents of animal matter we may remark, that in themselves they are almost insipid; that gelatin exists almost entirely in a solid form, more or less dense; that mucus and albumen exist in every form of aggregation, from perfect fluidity to the density of cartilage; and that fibrin is only fluid in the living blood, but in every other instance is a tough solid: and that gelatin is very soluble in boiling water, and gelatinizes on cooling; that albumen in soluble in cold water, and coagulates at 165°; and that fibrin is not soluble either in cold or hot water. We may also remark that, although chemists have given very definite characters of each, as if they constituted absolutely distinct species of matter, these characters are taken from certain selected kinds of each, and that, in reality, we find that there is a regular and insensible gradation from mucus, through gelatin and albumen, to fibrin; and that, as in the process of animalization, as well as in the progress of life, they pass into each other, and many intermediate states are found which cannot be distinctly referred to any of them.

Osmazome, or animal extractive, differs very much from the preceding principles; chemically, in being soluble in alcohol, and to the senses, in being very savoury or sapid. It is upon this, which seems to admit of considerable varieties, that the flavour of animal food, and of each of its kinds, depends. It exists chiefly in the fibrous organs, or combined with fibrin in the muscles, while the tendons and other gelatinous organs seem to be destitute of it. The flesh of game and old animals also probably contain it in greater quantity than that of young animals abounding in gelatin.

Gluten is the only vegetable substance which contains a notable proportion of azote in its composition. When separated from other principles, it forms a tough, ductile, elastic, and tenacious mass of a gray colour, resembling, when drawn out, thin animal membrane; when dried it is brittle, hard, and slightly transparent, like glue. When kept moist it ferments and acquires some of the properties of cheese. Immersed in water it at last putrefies. When burnt or distilled it resembles in its properties horn or feathers. It is soluble in concentrated acetic acid, and, by the assistance of heat, in muriatic acid and in the alkalies. It then bears a strong analogy to the animal substances in general, resembling, by different properties, fibrin, albumen, and gelatin. It is very generally found, though only in a small proportion, in the vegetable kingdom, in all the farinaceous seeds, in the leaves of cabbages, cresses, &c.; in some fruits, flowers, and roots, and in the green feculum of vegetables in general; but it is particularly abundant in wheat, and imparts to wheat-flour the property of fermenting and making bread. On the nutritious powers of gluten separated from other principles nothing certain is known; but the superior nutritious powers of wheat-flour over that of all other farinaceous substances sufficiently proves that, in combination with starch, it is highly nutritive; and in all probability it is the gluten of the green feculum which supplies the azote necessary for the support of the herbivorous animals.

II. *Alimentary Principles which contain Carbon, Hydrogen, and Oxygen.*

Starch is very abundantly diffused through the vegetable kingdom. It exists in great purity in various farinaceous grains, such as rice, barley, maize, and millet; it is combined with gluten in wheat; with saccharine matter in some grains, as oats, and in many leguminous seeds, such as haricot-beans, lentils, vetches, and peas; with viscous mucilage, in rye, potatoes, and Windsor beans, with fixed oil and mucilage in the emulsive seeds, such as nuts, almonds, cocoa, tamarinds, in linseed, rapeseed, hempseed, poppyseed, and, in general, all those from which an oil can be obtained by expression. Lastly, starch is sometimes united to a poisonous substance. Of this singular union of a nutritious with an injurious principle the most remarkable instance occurs in the roots of the Ja-

tropha manihot, and of many species of arum, to the former of which the negro slaves of the West Indies are indebted for their cassada bread, and from the latter is prepared the best arrow-root starch. Only one species of grain, the *Lolium temulentum*, is hurtful; but many leguminous seeds are poisonous, of which the most familiar example occurs in the laburnum peas.

Starch is artificially prepared in great purity from various substances. *Starch* is got from wheat and potatoes, *arrow-root* from various species of arum, *cassada-flour* from the manioc root, *salep* from the orchideæ in general, *sago* from the pith of various species of palm-trees, *tapioca* from the bitter and sweet cassava root. In all of these varieties of form, starch furnishes a bland and wholesome nutriment.

Gum or *Mucilage* is also a principal ingredient in the composition of our alimentary vegetables. The distinctive character of gum is its solubility in cold as well as hot water, and its insolubility in alcohol. It is devoid of smell, and to the taste it is bland and agreeable. In Arabia, Senegal, and the East Indies, it is obtained in great quantities from the various species of *Mimosa*, from the bark of which it exudes in great purity; and in hot climates in general it is furnished by many trees, especially those which have an astringent bark. In our own country an example of its production is seen on the bark of the plum and cherry trees. Where it is produced in sufficient quantity it constitutes a principal article of diet; and the Africans of Senegal are said to live entirely upon it during the gum harvest. Eight ounces of gum are the daily allowance, and furnish sufficient nourishment, for each man.

Mucilage is the alimentary principle of many of our esculent vegetables. In some it is united only to green colouring matter, as in the leaves of beet and spinach; with bitter matter, which may be prevented by the process of blanching, as in endive, lettuce, succory, and cardoon, or by using the plant very young, as in asparagus. It exists also in every part of the mallow tribe; in many roots, as scorzonera, salsafy, and Jerusalem artichokes, in the receptacle of the flower of the artichoke. It is combined with an acid in sorrel leaves; with saccharine matter in many fruits, as the fig and date; in roots, as the carrot, parsnip, and beet; and with slight acrimony in the turnip, cabbage leaves, cauliflower, and broccoli, and with considerable acrimony in the radish, cress, and mustard. It exists in great quantity, combined with a peculiar nauseous principle, in onions, garlic, shalot, leek, &c.; and, lastly, in small quantity, with much aroma, in those vegetables which are used only for seasoning, as parsley, thyme, &c. In short, it is very generally found throughout the vegetable kingdom, and in every mode of union with other principles.

Sugar, the common properties of which, in a state approaching to purity, are familiar, is also highly nutritious. It is crystallizable, soluble in water both cold and hot, in alcohol and the weak acids, readily undergoing, when dissolved in sufficient water, the vinous and acetous fermentation, but, on the other hand, when concentrated, preserving vegetable substances. Chemically considered, it presents many varieties. It exists in greatest quantity, combined with mucilage, in the juice of the sugar cane, of the maple tree, the manna ash tree, and of beet-root. It seems to be a constant attendant upon the inflorescence of vegetables, for almost every flower furnishes honey to the bee, and is a chief constituent of all the acerb, subacid, and sweet fruits, in combination with vegetable jelly. Sugar is produced, or at least collected, by several insects. To the bee we are indebted for honey; and a species of locust in New Holland covers the trees and ground with a kind of sugar. In all animals a principle having some analogy with sugar exists in the bile, and it is a product of morbid action in the disease called diabetes.

Oil and fat are also nutritious. They differ most obviously in fluidity, and they coincide in being insoluble in water, and in containing a larger proportion of hydrogen than the alimentary matters already spoken of. The oils may be divided into the fluid and concrete, and both are furnished by the vegetable and animal kingdoms. Fluid oil exists in quantity in the emulsive seeds; in some of them combined with prussic acid, as in the bitter almond, and in others with an acrid matter, as in the seeds of the ricinus; but it is obtained in greatest quantity and purity from the olive. The animal fluid oils are all more or less nauseous, as spermaceti oil, seal oil, whale oil, and cod liver oil. The concrete oils are generally furnished by the animal kingdom, and these are often bland and agreeable when fresh, but are apt to become rancid in proportion as they are less solid. Butter is the least consistent, if we except the fat of some birds; then hog's lard, the subcutaneous fat of beef, and the kidney fat of beef and mutton in succession. The only concrete oil obtained from the vegetable kingdom is the butter of cocoa.

III. *Alimentary Principles which do not contain Carbon.*

Water is perhaps the only real alimentary substance which belongs to this class, but it is one of the most essential. It is not only necessary to replace the constant waste of water which is drained off from our bodies, by the secretions, the cuticular discharge, and the vapour of the breath, but it is in itself strictly digestible, and capable of supplying either hydrogen or oxygen to the system, as may be required, according to the nature of our other food. When we consider how large a proportion of the whole weight of our bodies consists of water only, and that the fluids require more frequent renewal than the solids, the necessity of water as an aliment cannot be disputed. Some animals, as the rabbit, are supposed to be capable of living a long time or altogether without water; but this is a mere deception, for their vegetable food consists almost entirely of water. On the other hand, Dr Fordyce kept gold fishes six months in distilled water, and thought himself warranted in concluding that animals could live in water and air alone. Pouteau allowed some of his patients nothing but water for several weeks, without their falling off; and the histories of shipwrecked mariners prove with how small a portion of solid food man can subsist, provided he has sufficient allowance of water, whilst without water, or a substitute, no quantity of solid food can support man for even a few days.

Earths are, perhaps, not altogether unalimentary. Not to mention the depraved appetite of many young females, and of the dirt-eating negroes of the West Indies, for chalk, cinders, and such substances, earth is sought after and devoured by whole nations. The luxurious Capuans paid a considerable tribute to the Neapolitans for an earth called *Leucogæum*, which they considered necessary for the preparation of a favourite dish, *Alica*. The Tungusses, according to Laxmann, eat a fine clay with rein-deer's milk. Chandler saw the women and children in Samos chewing pieces of steatite as a luxury. La Billardière saw the same practised in New Caledonia, and found edible earth sold in the market in several villages in Java. Throughout all India lime is used along with the betel leaf. Kepler partook of the butter earth, which is eaten with great relish, spread upon bread, by the millstone quarriers of Thuringia; and, lastly, Humboldt has made us acquainted with the existence of a whole nation of earth-eaters, the Ottomacs on the Orinoco.[1] We may

[1] Tableaux de la Nature. Par A. Humboldt, 2 tomes 12mo, Paris, 1808.

Dietetics.

also mention that bird-fanciers find it necessary to supply birds shut up in cages with sand and earth. All these facts, we are aware, might be explained upon principles different from the digestibility of the earthy substances taken into the stomach; and we have no idea that any earthy substances can supply carbon or azote to the system; but we have absolute proof that earthy matter may enter into the circulation, in the growth and absorption of the bony frame of our body, for which phosphate of lime is as necessary as carbon or azote for our soft solids.

Sea Salt is more obviously necessary than earth. Even in insular and maritime situations it is voluntarily used as a condiment by all; but it is only in inland countries, at a distance from the sea, that its necessity is duly appreciated. Muriate of soda enters into the composition of all our fluids, and is thrown off by many of our secretions; hence its waste must be supplied, and where the vegetables are not naturally impregnated with it, it becomes one of the most indispensable articles of our food.

Alimentary substances, as presented to us by nature or prepared by art, may be considered in various points of view.

Digestibility of various alimentary substances.

They differ in regard to digestibility, or the facility with which they are decomposed by the powers of the stomach, to enter into new combinations fitted to repair the waste of the blood. In this particular, also, they may differ in respect to the length of time, or in regard to the digestive power of the stomach, required for their digestion. Thus the digestion of one substance may be slow, though ultimately complete, even in a weak stomach, and that of another quick enough in a strong stomach, although imperfectly digested by one that is weak. In reference to their digestibility, aliments are commonly described as being light or heavy; but in this respect there is very great difference in regard to different individuals, the same substances being light to one and heavy to another, and *vice versa.*

Sir Astley Cooper made some experiments to ascertain the comparative digestibility of different kinds of raw meat without fat; and the following table exhibits the loss 100 parts of each sustained in the stomach of dogs, which were killed, one, two, three, and four hours after being fed.

Pork	10	20	98	100
Mutton	9	46	87	94
Beef	0	34	37	75
Veal	4	31	46	69

In another experiment, after four hours, the digestibility appeared in the following order,—cheese, mutton, pork, veal, beef. Fat appeared to be also much more digestible than cheese; beef than potato, and codfish than beef. Boiled veal was much more digestible than roast; and of different parts of the same kind of food, the digestibility was in the following order,—fat, muscles, skin, cartilage, tendon, and bone.[1] From the experiments detailed in the inaugural dissertation of Dr Macdonald, *De Ciborum Concoctione*, Edinburgh, 1818, which were made in company with the late Dr Gordon, there appears to be great irregularity in the time necessary for the completion of digestion, so that they scarcely furnish any conclusion as to the comparative digestibility of different substances. Dr Macdonald infers that, of those he tried, butter was the most, and rice the least, digestible in the stomach of the dog. In the experiments which Dr Stark made upon himself, to ascertain the nutritious properties of oily substances, he found that, with a daily allowance of thirty ounces of bread and three pounds of water, two ounces of olive oil taken at one meal was so large a quantity as to be disagreeable; three ounces in the day caused some uneasiness in his bowels; and four ounces griped him very much, although he gained weight; but this experiment was not conclusive, as at that time he was suffering under sloughing gums, the effects of a protracted diet of sugar. A diet of four ounces of pure fat, obtained from the subcutaneous fat of beef, made into a pudding, with twenty ounces of flour, and twelve or twenty ounces of water, with the remainder of three pounds of water in drink, was both nourishing and agreeable; but when the fat was increased to six ounces, great part of it passed unassimilated, and his bowels were affected. The same pudding without the suet was not sufficiently nutritious, and did not satisfy his appetite in the same manner. When the pudding was made with butter, although only four ounces were used, he was made very ill by it. Oil of butter agreed very well; and oil of marrow, of all the fats Dr Stark tried, he found to be the mildest in the bowels. His gums having again become purple and swelled, with petechial appearances on his body, while making these experiments, suggested to him the following queries, which seem important to the science of dietetics. "Although at present I take more food than what is absolutely necessary for the support of the body, I remain perfectly well, whereas I have several times suffered considerable inconvenience from committing any excess in the quantity of oils. Is it not evident that excess in the quantity of oils is more hurtful to the body than excess in any other article of food? and that, of course, we ought to be particularly careful in regulating the quantity and quality of the oils we may employ in diet? Is it not probable, then, that animal oils, though they nourish and increase the weight of the body, are not of themselves sufficient to prevent a morbid alteration from taking place in the blood and fluids? whilst, on the other hand, the lean of meat, though less nutritious, is of more efficacy in preserving the fluids of the body in a sound state."[2]

Difference of aliments in respect of nutrition, taste, &c.

Aliments also differ in regard to the proportional quantity of nourishment they furnish, and, in this point of view, they are said to be strong and weak, or rich and poor. This difference may arise either from the proportional quantity of digestible and indigestible parts in the various kinds of aliment, or from the digestible parts being different in kind, and furnishing a supply of a different kind to the blood. There is even in this respect some opposition between light food and strong food, and it may be generally observed, that food which is most quickly digested, requires the soonest to be repeated, while digestible food, that is only slowly digested, supports the body for a greater length of time.

Aliments also differ in the impression they make on our palate; and it is chiefly in this respect that they are considered by the epicure. This impression proceeds from two distinct qualities in the aliment; the one depending upon their grosser physical properties, and the other upon their finer, recognizable only by the senses of taste and smell. To the former class belong the sensations of solid and fluid, hard and soft, tough and tender, crisp and stringy, hot and cold, greasy, glutinous, gritty, smooth, &c. These are judged of by the tongue and palate, rather

as organs of touch than of taste, and are altogether independent of flavour, as capable of affecting the organs of taste and smell. The latter class consists of all the variety of tastes properly so called, namely, sweet, bitter, sour, salt, alkaline, astringent, aromatic, nauseous, pungent, acrid, spirituous, cooling, &c., and also the want of taste, the vapid or mawkish. Of these, some are almost universally agreeable, and others generally disliked, but much depends upon idiosyncracy, state of health, education, habit of the individual, and upon the degree or quantity of flavour.

Aliments also differ in the impression made upon the stomach; but the sensations arising from this source are more obscure and less varied. Except the sensation of heat, which may arise from caloric, and is transient, or from acrimony or spirit, which is more durable, most of the sensations experienced in the stomach are indications of its mechanical state, or of affections of the appetite. Hence we have the feeling of gratification, from removal of a sense of emptiness, of repletion, distension, cessation of hunger or thirst, satiety, and sickness.

General observations on diet.

We should also consider the effect of different kinds of diet, when the body is in a state of health, and different states of disease; but accurate experiments are still wanting to enable us to give any thing more than fragments of this interesting subject. It is extremely difficult to institute these experiments satisfactorily. They are irksome to the person on whom they are tried; and so many causes tend to interfere with the results, that it is only by frequent repetition that the real effects can be fairly deduced.

Our diet may be either proper, or it may err, and this either in quantity or quality. When the quantity is too small, the body is not nourished; it becomes lean, the fat disappears, and the muscles either get soft and flabby, or shrivelled and dried up, accompanied by loss of strength or stiffness, with predisposition to an actual disease. Errors in regard to the quantity of food are merely relative; so much depends upon circumstances, as individuality of constitution, period of life, state of health, degree of mental and corporeal exertion, habit and temperature. Each person may be said to have a different standard quantity, deviations from which are to be accounted errors. In our army, the rations allowed for each soldier at home are, three quarters of a pound of meat, boiled so as to afford broth, with 1½d. worth of potatoes and other vegetables, one pound of bread, or one and one eighth pound of oatmeal; and in most cases one pound of milk or coffee is purchased for his breakfast. On service the rations are, one pound of meat, one and a half pound of bread, and one pint of wine or one sixth of a pint of spirits.

Mr Buxton states that the diet allowed to the prisoners in the jails in London varies from fourteen ounces of bread per day, and two pounds of meat per week, which, he says, is not enough to support life, up to one pound and a half of bread, one pound of potatoes, two pints of hot gruel, and either six ounces of boiled meat, without bone, and after boiling, or a quart of strong broth, mixed with vegetables, per day, which is as much more than enough; and Mr Buxton thinks that the meat should be discontinued. A fit prison diet, in his opinion, should consist of one pound and a half of bread, at least one day old, to each prisoner, daily, and one pint of good gruel for breakfast; and, upon good behaviour, half a pound of meat on Sundays.[1]

Some experiments have been made in order to ascertain the quantity of different kinds of food necessary for the sustenance of individuals. Dr Franklin, when a journeyman printer, lived a fortnight on bread and water, at the rate of ten pounds of bread a week. Dr Stark, whose weight was 171 pounds avoirdupois, found that thirty-eight ounces of bread daily were not more than sufficient to satisfy his appetite; forty-eight ounces were the utmost he could consume in one day, and the greatest quantity he could take at one meal, without uneasiness, was thirty ounces; and, with this diet, he required necessarily three pounds of water for drink, for with only two pounds he was not satisfied. In another experiment, thirty ounces of bread and three pounds of water, with six ounces of boiled beef, sufficed: with four ounces of the beef his appetite was not satisfied; with two pounds of bread and three pounds of infusion of tea, he found that one pound of cold stewed beef was not more than sufficient: he was not satisfied with four ounces of beef to breakfast; but eight ounces at dinner, and four ounces at supper, were rather too much.

Absolute starvation produces diminished excretions, fetid breath, foul skin, and death. The most distressing histories of this dreadful end are recorded in the account of shipwrecks, and of those unfortunate persons who fall into the hands of the Arabs of the desert. Man can sustain the absolute want of food for several days, more or fewer in number according to circumstances; the old better than the young, and the fat, probably, better than the lean. The total want of drink can be borne only a very short time, and its effects are even more distressing than those of want of food. They have been strikingly described by Mungo Park and by Ali Bey, as experienced in their own persons. The narratives of shipwrecked mariners also prove with how very little food life may be supported for a considerable length of time; and the history of those impostors who pretend to live altogether without food or drink display this adaptation of the wants of the body to its means of supply in a still more striking manner; for, even after the deception in such cases as that of Ann Moore is exposed, it will be found that the quantity of aliment actually taken was incredibly small.[2]

Captain Woodard has added to his interesting narrative many instances of the power of the human body to resist the effects of severe abstinence.[3] He himself and his five companions rowed their boat for seven days without any sustenance but a bottle of brandy, and then wandered about the shores of Celebes six more without any other food than a little water and a few berries. Robert Scotney lived seventy-five days alone in a boat, with three pounds and a half of meat, three pounds of flour, two hogsheads of water, some whale oil, and a small quantity of salt. He also used an amazing quantity of tobacco. Six soldiers deserted from St Helena in a boat on the 10th of June 1799, with twenty-five pounds of bread and about thirteen gallons of water. On the 18th they reduced their allowance to one ounce of bread and two mouthfuls of water, on which they subsisted till the 26th, when their store was expended. Captain Inglefield and eleven others, after five days of scanty diet, were obliged to restrict it to a biscuit divided into twelve morsels for breakfast, and the same for dinner, with an ounce or two of water daily. In ten days, a very stout man died, having

become unable to swallow, and delirious. Lieutenant Bligh and his crew lived forty-two days upon five days' provisions.

In the tenth volume of Hufeland's *Journal*, M. Gerlach, a surgeon-major of the Prussian army, has related a very remarkable and well authenticated case of voluntary starvation. A recruit, to avoid serving, had cut off the fore-finger of his right hand. When in hospital for the cure of the wound, dreading the punishment which awaited him, he resolved to starve himself, and on the 2d of August began obstinately to refuse all food or drink, and persisted in this resolution till the 24th August. During these twenty-two days he had absolutely taken neither food, drink, nor medicine, and had no evacuation from his bowels. He had now become very much emaciated, his belly was somewhat distended, he had violent pain in his loins, his thirst was excessive, and his febrile heat burning. His behaviour had also become timid. Having been promised his discharge unpunished, he was now prevailed upon to take some sustenance, but could not at first bear even weak soup and lukewarm drinks. Under proper treatment he continued to mend for eight days, and his strength was returning, when, on the 1st of September, he again refused food, and assumed a wild look. He took a little barley water every four or five days to the 8th; from that day to the 11th he took a little biscuit with wine; but again, from the 11th September to the 9th October, a period of twenty-eight days, he neither took food, drink, nor had any natural evacuation. From the 9th to the 11th he again took a little nourishment, and began to recruit; but, on the 11th, he finally renewed his resolution to starve himself, and persevered until his death, which took place on the 21st November, after a total abstinence of forty-two days.

On the other hand, the quantity of nourishment which can be devoured with impunity is often very great. Almost every person in good circumstances eats more than is necessary for supporting his body in a state of health, and many bring their stomachs to require a very excessive allowance as almost necessary. In some individuals an inordinate appetite seems constitutional. Charles Domery, aged twenty-one, six feet three inches high, and well made, but thin, when a prisoner of war at Liverpool, consumed in one day four pounds of cow's udder and ten pounds of beef, both raw, together with two pounds of tallow candles and five bottles of porter, and, although allowed the daily rations of ten men, he was not satisfied.[1] Baron Percy has recorded a still more extraordinary instance in a soldier of the name of Tarare, who, at the age of seventeen, being of moderate size, rather thin, and weighing only a hundred and seventy pounds, could devour, in the course of twenty-four hours, a leg of beef twenty-four pounds in weight, and thought nothing of swallowing the dinner prepared for fifteen German boors.[2] But these men were remarkable, not only for the quantity they consumed, but also for its quality, giving a preference to raw meat, and even living flesh and blood. Domery in one year eat 174 cats, dead and alive; and Tarare was strongly suspected of having devoured an infant, which disappeared mysteriously. Many other histories of the same kind are preserved; and although some of the individuals were men of large stature and great strength, others were of ordinary size. The excess of food may be taken either in the form of too much at one meal or of too many meals. It is either digested and furnishes an excess of nourishment, or it passes through the canal simply indigested, or it undergoes the fermentation natural to it. An excess of nourishment either produces a great or rapid increase of the size of body generally, or of the fat and abdominal viscera in particular, or, by inducing great fulness of blood, produces diseases which sometimes counteract the effects of the plethora. When the excess passes simply indigested, it only occasionally proves hurtful as a mechanical irritation in the bowels, especially when it is of a hard substance, and has sharp angles. When it undergoes its natural fermentation this is either acid or putrid, as the substance is vegetable or animal, or rather as it is destitute of or contains a notable proportion of azote.

When diet errs in quality, it gives rise to a greater variety of cases. It may either produce a directly hurtful effect upon the constitution, in the manner of a poison or medicine, in its natural state, or after fermenting in the stomach; or it may prove injurious more indirectly by not supplying an element necessary for its healthy condition, or by supplying one in excessive proportion. The poisonous effects of alimentary substances are always occasional, and arise from a peculiarity in the aliment itself, as in the case of poisonous fishes, or in the individual, as in those persons who cannot eat particular kinds of food, which are to others wholesome and nutritious. The unpleasant effects of substances undergoing their natural fermentation in the stomach are much more frequently observed. They occur either from a very strong disposition in the food to ferment, so that the action of a healthy stomach is not able to restrain it, or from excess of the food, so that part of it is left to its natural changes, or from weakness of the stomach, which exerts little action upon it. Fermenting substances are hurtful, by acting as direct poisons, and by distending the stomach; in the non-azotized substances becoming acid and producing flatulencies, in the azotized substances becoming putrid and producing fetid eructations and flatus. Diet, which errs by supplying one of the elementary constituents of our body in excess, or in not supplying another, does not produce its full effects at once, but gradually changes the condition of the body. When an elementary principle is furnished in excess, it is thrown off by the various excretions, and hence we find that the urine of omnivorous animals, when confined to animal food, contains more urea, and their perspirations and stools are more fetid; while the urea disappears, and the stools and perspirations lose their fetor, when they are restricted to vegetables. The same observations have been made in regard to man. Also, when the supply of an elementary principle is deficient, it ceases to be thrown off by excretion, even after it has performed its functions in the body, but is re-absorbed, and thus the body, for a time, lives as it were upon itself.

The chief varieties of diet, in regard to quality, depend upon their immediate effects, and in this respect they may be divided into the simply nutritious and the stimulant. All animal flesh seems to be more or less stimulant, and, in general, the more so the darker its colour is; and upon this principle chiefly has Dr Darwin founded his classification of aliments, but he has erred in considering them as also more nutritious. Moor-game, pigeon, hare, and venison, are more stimulating, but perhaps not more nutritious, than the turkey or barn-door fowl, veal, or lamb. The effect upon the composition of our bodies is the secondary but most important effect. In this respect, food

[1] Account of a Man who lives upon large quantities of Raw Flesh, by Dr Johnston; in the Medical and Physical Journal, by Drs Bradley, Beatty, and Nohden, vol. iii. 8vo, London, 1800.

[2] Mémoire sur la Polyphagie. See Journal de Médécine, Chirurgie, et Pharmacie, par MM. Corvisart, Leroux, et Boyer, tome ix. 8vo, Paris, An. xiii.

might be divided into the azotized, hydrogenous, carbonaceous, and oxygenous, or rather into those which supply abundantly azote, hydrogen, carbon, and oxygen. This view is, however, chiefly theoretical, as we are very far from possessing facts enough to establish it completely, or to overturn it; but yet there are some which favour it. We have already noticed Magendie's experiments on substances which do not contain azote, from which he inferred that a certain supply of it was absolutely necessary to the support of animal life. Other facts lead to the same conclusion, especially the effect of restriction to one kind of aliment in the generation and cure of disease.

It is many years since Dr Rollo[1] was led, by the singular sweetness of diabetic urine, to conclude that, if he deprived the patient of all food which contained sugar, or the principles of sugar, he should be able to cure this hitherto untractable disease. He accordingly restricted his patients to the use of animal food, especially fat, and absolutely prohibited all vegetables, even bread, and all fermented liquors. The effects were very striking, and some patients were believed to be cured; at least the nature of their urine was completely altered from a morbid to a healthy state. As conducted by others, the same regimen has produced the same effects; but it is so disagreeable to the patients that they can seldom be prevailed upon to adhere to it, and unfortunately, notwithstanding the temporary removal of this prominent symptom, the disease generally continues its fatal course. We may, however, notice, that Rollo and others were guided in their choice of regimen by the principle of withholding the elements of sugar, and hence fat formed a chief part of it, and was a principal cause of the disgust it excited; but perhaps it would be better to select a highly azotized diet, in which point of view the muscular parts of dark-fleshed animals, such as game and old mutton, and those kinds of fish, such as skate, which contain much azote in a loose state of combination, should be selected; while wheaten bread, the want of which is so distressing to many, might be allowed, and fat, which contains no azote, should not be prescribed.

Magendie[2] ascribes the gravel to the superabundance of azote in our food, as the uric acid of which gravel consists is a highly azotized substance, and seems to be produced as a means of throwing off the excessive azote; and among the various causes with which gravel is connected, the most active in its agency is high living, or the use of animal food in excess. A Hanseatic citizen, who kept a good table previous to 1814, was afflicted with the gravel. He emigrated and lived very miserably in England, but his gravel completely left him. He re-established his affairs, and with his fortune his gravel returned. Again he was ruined, and went to France almost destitute, and his gravel disappeared. By industry he finally acquired a competency, and with it his old complaint, for which he then consulted Magendie. A Parisian lady of sixty, subject to gravel, read in a journal a short notice of Magendie's experiments, in which it was said that he had discovered in sugar a cure for the gravel. Without more advice she set about eating sugar, often to the extent of a pound daily, and in effect she removed the gravel, but disordered her stomach so much that she was obliged to resume her usual food, and with it the gravel returned.

The chemical theory of the scurvy is, that it is owing to the want of oxygenous food; and it cannot be denied that this theory has been very ingeniously supported by Dr Trotter, Dr Beddoes, and others. The rapidity with which those afflicted with it recover by the use of recent vegetables, especially the fresh citric acid, shows that it proceeds from an error in diet, but whether from a deficiency of nourishment in general, or from a deficiency of oxygenous aliment, is not quite so clear. When we compare the accounts of the ravages formerly committed by this dreadful disease, even during short voyages, with the almost total immunity which the British fleet has enjoyed since the time of Captain Cook, we have the strongest possible proof of the influence of diet upon the human frame, either as inducing or preventing disease.[3]

Hydrogenous food, such as the excessive indulgence in fat meat, butter, and oil, and still more especially in spirituous liquors, produces a change in the chemical constitution of our bodies, independently of the exhaustion of excitability by excess of stimulus. Bilious diseases, and a tendency to unwholesome fatness, are its most common effects; and it is only in the excessive hydrogenation of the system that we can find a rational explanation of that very singular phenomenon called the spontaneous combustion of the body; for even admitting that the clothes are accidentally set on fire in these cases, there appears no reason to doubt that the combustion is continued by the burning of the body itself. Now the greatest number of instances have occurred in old women addicted to the abuse of ardent spirits.[4]

The effects of oxygenous food, in imparting oxygen to the body, are not so well ascertained. Acids, and the subacid fruits, quench thirst, and are supposed to reduce animal heat; but their more obvious action is to affect the bowels and induce diarrhœa, and ultimately to render the body spare and thin. The new chemical pathology led to the exhibition of nitric acid for the cure of syphilis, as mercury was supposed to act by oxygenizing the system; and this acid has since been much employed also, from analogy, in the liver complaint. That the acid has excellent effects as a tonic, seems to be perfectly ascertained. It does not act upon the bowels like the vegetable acids, but there is no proof of its decomposition in the stomach, or of its imparting oxygen to the body. The oxygenizing of the system by means of the nitro-muriatic or oxymuriatic bath, now so fashionable in London, is a mere chimera. Pulmonary consumption was also, at one time, considered as a disease proceeding from superabundant oxygen, and the florid colour of the cheeks was adduced in proof of it.

No observations have yet been made on the effects of aliments containing an unusually large proportion of carbon, nor has any disease been ascribed to the carbonization of the system.

Peculiar species of regimen called *Training*.

It would extend this article much beyond the space we can allot to it, if we were even hastily to sketch the varieties of diet recommended in disease, and to explain their action; but it will not be superfluous to enter a little into the detail of that kind of regimen which has been found by experience to bring animals and man to the highest possible state of health, at least as measured by

Dietetics.

the amount of their physical force, and their power of continuing its exertions. It is to bring animals to this state that constitutes the business of *trainers*, as they are called. Cocks, greyhounds, race-horses, and men, are much more active and vigorous after being trained than in their ordinary condition. They are, in fact, in a higher state of health; and we are fully convinced that, by training, many diseases might be removed, and by living according to the same principles, general ill health might be commonly prevented. The public is very much indebted to Sir John Sinclair for having taken the pains to collect the fullest information on this subject.[1] He was assisted in his inquiries, we have reason to believe, by Mr John Bell, whose attention was directed to the subject by having the professional care of Captain Barclay during his great walking-match. From the answers procured to Mr Bell's inquiries, it appears that the whole secrets of training reduce themselves to principles which every man may practise, and ought to practise, as far as is consistent with his business and other duties; and, in particular, we think that they ought to be studied, thoroughly understood, and enforced, by all those to whom, in consequence of accidental circumstances, the care of the health and lives of many individuals are intrusted. We allude chiefly to military and naval officers, and the proprietors of large manufactories. In the British navy the importance of this subject has been long appreciated; and the comparative state of health of our fleets, in recent times, is as honourable to our naval commanders as the laurels of victory which encircle their brows. Soldiers are left more to themselves, and their officers have neither the same control nor responsibility; but we think that more might be done in keeping the troops, as well as the military horses, when at home or in garrison, always in a state fit for active service. The evil of not attending to this was very severely experienced during the Spanish campaigns. The artillery horses sent from Chatham were found to be unfit for the fatigues of service, and good cart-horses were at last substituted with great advantage. In garrison both men and horses are over-fed and under-worked. In manufactories the opposite evils sometimes occur; the workmen, and especially the children, are over-worked and under-fed. This subject has lately occupied the attention of parliament; and it is connected with some interesting inquiries, which belong properly to the science of political economy. In a medical point of view, the principle to be followed is, that the food and labour bear a just proportion to each other. When the quantity and quality of the food is not limited by its expense, the best possible condition of the individual is attainable, by attending to the principles upon which training is conducted, and which resolve themselves into temperance without abstemiousness, and regular exercise in the open air. Mr Jackson says, that a man properly trained feels himself light and *corky*, as the technical phrase is; and that, during a course of training, the skin always becomes clear, smooth, well coloured, and elastic; or that cleanness of skin is the best proof of a man being in good condition. Another very striking effect of training is upon the lungs. Trained men can draw a much fuller inspiration, and retain their breath longer, than others. But it is not only on the state of bodily health that the good effects of training are conspicuous; for Mr Jackson distinctly, and we believe correctly, states, that the mental faculties are always improved, the attention is more ready, and the perceptions are more acute. From these observations some valuable hints may be derived by physicians, for the cure of many cutaneous and pulmonary affections, which obstinately resist the power of medicines.

Cookery.

Cookery is strictly a branch of dietetics, and one of the most important. Only a small part of our food is consumed as it is furnished by nature. Many alimentary substances are disagreeable, and some even poisonous, until they have undergone certain preparations. Few of them are to be had at all seasons of the year, although produced at others in greater quantity than can be consumed; and all of them occur of very different qualities. Hence the selection, preservation, and preparation of alimentary substances, are arts of primary importance in life.

We hold the contempt with which cookery is very generally spoken of to be downright affectation, we had almost said hypocrisy; for, in the practice of life, every individual who is not perfectly imbecile and devoid of understanding is an epicure in his own way. The epicures in the boiling of potatoes even are innumerable; and every school-boy in Scotland passes a judgment on the culinary skill of the servant who makes his porridge. Cookery only becomes truly degrading when it occupies an undue proportion of attention; and that epicurism is to be utterly condemned which produces more pain than pleasure. Boswell, the biographer of Johnson, has defined man to be a cooking animal; and, in fact, man is the only animal which does not consume his food as presented to him by nature. We are not from this to conclude that man in cooking deviates from the ordinary course of nature; but that the appetite for cooked food is given to him for wise and useful ends. Count Rumford has not considered the pleasure of eating, and the means that may be employed for increasing it, as unworthy the attention of a philosopher.

"The enjoyments which fall to the lot of the bulk of mankind are not so numerous as to render an attempt to increase them superfluous. And even in regard to those who have it in their power to gratify their appetites to the utmost extent of their wishes, it is surely rendering them a very important service to show them how they may increase their pleasures without destroying their health.

"If a glutton can be made to gormandize two hours upon two ounces of meat, it is certainly much better for him, than to give himself an indigestion by eating two pounds in the same time.

"The pleasure enjoyed in eating depends first upon the agreeableness of the taste of the food; and, secondly, upon its powers to affect the palate. Now there are many substances extremely cheap, by which very agreeable tastes may be given to food, particularly when the basis or nutritive substance of the food is tasteless; and the effect of any kind of palatable solid food (of meat, for instance) upon the organs of taste, may be increased almost indefinitely, by reducing the size of the particles of such food, and causing it to act upon the palate by a larger surface. And if means be used to prevent its being swallowed too soon, which may be easily done by mixing with it some hard and tasteless substance, such as crumbs of bread rendered hard by toasting, or any thing else of that kind, by which a long mastication is rendered necessary, the enjoyment of eating may be greatly increased and prolonged.

"The idea of occupying a person a great while, and affording him much pleasure at the same time, in eating a small quantity of food, may perhaps appear ridiculous to some; but those who consider the matter attentively will perceive that it is very important. It is, perhaps, as

[1] The Code of Health and Longevity, vol. ii. Appendix, No. IV. 8vo, Edinburgh, 1807.

much so as any thing that can employ the attention of the philosopher."

But we shall consider cookery in another point of view, and that one, the importance of which will not be denied by the most austere philosopher. The political economists have extolled agriculture above all other arts, and have obtained the assent of mankind to their dogma, that he who makes two blades of grass grow where only one grew before, is a benefactor to his race. And why? Truly because he thus increases the quantity of food, and enables the world to support a larger population. And is not he who by his skill enables the raw material, whether corn or flesh, furnished to him by the agriculturist, to feed a larger population, or who renders articles alimentary which were formerly rejected, equally a benefactor of his race? Again, every country has its own favourite articles of food, and modes of preparing them; and there is perhaps no subject in regard to which local prejudices are so strong. Now, by bringing these to the test of comparison upon scientific principles, much good would ultimately arise by the gradual introduction into each country of whatever was worthy of imitation in the practice of other nations.

The learned Krunitz, in his voluminous *Economico-Technologic Encyclopedia*, has anticipated many of our views of the subject. "The preparation of good food, and the directions for this purpose contained in cookery books, are commonly very much despised, or rather altogether neglected, by literary men. But in itself cookery does not deserve this contempt, for it is an important part of domestic economy. Upon its due practice depend the health and comfort of families, which must inevitably suffer from errors committed in it. The reason of this contempt is to be found in the manner in which it has hitherto been treated in cookery books, which have been prepared by common cooks, as they are accustomed to dress a ragout. Since the economical arts in general have been discussed scientifically, it is now time that the same attention should be paid to cookery, which is so generally useful, and which is capable of being considered in so many points of view. But then a totally different course from that commonly followed must be pursued. A man of much knowledge, especially physical, chemical, and dietetical, must condescend to apply to the making experiments on vulgar and refined cookery, and collect the whole into a system, as has been done long since in regard to the knowledge and preparation of medicines. What has been written upon dietetics by Zückert, Bergius, Lorry, Plenk, and others, must be compared with the practices in different countries, and a general view of the whole must be drawn up and arranged in systematic order. In regard to the preparations themselves, certain fixed processes and principles are to be determined, general operations to be accurately described, and new improvements to be brought forward. After this the subject might be treated in detail, and a variety, first of simple, then of more compound articles, with the best modes of preparing each as to palatableness, and in relation to effect upon the health, should be perspicuously and thoroughly described. Lastly, their combination into bills of fare, adapted to different ranks in society, modes of life, various tastes, the season of the year, &c. should be pointed out particularly, and with a due regard to good economical arrangements." (A. D.)

DIEU ET MON DROIT, *i.e.*, *God and my Right*, the motto of the royal arms of England, first assumed by Richard I. to intimate that he did not hold his empire in vassalage of any mortal. It was afterwards assumed by Edward III., and was continued without interruption to the time of William, who used the motto *Je maintiendray*, though the former was still retained upon the great seal. After him Anne used the motto *Semper eadem*, which had been before used by Elizabeth; but ever since the time of Anne, *Dieu et mon Droit* has continued to be the royal motto.

DIFF, or DOUFF, an Arabian musical instrument of the same kind as the *tambour de Basque* or tambourine.

DIFFARREATIO, in *Roman Antiquity*, a ceremony by which a marriage which had been contracted by the solemn form of *confarreatio* was dissolved. The word comes from the preposition *dis*, which is used, in composition, for *division* or *separation*, and *farreatio*, a ceremony with wheat, from *far*, wheat or corn. See CONFARREATIO.

DIFFERENCE, in *Mathematics*, the remainder of a sum or quantity after a lesser number or quantity has been subtracted from it.

DIFFERENCE, in *Logic*, an essential attribute, belonging to some species, and not found in the genus; being the idea that defines the species. Thus body and spirit are the two species of substance, which in their ideas include something more than is included in the idea of substance. In body, for instance, are found impenetrability and extension; and in spirit, a power of thinking and reasoning; so that the difference of body is impenetrable extension, and the difference of spirit is cogitation.

DIFFERENCE, in *Heraldry*, a term given to a certain figure added to coats of arms, serving to distinguish one family from another, or to show how distant a younger branch is from the elder or principal branch.

DIFFERENTIAL, in the higher geometry, an infinitely small quantity, so small as to be less than any assignable quantity. It is called a *differential*, or *differential quantity*, because frequently considered as the difference of two quantities; and, as such, it is the foundation of *differential calculus*. Sir Isaac Newton and the English call it a *moment*, from its being considered as the momentary increase of quantity. See FLUXIONS.

DIFFERENTIAL *Equation* is an equation involving or containing differential quantities, as the equation $3x^2dx - 2axdx + aydx + axdy = 0$. Some mathematicians have also applied the term differential equation in another sense, to certain equations defining the nature of facts.

DIFFERENTIAL CALCULUS, or *Method*, a method of finding quantities by means of their successive differences. See FLUXIONS.

DIFFERENTIAL THERMOMETER, an instrument for measuring differences of temperature. See METEOROLOGY.

DIFFORM (*difformis*, from *dis*, asunder, and *forma*, shape), is a word used in opposition to uniform; irregularity in form or appearance; as a difform flower or corolla, the parts of which do not correspond in size or proportion.

DIFFUSION (Lat. *diffundo*, to *pour out*), a spreading or flowing of a liquid or a fluid, as of water, air, light: a scattering or dispersing.

DIFFUSION *of Gases*, a term in chemistry, denoting the mixing, in any relative proportions, of two gaseous bodies which do not act chemically on each other; so that whatever be their relative densities they remain permanently blended. Hence Dalton has represented gaseous bodies as acting as *vacua* to each other.

DIGAMMA, an obsolete letter of the Greek alphabet, equivalent in sound to the English *v*. In the Æolic, and sometimes in the Ionic dialect, the old Greek γ was a kind of aspirate called from the manner of writing it *Digamma* (Ϝ). This aspirate was carried by the Pelasgic race into

Italy, and remained in Latin as a real consonant, V, as may be seen from many words originally Greek, such as Ϝοῖνος, Ϝοῖκος, *vinum*, *vicus*. It disappeared from the Greek tongue so early that it ceased to be written in the Homeric poems; and many even deny its influence in softening the *hiatus*, while others allow this effect even in Pindar.

DIGBY, Sir Kenelme, an eminent English philosopher, was born at Gothurst, Buckinghamshire, in 1603. He was descended from an ancient and illustrious family. His great-grandfather had distinguished himself at Bosworth on the side of Henry VII.; and his father, Sir Everard Digby, was one of the leading Roman Catholic gentry at the time of the Gunpowder Plot. Having risen in arms on that occasion, Sir Everard was apprehended, tried, and executed at London, Jan. 27, 1606. The young philosopher was thus three years old at his father's death, and was educated by his guardians in the Protestant faith. Having finished his education at Oxford, he went abroad in 1621; and on his return he received from Charles I. the appointments of gentleman of the bed-chamber, commissioner of the navy, and governor of Trinity House. At the head of a small squadron he sailed in 1628 against the Algerines, and afterwards defeated the Venetians near the port of Scanderoon. During a brief stay in Paris, he joined the Church of Rome. Having returned to England in 1638, he espoused the cause of the king, and was imprisoned in Winchester House by order of the parliament. He was, however, liberated in 1643, and retired to France, where he was taken into the confidence of the court, and enjoyed the friendship of Descartes and other learned men. Here he wrote his *Treatise on the Nature of Bodies*, his *Treatise on the Soul*, *Peripatetick Institutions*, and other works. He visited England during the Protectorate of Cromwell, and seemed to be more zealous for the advancement of the interests of the Commonwealth than befitted a staunch royalist. At the Restoration he returned finally to London, where he died in 1663. He married Venetia Anastasia, the daughter of Sir Edward Stanley of Shropshire, "a lady of an extraordinary beauty and of as extraordinary a fame." His whimsical experiments to preserve her beauty procured him as much notoriety as his sympathetic powder for the cure of wounds at a distance. Besides the works already mentioned, Digby wrote *A Conference about a Choice of Religion*, Paris, 1638; Letters on the same subject, Lond. 1651; *Observations on Religio Medici*, Lond. 1643; *A Treatise of Adhering to God*, Lond. 1654; *On the Cure of Wounds by the Powder of Sympathy*, Lond. 1658; and a *Discourse on Vegetation*.

DIGENTIA, now the *Licenza*, a small river of Italy, flowing into the Anio about nine miles from Tivoli. In a historical point of view, the Digentia is quite unimportant, but it is highly interesting as the stream on whose banks Horace's Sabine farm was situated. Numerous allusions to the Digentia and the surrounding scenery occur in the works of that poet. The whole topography of this interesting district will be found fully discussed in Champy's *Maison d'Horace*, and in Milman's *Life of Horace*.

DIGEST (*Digestum*), a collection of the Roman laws, arranged and digested under proper titles, by order of the Emperor Justinian. See Civil Law.

DIGESTER, a strong metal vessel with an air-tight lid furnished with a safety valve, in which substances may be subjected to a very much higher temperature than in the ordinary method of boiling. This apparatus is figured and described under the head Steam.

DIGESTION, in the animal economy, is the dissolution of the aliments into such a state as renders them fit to pass into the lacteal vessels, and thence into the blood. See Gastric Juice.

Digestion, in *Chemistry*, the operation of exposing bodies to a gentle heat in order to assist their action upon each other; or the slow action of a solvent on any substance.

DIGGES, Leonard, an able mathematician in the sixteenth century, was born at Digges Court, in the parish of Barham, Kent, and was educated at Oxford. He was the author of the following works: viz., *Tectonicum, briefly showing the exact Measuring and speedy Reckoning of all manner of Lands, Squares, Timber, Stones, Steeples*, &c., 1556, 4to; a geometrical practical treatise, named *Pantometria*, in three books, published posthumously by his son in 1591; and *Prognostication Everlasting of right good effect, or Choice Rules to judge the Weather by the Sun, Moon, and Stars*, &c., 4to, 1555, 1556, and 1564; afterwards corrected and augmented by his son, 4to, 1592. Digges died about 1574.

Digges, *Thomas*, only son of the preceding, and one of the ablest mathematicians of his age. He was sent by Queen Elizabeth as muster-master-general of the British forces in the Netherlands, and thus acquired an extensive and accurate knowledge of military affairs. He died in 1595.

Besides revising, correcting, and enlarging some of his father's works, he wrote *Alæ sive Scalæ Mathematicæ, or Mathematical Wings or Ladders*, 1573, 4to; *An Arithmetical Military Treatise*, containing so much of Arithmetic as is necessary towards military discipline, 1579, 4to; *A Geometrical Treatise, named Stratioticos, requisite for the perfection of Soldiers*, 1579, 4to; *A perfect Description of the Celestial Orbs, according to the most ancient doctrine of the Pythagoreans*, &c., placed at the end of his father's *Prognostication Everlasting*, printed in 1592, 4to; *A humble motive for association to maintain the Religion established*, 1601, 8vo—to which is added, his *Letter to the same purpose to the Archbishops and Bishops of England; England's Defence*, or, *a Treatise concerning Invasion*, a tract of the same nature with that printed at the end of his Stratioticos, and called a *Briefe Discourse*, &c., but not published till 1686; A letter printed before Dr John Dee's *Parallaticæ Commentationis praxeosque nucleus quidam*, 1573, 4to. Besides these and his *Nova Corpora*, he left several mathematical treatises ready for the press, which, by reason of law-suits and other engagements, he was prevented from publishing.

DIGGING, among miners, the operation of freeing ore from the bed or stratum in which it lies, where every stroke of their tools turns to account; in contradistinction to the openings made in search of ore, which are called *hatches*, or *essay-hatches*, and the operation itself named *tracing of mines*, or *hatching*.

DIGIT (Lat. *digitus*, a *finger*), the measure of a finger's breadth, or three-fourths of an inch.

Digit, or *Monade*, in *Arithmetic*, any integer under ten, as, 1, 2, 3, 4, 5, 6, 7, 8, 9, and by means of which all numbers are expressed.

Digit, in *Astronomy*, the twelfth part of the diameter of the sun or moon; a term used to express the quantity of an eclipse. Thus an eclipse is said to be of six digits when one-half of the disk is hid.

DIGITALIS, a genus of scrophulariaceous plants. See Botany.

DIGLYPH, in *Architecture*, a kind of imperfect triglyph, console, or the like, with two channels or engravings, either circular or angular.

DIGNE (the ancient *Dina* or *Dinia*), a town of France, capital of the department of Basses-Alpes, and of a cognominal arrondissement, is situated at the foot of the Alps, on the left bank of the Bleone, 55 miles N.E. of Aix. Pop. (1851) 4119. The streets are generally narrow, crooked, and filthy, and the houses mean. The principal buildings are the cathedral and bishop's palace. Digne is the seat of courts of primary instance, assize, and commerce, a communal college, agricultural society; and has a public library, tanneries, and some trade in cattle and agricultural and garden produce. In the vicinity are saline springs in some repute.

DIGNITARY, a person who holds an ecclesiastical benefice or dignity which gives him some pre-eminence over mere priests; as a bishop, dean, archdeacon, prebendary, &c.

DIGNITY, as applied to the titles of noblemen, signifies

honour and authority. Dignity may be divided into superior and inferior; as the titles of duke, marquis, earl, baron, &c., which are the highest of dignities, and those of baronet, knight, serjeant-at-law, &c., which are the lowest. Nobility only can give so high a name of dignity as to supply the want of a surname in legal proceedings; and as the omission of a name of dignity may be pleaded in abatement of a writ, so it may also be where a peer who has more than one name of dignity is not named by the most noble. No temporal dignity of any foreign nation can give a man a higher title in this country than that of esquire.

Dignity, in the human character, the opposite of meanness.

DII, the divinities worshipped by the ancient inhabitants of the earth, were very numerous. Every object which caused terror, inspired gratitude, or bestowed affluence, received the tribute of veneration. Man saw a superior agent in the stars, the elements, or the trees; and supposed that the waters which communicated fertility to his fields and possessions were under the influence and direction of some invisible power inclined to favour and to benefit mankind. Thus arose a train of divinities, which imagination arrayed in different forms, and armed with different powers. They were endowed with understanding, and actuated by the same passions as men; and these creations of superstition were appeased or provoked in the same manner as the imperfect being who gave them birth. Their wrath was mitigated by sacrifices and incense, and sometimes human victims bled to expiate a crime which superstition alone supposed to exist. The sun, from its powerful influence and animating nature, first attracted the notice and claimed the adoration of the uncivilized inhabitants of the earth. The moon also was honoured with sacrifices and addressed in prayers; and after immortality had been liberally bestowed on all the heavenly bodies, mankind classed amongst their deities the brute creation, and the cat and the sow shared equally with Jupiter himself, the father of gods and men, the devout veneration of their votaries. This immense number of deities has been divided into different classes, according to the will and pleasure of the mythologists. The Romans, generally speaking, reckoned two classes of the gods, the *dii majorum gentium* or *dii consentes*, and the *dii minorum gentium*. The former were twelve in number, namely, six males and six females. (See Consentes.) In the class of the latter were ranked all the gods who were worshipped in different parts of the earth. Besides these, there were divinities called *dii selecti*, sometimes classed with the twelve greater gods; these were Janus, Saturn, the Genius, the Moon, Pluto, and Bacchus. There were also some called demigods, that is, persons who were considered deserving of immortality by the greatness of their exploits, or for their uncommon services to mankind. Amongst these were Priapus, Vertumnus, Hercules, and those whose parents were some of the immortal gods. Besides these, all the passions and the moral virtues were reckoned as powerful deities; and temples were raised to a goddess of concord, of peace, and the like. According to Hesiod, there were no less than thirty thousand gods that inhabited the earth, and were guardians of men, all subservient to the power of Jupiter. To these deities succeeding ages added an almost incredible number; and indeed they were so numerous, and their functions so various, that we find temples erected, and sacrifices offered, to *unknown gods*. It is observable that all the gods of the ancients had lived upon earth as mere mortals; nay even Jupiter, who was the ruler of heaven, is represented by the mythologists as a helpless child; and we are acquainted with all the particulars which attended the birth and education of Juno. In process of time not only good and virtuous men, who had been the patrons of learning and the supporters of liberty, but also thieves and pirates, were admitted amongst the gods; and the Roman senate courteously granted the honour of apotheosis to the most cruel and profligate of their emperors.

DIIAMBUS, in the *Ancient Poetry*, a double iambus, as *sĕvērĭtās*.

DIJON (the ancient *Dibio, Divio, Divionense Castrum*), a town of France, formerly the capital of the duchy of Burgundy, now of the department of Côte d'Or, and of an arrondissement of its own name. This town is of considerable antiquity, and is said by some to have been in existence previous to the Roman Conquest; but if so, it must have been a place of small importance. The more common opinion is, that it was founded by Marcus Aurelius, by whom it was also surrounded with walls, flanked with towers. It was considerably enlarged and improved by Aurelian about 274. It seems to have been, probably about this time, important for its manufactures of iron, from an inscription found here which speaks of the inhabitants as, "*Fabri Ferrarii Dibionenses.*" Dijon, if not the capital, was at least one of the principal towns of the first kingdom of Burgundy. It was destroyed by fire in 1137, but rebuilt twenty years afterwards; and from 1179 to the death of Charles the *Rash* it was the ordinary residence of the dukes of Burgundy.

Dijon is situated in a pleasant and fertile plain at the foot of the Côte d'Or mountains, 105 miles N. of Lyons, and 160 S.E. of Paris; in 47. 19. 25. N. Lat., and 6. 2. 5. E. Long. It is surrounded by ramparts planted with trees, and has five gates. Outside the walls are avenues, parks, and other agreeable promenades. Its southern walls are washed by the Ouche; and the small stream of Suzon traverses it from N. to S. by a channel under the streets, and contributes greatly to the cleanliness for which this town is remarkable. Dijon is generally well built, the streets are wide and well paved, and the houses neat and built of freestone. It contains many remarkable buildings, some of them of great antiquity. The present cathedral, dedicated to St Benigne, was rebuilt in 1271, the previous edifice having been founded in the fifth century. It is a fine specimen of the Gothic style, contains some handsome monuments, and is surmounted by a light and elegant wooden spire 330 feet in height. The church of Notre Dame is a singularly fine specimen of the purest Gothic, and is remarkable for the boldness of its construction. The portal of the church of St Michael is composed of three circular arches, with a very fine frieze above. Many of the ancient churches have been converted into stables, warehouses, &c. That of St Etienne is now used as a covered market, and St Philibert as cavalry barracks; some of these, however, are still worthy of notice for their architecture, as St Jean, which is remarkable for the span of its roof. The palace of the dukes of Burgundy has had its principal front modernized, but otherwise it still retains most of its ancient features. It is now used as public offices, and a portion of it is allotted to an extensive museum. It is surmounted by lofty towers, now used as an observatory. The castle, commenced by Louis XI., and finished by Louis XII. in 1513, became in the eighteenth century a state prison, in which the duchess of Maine, Mirabeau, and others were confined; and now serves as a barracks for the *gens-d'armes*. Dijon is the seat of a bishop, a royal court, tribunals of primary instance and commerce, and of a university and academy, having faculties of law, science, and literature; and has a special school of the fine arts, a royal college, a primary normal school, a seminary, a royal academy of sciences and *belles-lettres*, a botanic garden, agricultural society, and a public library of upwards of 40,000 vols. It has manufactures of woollen, linen, and cotton goods, hats, leather, soap, vinegar, mustard, starch, and brandy; but its principal dependence is on the wine trade, being the chief depôt and market for the sale of Burgundy. Dijon has produced a number of cele-

brated men, of whom may be mentioned Bossuet, Crebillon, Longepierre, and Daubenton. Pop. (1851) 28,998.

DIIPOLEIA, in *Grecian Antiquity*, the name of a festival. See BUPHONIA.

DIKE (Δίκη), the goddess of justice, was, according to Hesiod, the daughter of Jupiter and Themis. The special office of Dike was to punish injustice and to reward virtue. She regarded with particular abhorrence all unjust judges, whose misdemeanours she instantly reported to Jupiter. In the oldest works of art, as for instance the chest of Cypselus, Dike is represented as a young and handsome female, dragging with one hand an old and ugly hag, Adikia (Injustice), while in the other she holds a staff with which to beat her. In the dramas of the three great tragedians of ancient Greece, the idea of Dike or retribution is wrought out with great care, and sometimes, as by Æschylus, with very great success.

DIKE, or *Dyke*, in its primary sense, denotes a ditch or drain. The word seems to have been formed from the verb *to dig;* though others derive it from the Dutch *dijk*, a dam, sea-bank, or wall. It is generally used to signify a work of stone, timber, or fascines, raised to oppose the entrance or passage of the waters of the sea, a river, lake, or the like. Junius and Ménage conceive the Flemish to have borrowed their word from the Greek τεῖχος, *wall;* but Guichard derives it from the Hebrew *dayhah*.

Dyke is also a geological term denoting a mass of unstratified or igneous rock, such as trap, granite, or lava, which appears as if injected into rents and fissures in the stratified rocks. Veins of basalt, greenstone, &c., sometimes present the appearance of walls, standing detached on the surface of a country.

DILAPIDATION, in *Law*, signifies both a wasteful destroying, and the suffering buildings to fall to decay for want of necessary repairs. If a clergyman neglect to repair any house or building belonging to his benefice, the bishop may sequester the profits thereof for that purpose; and in such a case a prosecution may be brought, either in the spiritual court or at common law, against the incumbent himself, or against his executor or administrator. Dilapidation extends also to the waste or destruction of wood, &c.

DILATATION, the act of expanding; a spreading or enlarging in every direction. It is opposed to contraction; and differs from extension, as the latter is applied to lines and surfaces. A line is *extended*; a balloon or an artery is *dilated*.

DILEMMA, in *Logic*, an argument equally conclusive by contrary suppositions. Hence, used to signify any difficult or doubtful state of things, which renders one uncertain what course to pursue.

DILETTANTE (Italian), an admirer of the fine arts; or one who delights in promoting the fine arts.

DILIGENCE, in *Scots Law*, a general term for the process by which persons, lands, or effects are attached on execution, or in security for debt.

DILL, an annual plant, *Anethum graveolens*. It is cultivated for its aromatic seeds, which are used medicinally as a carminative.

DILLENBURG, a town in the duchy of Nassau, capital of a bailiwick of the same name, situated on the Dill, an affluent of the Lahn, 16 miles N.W. of Wetzlar. It is the seat of a court of appeal; and has manufactures of tobacco and potash. In the vicinity is an extensive copper foundry. Pop. 2600.

DILLENIUS, JOHN JAMES, a distinguished botanist of the eighteenth century, who may be called the father of cryptogamic botany, was born at Darmstadt in 1687. He was educated as a physician in the university of Giessen; but his attention was very early diverted from medical studies to the observation and discrimination of plants; nor does he appear to have ever followed any branch of the practice of physic. In botany he was strictly a practical observer, having addicted himself but little to the principles of classification, and not at all to the physiology of vegetables. Some branches of zoology occasionally engaged him, which in their native situations can hardly escape an assiduous collector of plants, so closely are these studies, especially that of insects and the lower tribes of animated beings, connected with botany. Dillenius, whilst at Giessen, wrote several papers for the *Ephemerides Naturæ Curiosorum*, on American plants naturalized in Europe, on coffee, on opium obtained from poppies in Germany, with some minute critical remarks on *Spergula pentandra*, as well as on various cryptogamous plants. He published also a paper on leeches, and on two species of *papilio*. He printed at Giessen in 1719 his *Catalogus Plantarum sponte circa Gissam nascentium*, a valuable little octavo volume, with figures drawn and engraved by his own hand, of the parts of fructification, particularly designed to illustrate the generic characters of plants previously not well arranged or understood. In this work he established many new genera, which have for the most part kept their ground. His great merit as a general botanist consisted in a constant attention to the only sound principle of scientific botany, the discrimination of *genera* by the parts of the flower and fruit. This principle, first proposed by the great Conrad Gesner, Dillenius applied to practice, with a severer judgment and closer attention than perhaps any other person from Gesner to Linnæus. The little book in question is arranged most inconveniently according to the times of the plants flowering. In the preface, however, he enters into the subject of classification, a subject to which young botanists are generally prone, but of which they as generally, after having embroiled it, take their leave, in proportion as they acquire more practical knowledge. Dillenius so far displayed his judgment, that he rather showed the faults of the systems of Tournefort, Knaut, and Rivinus, than offered anything of his own. This led him into some controversies, from which he soon disengaged himself, and never subsequently took up the question at all.

The great William Sherard, while returning in 1718 from Smyrna through Germany, met with Dillenius, whose scientific merit could not have escaped so eminent a botanist. He brought him to England in 1721, and excited him to publish, in 1724, that valuable enlarged edition of Ray's *Synopsis* of British plants, which has ever since been in general use, and which the editor enriched with engravings of his own. In this publication, compared with the *Catalogus* of the plants of Giessen above mentioned, we cannot but perceive the difference between an author working upon his own original materials, and the commentator or illustrator of the labours of another. Though Dillenius made numerous and correct additions to Ray's work, in the cryptogamic tribes at least, he rather confused than improved the other parts of the book, especially with regard to synonyms, in which department he was never supremely accurate.

In 1732, Dillenius published his magnificent *Hortus Elthamensis*, in two volumes folio, containing 324 plates, engraved on pewter, with his own hand. Their merit consists in their very great precision and fidelity. The descriptions, and historical as well as botanical remarks, render this a classical book in botany. Its style is good, and the whole performance is worthy of the author, and of his eminent patron, whose brother, Dr James Sherard, was the owner of the garden at Eltham, which furnished the rich materials of this publication. Before this book appeared, its author was established at Oxford, in the new professorship founded there by the will of William Sherard, who died in August 1728, and who left L.3000 for the purpose, besides his own library, manuscripts, and ample herbarium.

Dillenius took the degree of M.D. in this university in 1735, though he had previously obtained the same rank at Giessen; and he now devoted himself to the completion of the *Pinax*, or universal collection of synonyms, which was Sherard's chief object in this foundation. The work was never finished; for indeed neither Dillenius nor any one else could even at that time be competent to it: still less, as botanists and botanical works multiplied excessively, was this undertaking practicable. The publications of Linnæus soon rendered it unnecessary. That illustrious foreigner in 1736 visited Dillenius, who was desirous of fixing him here as his coadjutor; but to this scheme there were several impediments. Nevertheless these distinguished men continued ever after in correspondence, certainly to the advantage of their common study, except in one but too important instance. We allude to the theory of the fructification of mosses, in which Linnæus implicitly adopted the faulty opinion of the Oxford professor, contrary to his own better observation and judgment, taking the capsule for the anther. This leads us to mention the immortal work on which the fame of Dillenius rests, and which, in its way, will never be excelled, the *Historia Muscorum*, published in 1741, in one quarto volume, with eighty-five plates, drawn and engraved by the author. In this performance, laborious investigation, acute discrimination, supreme accuracy, and profound learning, are displayed beyond all example or comparison. Following inquirers, like the celebrated Hedwig, may, with better helps, have examined the same objects more deeply; but none has taken so complete a view of the subject, nor made so very few mistakes. No botanical book perhaps is so perfect in synonyms. Whether the labour of this undertaking was too much for the health of its author, or whether his sedentary mode of life was, on the whole, injurious, we have no particular information; but he began, soon after the publication of the *Historia Muscorum*, to complain of ill health and advancing age. He was of a short stature and corpulent habit, and died of an apoplexy April 2, 1747, in his sixtieth year. A picture of this distinguished botanist is preserved in the picture-gallery at Oxford, from which a print has been published in Sim's and König's *Annals of Botany*, vol. ii. Dillenius is said to have been amiable and respectable in his private character. He never married. His books and collection of mosses referring to his great work, with many drawings, especially of *Fungi*, were bought by his successor Dr Humphrey Sibthorp, and added to the Sherardian Museum, where they still remain. (J. E. S.)

DILLINGEN, a town of Bavaria, in the circle of Suabia, on the left bank of the Danube, 24 miles N.W. of Augsburg. Pop. 3500. It was formerly the ordinary residence of the bishops of Augsburg, and the seat of a university founded in 1552, but abolished in 1804. It has a lyceum, gymnasium, and other schools, 4 churches, 2 chapels, 2 monasteries, an orphan asylum, ship-building docks, paper mills, and some trade. There is also a small town of this name in Rhenish Prussia, 26 miles south of Treves.

DILUTE, to render liquid, or more liquid, or to weaken the strength by the addition of a fluid that is thinner or weaker. The fluids thus added are called *diluents*.

DILUVIAL, pertaining to, or effected by, a flood or deluge; a term used more especially with reference to the great deluge in the days of Noah.

DIMACHÆ (δις, *double*, and μάχομαι, *I fight*), in *Antiquity*, Macedonian horsemen, who sometimes fought also on foot, like our dragoons. This species of troops was first introduced by Alexander the Great.

DIMENSION, in *Geometry*, denotes either length, breadth, or thickness. A line has one dimension, or length; a superficies two, length and breadth; and a solid has three, length, breadth, and thickness.

DIMINUTION, in *Architecture*, the gradual decrease in the diameter of the shaft of a column from the base to the capital.

DIMINUTION, in *Music*, is the abating something of the full value or quantity of any note.

DIMINUTIVE, in *Grammar*, a word formed from some other, either to diminish its force or to signify that a thing is little in its kind. Thus, *cellule* is a diminutive of *cell*, *globule* of *globe*, *hillock* of *hill*.

DIMISSORY LETTER (*Literæ Dimissoriæ*), in the canon law, a letter given by a bishop to a candidate for holy orders having a title in his diocese, directed to some other bishop, and giving permission for the ordination of the bearer.

When a person produces letters of ordination or tonsure conferred by any other than his own diocesan, he must, at the same time, on pain of nullity, produce the letter dimissory given by his own bishop. Letters dimissory cannot be given by the chapter, *sede vacante;* this being deemed an act of voluntary jurisdiction, which ought to be reserved to the successor.

DIMITY, a kind of cotton cloth similar in fabric to fustian, but less stout, and frequently ornamented with crossbars or stripes. It was originally imported from India, but is now extensively manufactured in Britain, especially in Lancashire.

DIMSDALE, THOMAS, Baron, an English physician, greatly distinguished by his practice of inoculation for the smallpox, was the son of a surgeon and apothecary at Theydon-Gernon, in Essex, and was born in 1712. His family belonged to the society of Quakers; and his grandfather, after having accompanied William Penn to America, had returned and settled in his native village. Thomas was educated for the medical profession, and commenced his practice at Hertford about 1734. Here he married the only daughter of Nathaniel Brassey, an eminent London banker; and at her death in 1744 he became assistant physician to the forces under the Duke of Cumberland, and continued with the army till the surrender of Carlisle. Having returned to Hertford, he married, in 1746, Anne Iles, and by her fortune he was enabled to retire from practice. He afterwards resumed it, and took the degree of doctor of medicine in 1761. His reputation procured him an invitation to inoculate the Empress Catherine of Russia and her son in 1768; and for his services he was rewarded with the appointments of counsellor of state and physician to her Majesty, with an annuity of L.500. He was also raised to the rank of a Russian baron, and received a present of L.10,000, besides miniature pictures of the empress and her son. After having inoculated great numbers of the inhabitants of Moscow, he went to the court of Frederick II. king of Prussia, at Sans Souci, and thence returned to England. In 1776 he published his treatise on inoculation, a work which was translated into all the modern languages, not excepting the Russian, and widely circulated over the Continent. In 1779 he lost his second wife; but afterwards married Elizabeth, daughter of William Dimsdale of Bishops-Stortford, who survived him. He was elected representative of the borough of Hertford in 1780, and went again to Russia in 1781, to inoculate some of the imperial family. On returning to England, he again fixed his residence at Hertford, where he died, Dec. 30, 1800, after an illness of about three weeks.

DINAGEPORE, a town in Hindustan, the principal place of the British district of the same name within the jurisdiction of the lieutenant-governorship of Bengal, is situate on the left bank of the Pernabubah river, 260 miles north of Calcutta. The town has no public buildings deserving particular notice; but it is clean and well watched, and contains a population of 30,000. The district of which this place is the capital is bounded on the N.E. by the native state of Bhotan; E. by that of Cooch Behar and the British district of Rungpore; S. by Bograh, Rajeshaye,

and Malda; W. by Purneah; and N. by the British territory of Darjeeling. It extends from Lat. 24. 53. to 26. 38., and from Long. 88. 2. to 89. 16. Area 3820 square miles. This district possesses a soil much diversified; and the face of the country has a waving appearance, being divided into small valleys, each about two or three miles broad. Besides the Pernabubah already mentioned, the principal rivers are the Teesta, Attree, Jabuna, and Curateea. The district is moreover intersected by numerous smaller streams, which in the rainy season overflow the low lands, and swell into large lakes fifty or sixty miles in length, which, while the Ganges is in flood, have no outlet; and thus are so much increased as to be navigable for vessels of considerable burden. After the inundation these low lands become covered with a luxuriant pasture, on which are fed numerous buffaloes, and large herds of other cattle; or with rich crops of rice, which is the great staple of agriculture; besides tobacco, indigo, and hemp. The land does not answer for wheat or barley. The soil of the elevated portions of the country is in general a stiff clay, in some places black and porous, in others stiff and tenacious. Many sorts of fibrous plants for cordage and sackcloth are sown in April, May, and June. Several sorts of pulse are also sown at the commencement of the cold season; and, where the soil is good, the sugar cane is planted in February and March. The inhabitants are in general extremely poor, and their farming utensils are proportionally rude. They are in the proportion of seven Mussulmans to three Hindus. Among both marriages take place at a premature age; the effects of which are stated to be manifested in the deterioration of the inhabitants, who are described as a weak and puny race. The population has been estimated at 1,200,000. Dinagepore constituted one of the provinces of the empire of Delhi, and was transferred with the remainder of Bengal to the East India Company in 1765, by the grant of the emperor Shah Alum. The town of Dinagepore is in Lat. 25. 34., Long. 88. 38. (E. T.)

DINAN, a town of France, capital of an arrondissement of the same name, in the department of Côtes-du-Nord, pleasantly situated on an eminence near the left bank of the Rance, 32 miles E. of St Brieuc. It is surrounded by walls of great thickness, and is defended by an old castle. The town is ill-built, and the streets are generally narrow and dirty, though some of them have lately been much improved. Dinan is the seat of a court of primary instance; and has a communal college, hospital, concert-hall, public library, and manufactures of sailcloth, cottons, hats, shoes, leather, &c. Vessels of from 70 to 90 tons come up to the town, and a considerable trade in butter, hemp, thread, &c., is carried on. Dinan is connected with Rennes by means of the canal of Ille-et-Rance. Pop. (1851) 7732.

DINANT, a town of Belgium, province of Namur, and capital of a cognominal arrondissement, on the Meuse, 12 miles S. of Namur. It occupies the declivity of a rocky hill, the summit of which is crowned by a castle; and has a Gothic cathedral richly decorated in the interior, two hospitals, and a Latin school; besides salt refineries, tanneries, breweries; and oil, flour, hemp, and paper mills, and mills for cutting and polishing marble. Pop. (1851) 6867. Dinant is a place of great antiquity, for we find that a church was consecrated here in 558, and a second in 604. It did not, however, rise to any great importance till the eleventh century. In the twelfth century it was fortified, and was considered a place of great strength. In 1466 Philip the Good, duke of Burgundy, took and destroyed the town and its fortifications; but, three years later, his successor, Charles, allowed it to be rebuilt. It was taken and pillaged by the French in 1554, and again in 1675. By the treaty of Ryswick in 1697 it was restored to the Bishop of Liège, but was again taken by the French in 1794, and became the capital of an arrondissement in the department of Sambre-et-Meuse.

DINAPOOR, in Hindustan, a town in the British district of Patna, within the jurisdiction of the Lieutenant-Governor of Bengal, and situate on the right or south back of the Ganges. It has a military cantonment belonging to the British, consisting of two handsome squares, built of brick, and capable of containing 1200 European soldiers, and the European officers of the native corps. There is also a capacious and handsome church. Pop. exclusive of the military, estimated at about 16,000. Distant W. of Patna 10 miles. Lat. 25. 37.; Long. 85. 7. (E. T.)

DINARIC ALPS. See ALPS.

DINDIGUL, a district in the south of India, situated between the 10th and 11th degrees of N. Lat. To the N. it has Coimbetoor and Kistnagherry; to the S. Travancore and Madura; on the E. the Polygar territory and Madura; and on the W. Travancore, Cochin, and Malabar. The principal rivers are the Noil and the Amravati; and the chief towns Dindigul, Balny, and Palapetty. This district was conquered by the Mysore government in 1757. It was taken possession of by the British in 1783, and subsequently restored to Tippoo Sultan. In 1792 it was again ceded to the British, and is now included in the collectorship of Madura. The capital is of the same name. It is a place of considerable consequence, and possesses a strong fortress situated on a rock. Its population, exclusive of the military, has been returned at 6550. Elevation above the sea, 700 feet. E. Long. 78. 5.; N. Lat. 10. 22. (E. T.)

DINDING, a small island in the Straits of Malacca, at the entrance of the river Pera, about twenty miles in circumference. E. Long. 100. 36; N. Lat. 4. 15.

DINDYMENE, a surname of Cybele; probably derived from Mount Dindymus in Phrygia.

DINGLE, a market-town of Ireland, country of Kerry, on the N. side of Dingle Bay, 8 miles E. of Dunmore Head. It carries on some trade in corn and butter with Liverpool, but the harbour is only fit for small vessels. In the seventeenth century Dingle carried on a considerable trade with Spain, and many of the houses are built in the Spanish fashion. The linen manufacture, formerly extensively carried on here, is now all but extinct. Pop. (1851) 3261.

DINGWALL, a royal burgh of Scotland, and capital of the county of Ross; 15 miles N.W. from Inverness, and 182 from Edinburgh. It lies in a low situation at the mouth of a glen opening into the north side of the Cromarty Frith, near the western extremity of that estuary. The town is rather neatly built, and consists of one main street, from which several smaller ones branch off. The town-house is a curious old building, with a spire and clock. The Established church is a plain edifice, on the north side of the town; and near it stands an obelisk, 57 feet in height, erected to the memory of the first Earl of Cromarty, who was buried here. The harbour was formerly some distance from the town; but in 1815–17 a canal was formed, by means of which vessels of considerable burden are brought to the immediate vicinity of the town. It is, however, a place of little or no trade. Near the harbour formerly stood the mansion of the powerful family of Ross; but of this princely structure only a few fragments remain. Dingwall was created a royal burgh by Alexander II.; and its charter was renewed by James IV. It is governed by a provost, two bailies, a dean of guild, treasurer, and ten councillors; and unites with Tain, Dornoch, Wick, Kirkwall, and Cromarty, in returning one member to the imperial parliament. Market-day, Friday. Pop. (1851) 1990.

DINKELSBUHL, a fortified town of Bavaria, and the capital of a bailiwick in the circle of Middle Franconia, on the Wernitz, 20 miles S.W. of Anspach. It was formerly a free imperial city, and now contains about 5500 inhabitants, engaged chiefly in the manufacture of woollen cloths, hats, stockings, and leather.

DINNER, the principal meal of the day. The word is derived from the French *disner*, which Du Cange derives from the barbarous Latin *disnare;* but Henry Stephens derives it from the Greek δειπνεῖν, and contends that it should be written *dipner*. Ménage deduces it from the Italian *desinare*, to dine; and that from the Latin *desinere*, to leave off work.

DINOTHERIUM (δεῖνος, *terrible;* θήριον, *a wild beast;*) a genus of extinct herbivorous animals of gigantic size. See GEOLOGY.

DIOCESE, the circuit or extent of the jurisdiction of a bishop. The word is formed from the Greek διοίκησις, *government, administration*, derived from διοικεω, which the ancient glossaries render *administro, moderor, ordino;* and hence διοίκησις τῆς πόλεως the *administration* or *government of a city*.

DIOCESE is also used in ancient authors for the province of a metropolitan.

Diocæsis was originally a civil government, or prefecture, composed of different provinces.

The first division of the empire into dioceses is ordinarily ascribed to Constantine, who distributed the whole Roman world into four, namely, the diocese of Italy, the diocese of Illyria, that of the East, and that of Africa. And yet long before the time of Constantine, Strabo, who wrote under Tiberius, takes notice (lib. xiii. p. 432) that the Romans had divided Asia into dioceses; and he complains of the confusion which such a division occasioned in geography, Asia being no longer divided by people, but by dioceses, each of which had a tribunal or court, where justice was administered. Constantine, therefore, was only the institutor of those large dioceses, which comprehended several metropolises and governments; the former dioceses only comprehending one jurisdiction or district, or the country which had resort to one judge, as appears from the above passage in Strabo, and also from two in Cicero (lib. iii. *epist. ad Famil.* 9, and lib. xiii. *ep.* 67).

Thus at first a province included different dioceses, and afterwards a diocese came to comprehend different provinces. In after times the Roman empire became divided into thirteen dioceses or prefectures; though, including Rome and the suburban regions, there were fourteen. These fourteen dioceses comprehended a hundred and twenty provinces; each province had a proconsul, who resided in the capital or metropolis; and each diocese of the empire had a consul, who presided in the principal city of the district.

On this civil constitution the ecclesiastical one was afterwards regulated; and each diocese had an ecclesiastical vicar or primate, who judged finally of all the concerns of the church within his territory. At present, however, diocese does not signify an assemblage of different provinces, but is limited to a single province under a metropolitan, or more commonly to the single jurisdiction of a bishop.

Brito observes that diocese is properly the territory and extent of a baptismal or parochial church; and hence various authors use the word to signify merely a parish. See PARISH.

DIOCLEIA, in *Antiquity*, a festival with gymnastic and other contests, celebrated during spring at Megara, in memory of an ancient Athenian hero Diocles, who died in battle in defence of a youth he loved.

DIOCLETIANUS, CAIUS VALERIUS JOVIUS (A.D. 245–313), Roman emperor, was born of obscure parents in Dalmatia. His reign lasted from A.D. 284 to 305. The rest of his life was spent in retirement at Salona. The era of Diocletian, or era of the martyrs, began August 29, 284. See ROMAN HISTORY.

DIODATI, GIOVANNI (1576–1649), a celebrated Protestant divine and biblical annotator, was born at Geneva, of an Italian family which had fled from Lucca to escape religious persecution. At the recommendation of Beza he was appointed professor of Hebrew when only twenty-one years of age. In 1608 he was appointed parish minister of Geneva, and in 1609 professor of theology. Along with Theodore Tronchin, he was deputed to attend the synod of Dort, and concurred in the condemnation of the Arminians. Besides numerous theological treatises on questions connected with the reformation, Diodati translated the Bible into Italian (1607); and afterwards into French (1644). He also wrote *Annotationes in Biblia*, which was translated into English in 1648; and translated Paul Sarpi's *History of the Council of Trent*, and Sir Edwin Sandys' *Account of the State of Religion in the West*.

DIODORUS SICULUS, a Greek historian, born at Agyrium in Sicily. Of his life we know nothing except what he himself has narrated, that, in prosecution of his historical researches, he undertook frequent and dangerous journeys, and studied Latin at Rome. His history occupied thirty years in writing, and was at last completed in forty. From internal evidence it is certain that it was written after the death of Julius Cæsar; but the passages which show him to have survived the alteration of the calendar by Augustus are generally regarded as spurious. His history, to which from its comprehensive plan he has given the title of *Bibliotheca*, is divided into three parts. The first treats of the mythic history of the Non-Hellenic, and afterwards of the Hellenic tribes; the second section ends with Alexander's death; and the third continues the history as far as the beginning of Cæsar's Gallic war. Of this extensive work there are still extant only the first five books, treating of the mythic history of the Egyptians, Assyrians, Æthiopians, and Greeks; and also from the 11th to the 20th book inclusive, beginning with the second Persian war, and ending with the history of the successors of Alexander, previously to the partition of the Macedonian empire. The rest exists only in fragments which have been collected by Photius. The faults of Diodorus arise principally from the gigantic nature of the undertaking, the cumbrous nature of the materials, and the awkward form of annals into which he has thrown his narrative. He has been at little pains to sift his materials, and hence frequent repetitions and contradictions may be found in the body of the work. As a critic, he seems to have been altogether ignorant of the ethical advantages of history, and shrinks from administering praise or blame to the persons whose history he writes. In the chronology of the strictly historical period he is occasionally inaccurate; and the poetical myths which take the place of the early history are related with all the gravity of historical detail. His narrative is without colouring, and monotonous; and his simple and clear diction, which stands intermediate between pure Attic and the colloquial Greek of his time, enables us to detect in the narrative the undigested fragments of the materials which he employed. The particulars, however, which he has handed down are valuable as enabling us in several points to rectify the errors of Livy. The best editions of Diodorus are Wesseling's, 2 vols., Amstel. 1745; that printed at Deux-Ponts, 11 vols., 1793–1801; Eichstadt's (to book xiv.) 2 vols.; Halle, 1802–4; and Dindorf's, 5 vols., Leipz. 1828–31.

DIOGENES, of Apollonia in Crete, a celebrated natural philosopher who flourished at Athens about 460 B.C. As the pupil of Anaximenes, and contemporary and friend of Anaxagoras, his speculations stand midway between the systems of these philosophers. With Anaximenes he regarded air as the single element of the world, and in this respect he fell short of the dualism of Anaxagoras; but according to him this primal principle existed in various modes, it was especially endowed with intelligence, and in this respect he advanced beyond the pure materialism of Anaximenes. From the identification of intelligence and air, of mind and nature, the next step was obvious, viz., their recognition as distinct independent principles. Of his

Diogenes. treatise on Cosmology, some fragments remain, which have been collected and edited by Panzerbeiter.

DIOGENES, the famous Cynic philosopher, was the son of Icesias, a money-changer of Sinope in Pontus. Having been detected in adulterating coin, his father and he were compelled to leave their native city. According to another account however, Icesias died in prison, and Diogenes fled to Athens with a single attendant. On his arrival in that city he dismissed his attendant with the piquant question, "If Manes could live without Diogenes, why not Diogenes without him?" and on the same principle he denuded himself of all superfluous dress, furniture, and even ideas. A wooden bowl, which, with his cloak and wallet, formed his only moveables, is said to have been immediately discarded when he saw a boy drinking water from the hollow of his hand. The fame of Antisthenes soon attracted him to Cynosarges, and the pertinacity with which, for the sake of wisdom, he not only endured the scoffs but volunteered to submit to the blows of the great teacher, soon procured him a favourable reception from the whole Cynical school. The favourite pupil, however, soon outstripped his master in the extravagancies of his life, and the pungent keenness of his sarcasms. That he took up his abode in a cask belonging to the temple of Cybele, is a circumstance liable to suspicion, from being more frequently alluded to by the satirists than by the biographers of Diogenes. That he used to inure himself to the vicissitudes of the weather by rolling himself in hot sand in summer, and in winter by embracing statues covered with snow, are facts resting on the authority of all the ancient historians. His numerous witty apothegms are preserved by Diogenes Laertius. After his voyage to Ægina, during which he fell into the hands of pirates, who sold him as a slave in Crete, the conduct of Diogenes appears in a much less ridiculous light. With characteristic boldness he proclaimed to his captors that he knew no trade except "to govern men," and wished to be sold "to a man that wanted a master." Such a purchaser he seems to have found in Xeniades, who took him to Corinth to superintend the education of his children. Here he spent the rest of his life, and is said to have reached an extreme old age. Here at the Isthmian games he taught the assembled concourse in the Kraneion; and hither he attracted a crowd of disciples when Antisthenes had ceased to tickle their ears in Cynosarges. Here, too, in all probability, his famous interview with Alexander took place, in which the only favour he had to beg of the prince was that he would not stand between him and the sun; when Alexander is said to have exclaimed, "If I were not Alexander I would be Diogenes." To Athens Diogenes seems never to have returned. Of his death, which is said to have taken place on the same day with that of Alexander the Great, there are various conflicting accounts. That he perished by the bite of a dog, or from the immoderate use of raw-flesh, or by his own hands, are all generally disbelieved. It is more probable that his death was calm and peaceful; and in spite of his desire to be thrown to the beasts of the field, he received from Xeniades an honourable interment. In the days of Pausanias the Corinthians pointed with pride to his grave; and on the isthmus there was a pillar erected to his memory, on which, as the self-chosen symbol of his life, there rested a dog of Parian marble. His connection with Lais, and the open indecencies of which he is said to have been guilty, have thrown a shade upon his character. The former incident is, however, it must be confessed, exceedingly improbable; and the latter charge was undoubtedly exaggerated, if it was not originated by the shameless excesses of the later Cynics.

It is difficult to give any systematic account of the philosophical opinions of Diogenes. His highest ethical principle was the exercise, or as he usually styled it the gymnastics of the soul, and in carrying out this idea in the family of Xeniades the most honourable part of his life was spent. With him virtue was merely negative, and its most prominent features were resolution and impassibility. With Plato his model state was based on a community of goods and wives. Even in antiquity his opinions seem to have been confounded with those of Diogenes of Apollonia, and works which were undoubtedly spurious were confidently attributed to him. For his relation to Socrates and to the later schools of philosophy, see CYNICISM.

Diogenes Laertius || Diomedes.

DIOGENES LAERTIUS, the biographer of the Greek philosophers, is supposed by some to have received his surname from the town of Laerte in Cilicia, and by others from the Roman family of the Laertii. Of the circumstances of his life we know nothing. The date at which he wrote—probably the reign of Septimius Severus—is known only from conjecture. His own opinions are equally uncertain. By some he was regarded as a Christian; but it seems more probable that he was an Epicurean. The work by which he is known professes to give an account of the lives and sayings of the Greek philosophers. Although it is at best an uncritical and unphilosophical compilation, its value, as giving us an insight into the private life of the Greek sages, justly led Montaigne to exclaim that he wished that instead of one Laertius there had been a dozen. In the commencement of the work he divides philosophers into the Ionic and Italic schools. The biographies of the former begin with Anaximander, and end with Clitomachus, Theophrastus, and Chrysippus; the latter begins with Pythagoras, and ends with Epicurus. The Socratic school, with its various branches, is classed with the Ionic; while the Eleatics and sceptics are treated under the Italic. The whole of the last book is devoted to Epicurus. From the statements of Burlæus, the text of Laertius seems to have been much fuller than that which we now possess; and hopes have been entertained of obtaining a more complete copy. The best modern edition is that of Hübner, Leipzig, 2 vols. 8vo, 1828–31.

DIOMEDES, the most valiant, after Achilles, of all the Greeks who took part in the Trojan war. He was the son of Tydeus (from whom he inherited his patronymic of Tydides) and Deïpyle, and succeeded Adrastus on the throne of Argos. According to the old traditions, Tydeus perished in the famous expedition of the Seven against Thebes, leaving his son an infant. Diomedes' first act on attaining the years of manhood, was to lead another expedition against that city, which he took, and amply avenged his father's death. When war was declared against Troy, Diomede, in company with Sthenelus and Euryalus, set sail with eighty ships to avenge the injuries of Menelaus. The numerous exploits of Diomede in the Trojan war are all recorded in the glowing verse of Homer in the *Iliad*. He fought with the bravest heroes of the Trojan army, Hector and Æneas, both of whom he put to flight. Even the gods who did battle on the side of Troy were encountered by him with the same reckless boldness which marked his engagements with ordinary mortals. Mars himself retired wounded before him from the field of battle; and even Venus did not escape the resistless impetuosity of his attack, when she ventured to mingle in the fight in defence of her favourite Trojans. In the games instituted by Achilles to commemorate the death of Patroclus, he gained the prize in the horse-race, and defeated the mighty Ajax in single combat.

In the hands of later writers the valour and warlike exploits of Diomede received various embellishments. He was the companion of Ulysses in persuading Philoctetes to join the camp; and, along with him, carried off the palladium. In returning home he was stranded off the coast of Lycia; and on his arrival at Argos he was either too indignant at the faithlessness of his wife to remain, or was expelled by the adulterers. According to one account, he retired for a while to Ætolia, where he died; according to another, he returned to Argos; and a third tradition represents that

he went to Corinth, and in attempting to return to his native city was wrecked on the coast of Italy, where he espoused the cause of the Trojans against Turnus. Hence several towns in the eastern part of Italy trace their origin to Diomede.

DION CASSIUS COCCEIANUS, the celebrated historian of Rome, was born at Nicæa in Bithynia, A.D. 155. His father's name was Cassius Apronianus, and by his mother's side he was the grandson of Dion Chrysostom, who also obtained the surname of Cocceianus. When a young man he accompanied his father to Cilicia, of which he had the administration; and on his father's death he went to Rome, where in the last year of the reign of Marcus Aurelius, or immediately after the death of that emperor, he was received into the senate. During the reign of Commodus, Dion continued to practise as an advocate at the Roman bar, and held the offices of ædile and quæstor. He was raised to the prætorship by Pertinax; but did not assume office till the reign of Septimius Severus, with whom he was for a long time on the most intimate footing. By Macrinus he was intrusted with the administration of Pergamus and Smyrna; and on his return to Rome he was raised to the consulship about A.D. 220. After this he obtained the proconsulship of Africa, and again on his return was sent as legate successively to Dalmatia and Pannonia. He was raised a second time to the consulship by Alexander Severus A.D. 229; but under pretext of suffering from a diseased foot, he soon after retired to Nicæa, where he died. The date of his death is unknown. Previous to writing his history Dion Cassius had inscribed to the emperor Severus an account of various dreams and prodigies which had presaged his elevation to the throne, and had also written a biography of the emperor Commodus, which was afterwards incorporated into his larger work. The History of Rome, which consisted of 80 books, and after the example of Livy was divided into decades, began with the landing of Æneas in Italy, and was continued as far as the opening of the reign of Alexander Severus. The first 24 books exist only in fragments; from the 36th to the 54th, the work is extant complete; from the 55th to the 60th, it is probably an abridgment; and besides these, parts of the 71st and 75th books have also been recovered. As a historian the diligence of Dion is undoubted, and the various important offices which he held under the emperors gave him valuable opportunities for historical investigation. Although more philosophical than the compilations of the mere annalist, his work is not remarkable for vigour of judgment or critical acumen. His style is far clearer than that of Thucydides, whom he took as his model; but his diction is full of Latinisms. His history was first published in a Latin translation by N. Leonicenus, Venice, 1526: the best modern edition is that of Sturz, Leipzig, 1824-43, which contains the *Excerpta Vaticana.* Varies other works, such as a *History of Persia*, *Enodia or Itineraries*, a *Life of Arrian*, *Getica*, and a *Work on the Emperor Trajan*, are attributed to Dion Cassius, but in all probability without foundation. The substance of his history is reproduced in the annals of Zonaras.

DION *Chrysostom* (*i.e.*, *Golden-mouthed*), was born at Prusa, in Bithynia, about the middle of the first century. He visited Egypt with his father at an early period of his life; and went to Rome during the reign of Domitian. Being implicated in a plot against the tyrant, Dion fled from the capital, and wandered about in Thrace, Mysia, Scythia, and the other countries of the Getæ, with only Plato's *Phaedon* and Demosthenes *On the Embassy* in his possession, till the accession of Nerva, when he was allowed to return. With Nerva and Trajan he continued on the most friendly footing. He retired to Prusa for a short time; but having been accused of peculation and treason, he returned to Rome, where he remained till his death. Eighty orations of his are extant entire, and there are fragments of about fifteen others. They are written in a lucid and elegant style, and treat mostly of political, ethical, and mythological subjects.

DION, of Syracuse, was the son of Hipparinus, and brother-in-law of Dionysius the Elder. In his youth he was an ardent admirer and diligent pupil of Plato, whom Dionysius had invited to Syracuse; and he used every effort to promote the ascendency of his master's maxims in the administration of the kingdom. His near relationship to the despot gave him great influence at court; and also enabled him to amass considerable wealth. Accordingly, on the accession of the younger Dionysius, the stern morality of the philosopher stood in marked contrast to the dissolute character of the prince. An antagonism thus silently sprung up between the two; and the proposal of Dion to invite Plato again to Syracuse was made the occasion of an open rupture. To counteract the influence of that distinguished philosopher, the enemies of Dion obtained the recal of the historian Philistus, who had already signalized himself as a faithful supporter of despotic power. This artful courtier quickly regained his ascendency over the mind of Dionysius, and was at length successful in procuring the banishment of Dion. The exiled philosopher retired to Athens, where he was at first permitted to enjoy his revenues in peace; but the intercessions of Plato served to exasperate the tyrant, and at length inflamed him to confiscate the property of Dion, and give his wife to another This last outrage roused Dion to seek the liberation of his country by force of arms. Assembling a small force at Zacynthus, he sailed to Sicily, and, in the absence of Dionysius, was received with demonstrations of joy. He succeeded in defeating the forces of the tyrant, but was himself soon after supplanted by the intrigues of Heraclides. Again he was banished; but the incompetency of the new leader soon led to his recal. He had, however, scarcely made himself master of Sicily when the people began to express their discontent with his tyrannical conduct, and he was assassinated by Caliphus, an Athenian who had accompanied him in his expedition.

DIONIS, PIERRE, one of the greatest surgeons of the eighteenth century, was born at Paris. During the reign of Louis XVI., he was appointed anatomical demonstrator in the Jardin des Plantes. His earliest publication is entitled *Anatomie de l'Homme, suivant la circulation du sang, et les nouvelles découvertes*, 8vo, 1690, and has been frequently reprinted. It was translated into the Tartar dialect by a Jesuit, for the use of Kang-hi, emperor of China. In another work, published in 1698, entitled *Dissertation Historique et Physique sur la Génération de l'Homme*, he supports the ovarian hypothesis. In 1707 he published a work on surgery, entitled *Cours d'Opérations de Chirurgerie*, 8vo, which was several times reprinted; and was afterwards edited with notes by Lafaye, in two vols. This treatise was long received as a standard book on the subject. He also wrote *Dissertation sur la Mort Subite*, 12mo, published in 1709, and a *Traité Générale des Accouchements*, 1718, 8vo. The last is little more than an abridgment of Mauriceau's work on the same subject. Dionis died at Paris Dec. 11, 1718.

DIONYSIA, in *Grecian Antiquity*, festivals in honour of Dionysus (Bacchus), sometimes called by the general name of *Orgia*, and by the Romans *Bacchanalia* and *Liberalia*. See BACCHANALIA, and BACCHUS.

DIONYSIUS, the Elder, tyrant of Syracuse, was born about B.C. 430. He began life as a clerk in a public office, and first took part in political affairs during the dissensions that followed the destruction of the Athenian expedition. He was wounded in the attempt of Hermocrates to seize upon Syracuse; and during the disasters inflicted by the Carthaginians who had invaded the island, he succeeded, along

with Philistus and Hipparinus, in procuring the deposition of the Sicilian generals, and was himself included in the number appointed in their stead. By intriguing with the inhabitants of Gela, which he had been sent to relieve, and spreading insinuations of treachery in regard to his colleagues, he was ultimately invested with the supreme command; and by the help of a large body-guard he soon made himself independent of the popular opinion. Pestilence having thinned the Carthaginian army, Dionysius, in spite of his ill success, found no difficulty in procuring peace (B.C. 605). In the stronghold of Ortygia he defied the machinations of his enemies, until, partly from defeats and partly from dissensions, the opposition died away. After a successful expedition against Naxos, Catana, and Leontini, his next efforts were directed against Carthage. (See CARTHAGE.) He also carried an expedition against Rhegium and its allied cities in Magna Græcia. In one campaign, in which he was joined by the Lucanians, he devastated the territories of Thurii, Croton, and Locri. After a protracted siege he took Rhegium B.C. 387, and sold the inhabitants as slaves. He joined the Illyrians in an unsuccessful attempt to plunder the temple of Delphi, and also pillaged the temple of Cære on the Etruscan coast. In the Peloponnesian war he espoused the side of the Spartans. Not content with his military renown, Dionysius aspired also to poetical glory. His poems were hissed at the Olympic games; but having gained a prize for tragic poetry at Athens, he was so elated that he engaged in a debauch which proved fatal, B.C. 367. His life was written by Philistus, but the work has unfortunately perished. See SYRACUSE.

DIONYSIUS, the Younger, ascended the throne of Syracuse at his father's death. He was driven from the kingdom by Dion, and fled to Locri; but during the commotions which followed the assassination of that leader, he managed to make himself master of Syracuse. On the arrival of Timoleon he was compelled to surrender and retire to Corinth, B.C. 343, where he spent the rest of his days in poverty.

DIONYSIUS, of Halicarnassus, was born about the middle of the first century B.C. His father's name was Alexander. From the introduction to his great work we learn that he went to Italy after the termination of the civil wars, and spent twenty-two years in preparing materials for his history, which is entitled *Archæologia*, and embraced the history of Rome from the mythical period to the beginning of the first Punic war. It was divided into twenty books; of which the first nine remain entire, the tenth and eleventh are nearly complete, and the remaining books only exist in fragments. In the first three books of Appian, and in the Camillus of Plutarch, much of Dionysius has undoubtedly been embodied. As a historian he is minute and painstaking; but his attempts to Grecianize the early history of Rome, that the Greeks might in some measure be reconciled to a foreign yoke, renders his accuracy more than suspicious. Dionysius was also the author of a treatise on rhetoric, which, with his criticisms on Thucydides, Lysias, Isocrates, Isæus, Dinarchus, Plato, and Demosthenes, have been preserved. The best editions of his works are those of Hudson and Reiske. The rhetorical works have been edited separately, by Gros and by Westermann.

DIONYSIUS, surnamed *Periegetes*, from his being the author of a περιήγησις τῆς γῆς, containing a description of the whole earth in hexameter verse, and written in a terse and elegant style. This work enjoyed a high degree of popularity in ancient times, and two translations or paraphrases of it were made by the Romans, one by Rufus Festus Avienus, and the other by the grammarian Priscian. The best edition of the original is that by Bernhardy, Leip. 1828. Great differences of opinion have been entertained as to the age and country of this Dionysius. All however are agreed in placing him in the time of the Roman emperors, and it seems highly probable that he flourished in the latter part of the third, or the beginning of the fourth century. Eustathius says that he was by descent a Libyan.

DIONYSIUS *the Areopagite*, according to Suidas, was an Athenian by birth, and eminent for his literary attainments. He studied first at Athens, and afterwards at Heliopolis in Egypt. While in the latter city, he beheld that remarkable eclipse of the sun, as he terms it, which took place at the death of Christ, and exclaimed to his friend Apollophanes, ἢ τὸ θεῖον πάσχει, ἢ τῷ πασχόντι συμπάσχει, "Either the Divinity suffers, or sympathises with some sufferer." He further details, that after Dionysius returned to Athens, he was admitted into the Areopagus; and, having embraced Christianity about A.D. 50, was constituted Bishop of Athens by the apostle Paul (Acts xvii. 34). Aristides, an Athenian philosopher, asserts that he suffered martyrdom—a fact generally admitted by historians; but the precise period of his death, whether under Domitian, Trajan, or Adrian, is not certain. A writer in later times attempted to personate the Areopagite, and contrived to pass his productions on the Christian world as of the apostolic age, thereby greatly influencing the spirit both of the Eastern and Western Churches. These writings consist of a book called *The Celestial Hierarchy;* another *Of the Ecclesiastical Hierarchy; A Treatise on the Divine Names;* another *Of Mystical Divinity;* and *Ten Epistles.* Different opinions have been held as to the real author of these productions. They were ascribed, at an early period, to Apollinaris, Bishop of Laodicea, in the fourth century—an opinion to which the learned Cave inclines, though he thinks that Apollinaris the son may have been the author. There have not been wanting instances in which supposititious works were fathered upon great names by disciples of the Apollinarian school. The resemblance between the *Areopagitica* and the writings of Proclus and Plotinus is so obvious as to afford great probability that the Pseudo-Dionysius did not write much earlier than the fifth century. The first uncontroverted occasion on which these supposititious writings are referred to, is in the conference between the Severians (a sect of Eutychians) and the Catholics, held in the Emperor Justinian's palace, A.D. 532, in which they are quoted by the heretical party. Maximus, and other writers in the following ages, refer to them frequently.

DIONYSUS. See BACCHUS.

DIOPHANTINE PROBLEMS, in *Mathematics*, certain questions relating to square and cube numbers, and right-angled triangles, the nature of which was determined by Diophantus, a mathematician of Alexandria, who is believed to have lived about the third century. The works of Diophantus were published with notes at Paris in 1621, by Bachet de Meziriac; and another edition appeared at Toulouse in 1670, with observations on every question by M. Fermat.

DIOPHANTUS, a celebrated mathematician of Alexandria, the reputed inventor of algebra. His era is uncertain. Some have placed him before Christ, and some after, in the reigns of Nero and the Antonines, but all with equal uncertainty. It is doubtful whether or not he be the same Diophantus who wrote the *Canon Astronomicus*, which Suidas says was commented on by the celebrated Hypatia, daughter of Theon of Alexandria. By the ancients, he was ranked with Pythagoras and Euclid in mathematical learning. From his epitaph in the Anthologia, Bachet has gleaned the following particulars concerning him, namely, that he was married when he was thirty-three years old, and had a son born five years thereafter; that this son died at the age of forty-two, and that his father did not survive him above four years. From this it appears that Diophantus lived to the age of eighty-four. See ALGEBRA.

DIOPTASE of *Haüy;* the rhombohedral emerald malachite of *Mohs.* This is a very rare mineral. It occurs in crystals of small dimensions, of a brilliant emerald-green

colour, disposed in limestone, and is only found in the Kirghese steppes, Siberia. See index to MINERALOGY.

DIOPTER, or DIOPTRA, the same with the index or alhidade of an astrolabe, or other similar instrument.

DIOPTRA was an instrument invented by Hipparchus, which served several purposes, as to level water courses, to take the height of towers or places at a distance, to determine the places, magnitudes, and distances of the planets, and the like.

DIOPTRICS, that part of optics which treats of the laws of refraction, and the effects which the refraction of light has in vision. See OPTICS.

DIORAMA (δια and ὁραμα, *view*), a mode of painting and of scenic exhibition, by which landscapes, and architectural and other objects are represented with the most perfect degree of optical illusion. The diorama is an imitation of the panorama, which was invented by Barker, an English artist, about 1796, and afterwards greatly improved in France. The first diorama was exhibited by MM. Daguerre and Bouton at Paris in 1822. The painting, which in the panorama is cylindrical, in the diorama is prepared on a plane surface. The management of the lights is a most important part of the exhibition. Various means are employed to enhance the illusion by optical combinations, such as transparencies, coloured glass, the light of torches, screens, &c.; and the differences of reflected and transmitted light afford an almost infinite variety of effects. By such means the transitions from day to night, and all the varied tints of sunshine and shadow, are imitated with a degree of illusion that is almost magical. The spectator is introduced into a chamber from which light is excluded, and sees through a large aperture or proscenium a view that is sometimes of great extent, and which is illuminated with all the effect of reality. The illusion is sometimes enhanced by several adjuncts, such as music, the singing of birds, the sound of rushing water, &c.

DIOSCORIDES, PEDACIUS or PEDANIUS, a celebrated physician, born in Cilicia, who flourished probably in the first century. He was author of a treatise on Materia Medica; and some smaller works on Toxicology are also attributed to him.

DIOSCURI (from Ζεύς, Διός Jupiter, and κοῦροι children), or sons of Jupiter, the common designation of the brothers Castor and Pollux. According to the myths, which however are very variously narrated by different authors, these twins were the children of Tyndareus, king of Sparta, and Leda. According to other accounts they were the children of Jupiter and Leda. In other versions of the same myth Leda is mentioned as having produced two eggs, from one of which sprang Castor and Clytemnestra, and from the other Pollux and Helen. The place is as variously given as the manner of their birth. Some authors give Amyclæ on the Eurotas, others Mount Taygetus in Laconia, others Thalamæ in Elis, others various islands of the Ægean. As soon as they grew up, they became distinguished for their skill in all athletic sports. Castor took under his especial patronage all equestrian exercises; while Pollux became equally renowned for his skill in boxing, of which he became, in after times, the tutelary god. It is in allusion to this fact that Horace (lib. i., ode 12) talks of the

> ———— pueros Ledæ
> Hunc equis, illum superare pugnis
> Nobilem.

The leading events in the lives of the Dioscuri are three in number. The first of these is their invasion of Attica, in which they rescued their sister Helen, who had been carried off by Theseus: the second, their share in the Argonautic expedition; and the third, their battle with the sons of Aphareus, in which Castor was killed. Pollux, finding his brother dead on the battle-field, implored Jupiter to be allowed to die along with him. Jupiter gave him his choice either to live as an immortal with the other gods, or to spend his time alternately, day by day, in Hades and in the upper world. According to other accounts the brothers were translated to heaven together after death, and ranked among the stars under the name of Gemini. The worship of the Dioscuri was very widely diffused throughout the ancient world; but especial honours were paid to them in Sparta and the Dorian colonies of Magna Græcia. It is in allusion to this fact that Mr Macaulay in his Lay of the battle of the Lake Regillus, in which they fought on the side of Rome, describes them as accounting for their appearance on that occasion—

> By many names men call us,
> In many homes we dwell;
> Well Samothracia knows us,
> Cyrene knows us well:
> Our house in gay Tarentum
> Is hung each morn with flowers;
> High o'er the masts of Syracuse
> Our marble portal towers;
> But by the proud Eurotas
> Is our dear native home,
> And for the right we come to fight
> Before the ranks of Rome.

They generally appear in the ancient classics as kindly, and disposed to help and protect all such as do them due honour. On this account their worship was carefully observed by travellers, whether on land or sea. Sailors were consequently very scrupulous in paying their homage to these deities both before and after a voyage; and even in the midst of a storm their prayers were believed to be not unheard by the Tyndaridæ. Hence Horace describes them as divinities—

> ———— quorum simul alba nautis
> Stella refulsit,
> Decidit saxis agitatus humor;
> Concidunt venti fugiuntque nubes
> Et simul quod sic voluere Ponto
> Unda recumbit.

Though their worship was perhaps most carefully observed among people of Dorian origin, they were held in no small veneration at Rome. It was the popular belief in that city from an early period, that the great day of the Regillus had been decided by their interposition. They had fought, it was said, armed and mounted, at the head of the legions of the commonwealth, and had afterwards carried the news of the victory with incredible speed to the city. The well in the forum at which they alighted was pointed out. Near the well rose their ancient temple. A great festival was kept in their honour on the Ides of Quintilis, believed to be the anniversary of that battle, and sumptuous sacrifices were offered to them at the public charge. It was further ordained that a grand muster and inspection of the equestrian body should be part of the ceremonial performed. All the knights, clad in purple, and crowned with olive, were to meet at a temple of Mars in the suburbs. Thence they were to ride in state to the forum, where the temple of the twins stood. This pageant was during several centuries considered as one of the most splendid sights of Rome. In the time of Dionysius the cavalcade consisted of 5000 horsemen, all persons of fair repute and independent fortune.

DIOSCURIA, in *Antiquity*, festivals in honour of the Dioscuri (Castor and Pollux), which were observed with great solemnity by the Cyreneans, and very generally throughout Greece, but especially by the Spartans, whose country was believed to have been honoured by the birth of these heroes. At Athens the Dioscuri were called *Anaktes*, and their festival *Anakeia*. Little is known regarding the ceremonies observed on these occasions.

DIOTA, an ancient Greek vessel for holding wine; so called because it had two *ears* or handles. See AMPHORA.

DIPHTHONG, in *Grammar*, a double vowel, or the mixture of two vowels pronounced together so as to make one syllable.

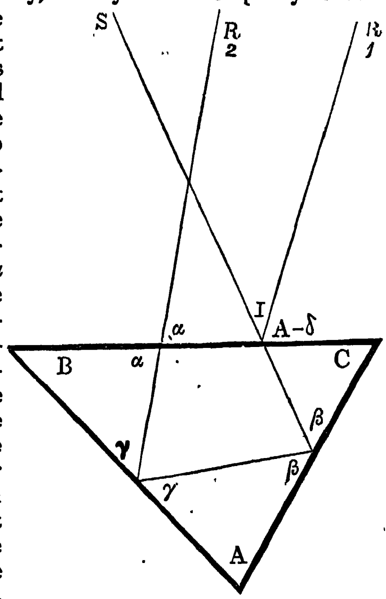
Dipleidoscope.

The Latins pronounced the two vowels in their diphthong *ae* or *æ*, and *oe* or *œ*, much as we do, only that the one was heard much weaker than the other, though the division was made with all the delicacy imaginable. Diphthongs with reference to sight, are distinguished from those with reference to sound. In the former, either the particular sound of each vowel is heard in the pronunciation; or the sound of one of them is drowned; or, lastly, a new sound, different from either, results from both; but the first of these only are real diphthongs, as being such both to the eye and ear. Diphthongs with regard to the ear are either formed of two vowels meeting in the same syllable, or of two vowels whose sounds are severally heard; or of three vowels in the same syllable, which only afford two sounds in the pronunciation.

English diphthongs, with regard to the eye and ear, are *ai, au, ea, ee, ei, oo, ou.* Improper English diphthongs, with regard to the eye only, are *aa, ae, eo, eu, ie, ei, oe, ue, ui.*

DIPLEIDOSCOPE, an instrument invented by Mr Bloxam, whose name has already been mentioned in the article on CLOCK AND WATCH WORK, for ascertaining the time of solar noon more exactly than can be done by a common sun-dial. It can also be used when the sun is covered with thin clouds, not thick enough to hide it, though sufficient to prevent it casting a distinct shadow. The name is compounded of διπλόος double, εἶδος an image, and σκοπέω I see, because in all positions except one it presents a double image of the sun. The instrument is to be fixed by a chronometer so that it may be in the position of showing the single image of the sun exactly at noon; and then at about a minute before noon the two images make their first contact, and at the same time after noon they completely separate, and the times of these contacts and also of the complete coincidence can be observed within two or three seconds. The following is the principle of the construction.

Let A B C be the rectangular section of a prism set so that a ray of the sun S I, and its reflected ray I R_1, lie in the plane perpendicular to the axis of the prism. It is not solid, but composed of three small glasses of which A B, A C, are mirrors, but B C is only a plain glass not silvered. Consequently, the ray S I will be partly reflected from B C in the direction I R_1, but part of it will pass through the glass and be reflected by the mirror A C on to A B, and there reflected again and sent through B C in the direction $a R_2$, making some angle a with B C. Suppose the angle of incidence, and therefore of first reflection to R_1, to be $A-\delta$ (A being the opposite angle of the prism), and the other angles as marked in the figure; and let us see what a the angle of the twice reflected ray will be.



Now, $\beta = \pi - (C + A - \delta)$, in the small triangle near C; therefore, in the one near A, $\gamma = \pi - (A + \beta) = C - \delta$; and in the triangle near B, $a = \pi - (B + C - \delta) = A + \delta$. And, therefore, the difference between the directions of the once reflected and the twice reflected rays is $2\,\delta$; and if the prism is so placed that the angle of incidence = the opposite angle of the prism at noon, the rays will then emerge parallel at noon, and the two images of the sun will be seen as one; as noon approaches, the images converge, and after noon diverge, with a velocity double that of the sun itself.

But the plane of incidence and reflection can only be perpendicular to the axis of the prism twice a-year. Still the same result will take place if it is once set properly. For suppose it to be set perpendicular to that plane at the equinox: then at midsummer the incident and reflected ray I R_1 will lie in planes making the angle ω (the obliquity of the ecliptic) with the equinoctial plane; but S I and I R_1 will be sections of two other planes parallel to the axis of the prism, in which the incident and reflected rays also lie. And, in like manner, the ray reflected from A C will lie in a plane at the angle ω below the equinoctial plane; and that reflected from A B to R_2 also; and the projections of these rays on the equinoctial plane will lie in the same direction as before; and, therefore, the twice reflected and the once reflected rays will emerge parallel, as before, when S I is in the plane of the meridian.

The prism is inclosed in a small solid brass box in the shape of an irregular pyramid about two inches high; and it is made so that it only requires fixing on a horizontal bed. They are only made by Mr Dent, as he is the proprietor of Mr Bloxam's patent. Instead of fixing them and so leaving them exposed to the air, he has lately adopted the plan of fixing a brass plate on the window-sill where the instrument is to stand, with a raised edge against which one side of the dipleidoscope is laid when it is first set by the chronometer, and afterwards whenever it is used. It is generally necessary either to smoke the front glass, or to look at it through a piece of smoked or coloured glass, which is supplied with it, as well as the necessary table of the times of first and last contact for every day in the year. Mr Dent has also lately made them to revolve upon an axis parallel to the earth's axis, and with a graduated hour circle, so that they may be used for any other hour as well as noon. But in this case the instrument can only be used (except at noon) for the latitude for which it is constructed, like a sun-dial, unless it has an adjustment for latitude also, as some of them have.

Some instrument of this kind ought to be kept by everybody who thinks it worth while to have a good clock, and yet has no other means of occasionally obtaining the real time, more accurately than from railway clocks, or public clocks of ordinary quality. For those who feel any difficulty about using the dipleidoscope, or who wish to be quite independent of the setting by a chronometer in the first instance, Mr Denison recommends, in his Treatise on Clocks, the following simple and independent construction of a sun-dial on a larger scale for noon only, which is quite sufficient for the occasional correction of a tolerably good clock:—Fix a thin plate of metal (protected against rust in any way you please) with a small hole in it, facing the south as nearly as you can, and inclined to the horizon at about 50° (not that the inclination is material), with the hole about nine inches above a stone slab set quite firm and level. Mark the point on the slab exactly under the hole by means of a pointed plumb-bob, and call it C. About 11 o'clock see where the bright spot falls on the slab, and call that A, and with radius C A draw as much of a circle as is likely to be wanted for the bright spot again to reach it about 1 o'clock. Mark the place where it does reach it a, and bisect the arc A a in M suppose, and draw a straight line C M, as long as the slab will hold, from C through M. That line is the meridian, and the spot will always fall upon it at solar noon. Before you mark the line strongly, it will be as well to take several observations of this kind at different times, before and after noon, and on different days:

and if their bisections agree in falling on the line CM you may be sure it is right. We have seen one of these dials with the gnomon only six inches high, and the time can be taken from it perhaps as accurately as from a dipleidoscope, and certainly with far less trouble.

In order that the bright spot may fall on the slab in winter, the distance of its northern edge from C must be rather more than four times the height of the hole above the slab. If this size is inconvenient, there may be a second hole made at half the height, the plate or gnomon not being finally fixed; then on any fine day in the summer half of the year, move the gnomon until the spot from this second hole also falls on the line CM at noon (it can be done in a moment), and there fix the gnomon. The lower spot will then always fall on the slab if it is made only half the size above mentioned, though in winter the upper one will fall beyond it. It is best to make the slab a light colour, and an equation-table may as well be cut upon it. (E. B. D.)

DIPLOMA (Greek, from διπλόος, *double*), originally denoted any charter, letter, or other composition written on paper or parchment, and folded. In its modern acceptation it denotes an instrument or letter, duly signed, which confers some privilege, honour, or authority. Such are the diplomas given to graduates of colleges; to clergymen who are licensed to exercise the ministerial function; to physicians and surgeons who are licensed to practise their professions; to agents authorized to transact business for their principals, &c. See DIPLOMATICS.

DIPLOMACY

Is the art of conducting the intercourse of nations with each other. The word obviously owes its origin to the source subsequently explained in the article DIPLOMATICS. It is singular that a term of so much practical importance in politics and history should be so recent in its adoption, that it is not to be found in Johnson's dictionary. There has indeed ever been a reluctance in the English nature to acknowledge the art of transacting international business, as a pursuit worthy of a British statesman, or as one entitling its adepts to honourable fame. It is popularly looked on as the art of carrying into the business of nations a morality condemned in the intercourse of men with each other, and as a means of employing subtlety where force is insufficient to accomplish some statesman's object. Hence the term has been colloquially used to express a modified degree of cunning; and conduct which is wily and subtle, without being directly false or fraudulent, is styled "diplomatic." The subject has been usually treated under the head of the Law of nations, or as it is now more properly termed International law. But a little examination will show that diplomacy, though closely associated with international law, is a separate sphere of intellectual exertion. The diplomatist undoubtedly requires to be acquainted with international law, and to observe its general injunctions. He often finds it necessary to appeal to the rules, or supposed rules, of that code; but it would be a confusion of terms to count him an officer engaged in the execution of international law. He has to accomplish objects which are not achievable through any law real or fictitious, but are achieved solely through the art of diplomacy. The close connection of the two systems with each other, and at the same time the distinction of the sphere occupied by each, may be illustrated by an example. In the year 1841, some slaves, the property of citizens of the United States, seized the vessel in which they were embarked, and proceeded with it to a British settlement, where on landing they asserted their freedom according to British law. A question thence arose, in that department of international law which is sometimes called the conflict of laws. On the American side it was maintained, that all civilized nations admit the sacredness of private property; and that when courts of law have to deal with the citizens of another state, they enforce among them that state's adjustment of the laws of property. Hence the slaves, being, it was said, property by American law, must be held so by the judges in the English colony when American citizens were the parties. On the other hand it was maintained, that the civilized states, while they uphold property, should not enforce the political laws of their neighbours, by persecuting refugees fleeing before a dominant influence; and it was observed that British political offenders have always been hospitably received in America. This view was adopted, and the British courts holding the question to be political, or between man and man, not a mere affair of property, refused to ratify the demands of the slave-owners. The case of the Creole, as this affair was called, was a question of international law, in which British judges had to decide how far their own law permitted them to give effect to a foreign law. Had the American government, from a preponderance of power in the southern states, or from any other cause, thought fit to demand that Britain should make reparation for the effect of this decision, or should adjust her laws so as to decide otherwise in future—then the question would have become one of diplomacy. Questions in which private rights and obligations are concerned, are a perpetual source of diplomatic exertion. In this country, and to some extent in the other states called the great powers, the administration of justice is pursued on rules so absolute, that there is no chance of their being relinquished to favour a friendly or to injure a hostile nation. Of this there was a remarkable instance in the late war, when British judges would not admit the orders in council of 1809 to be an effectual blockade, so as to justify a forfeiture of neutral vessels for their infringement. Undoubtedly, however, in those states where the power of the law is not so independent and supreme, the decisions of the courts in questions with foreigners will often be swayed by the strength or feebleness of the nation to which these belong, or by the question, whether its representatives will or will not give them support. In this manner diplomacy and international law are often mixed up with each other; and so lately as the year 1850 it became a question whether or not a European war should arise out of the circumstance, that the petty kingdom of Greece refused to make good some pecuniary claims by British subjects, the chief of whom, though he was legally entitled to that designation, was by birth and origin an Italian Jew. It was well known that Greece, in refusing these demands, was instigated by Russia. It was important to the maintenance of British diplomatic influence in Europe, that the petty states should be taught the fallacy of such a dependence, and the claims were enforced by the presence of a fleet, and a threat of bombardment, not so much to terrify Greece, as to show her that Britain would not permit encroachments by Russia on the rights of her subjects. From such instances it will be seen that diplomacy, besides the larger operations connected with great treaties or alliances, keeps a vigilant eye on the ordinary details of international law, for the purpose of seeing that it is equitably administered. In this sense the diplomatist is like a law-agent, whose duty it is to see that his client receives justice at the hands of other nations under this code.

Diplomacy, as a science, has arisen out of the development of the European powers, and their rise on the ruins of the Roman empire. As a uniform system, following principles nearly as well established as those of many codes of law, it

exists solely among the European powers, partly embracing those nations, such as Turkey and Persia, which have been brought into close association with them. The difficulty, however, of getting these Eastern states to understand and obey the laws of diplomacy, and submit to its restraints, has ever been an object of anxious comment to Wickefort and the other systematic writers on diplomacy. To submit to be bound in the moment of power by a theoretical system not enforced by the strong hand of any judge, spiritual or temporal, is not consistent with the Oriental mind; and the great civilized powers, in dealing with the Eastern states, as in their intercourse with barbarous tribes, have relied on their own strength, exercised with cruelty or with mildness as the case might be. Alliances and leagues, declarations of war and treaties of peace, have taken place, it is true, among those states, but it would be a historical absurdity to suppose diplomatic relations connecting together China, Burmah, and Japan, as they connect Britain, France, Holland, and Prussia.

In the same manner the ancient world had its treaties and leagues, but no systematic diplomatic relations. The pretensions of Rome during the empire, indeed, superseded every kind of international engagement, since she would permit of no relation between the empire and any other state, save that of predominance on her part and subjection on the other. Yet it is evidently from this system of centralization that the diplomatic relations of the European states arose. Freed from the temporal jurisdiction of the empire, and no longer mere dependencies, the European states were still subject in a modified shape to an influence radiating from the old centre of imperial authority. The Bishop of Rome, in claiming a spiritual authority at least co-extensive with the geographical area of the temporal authority of the departed emperors of Rome, created a sanction, though an imperfect one, for the execution of justice among nations, and acted in some measure as a controlling influence over their diplomatic operations. A memorable instance of the influence of the Pope is found in the relations between King John of England and Philip of France. The semi-judicial authority of the court of Rome was cited in support of the English conquest of Ireland, and was appealed to by both parties in the Scottish war of independence. Little as the papal authority was respected by even the most Catholic monarchs when they were at the head of large and well-found armies, yet in matters of dubious equilibrium the authority of the Pope had some weight; and as his was a power not limited to any particular state or cluster of states, but ever present throughout all the transactions of Christian realms with each other, it had, beyond doubt, an influence gradual and continuous, in giving modern diplomacy the amount of specific character which it had obtained at the period of the Reformation. Thus a kind of traditional uniformity of practice has provided a partial substitute for that supreme power always necessary for the enforcement of what are termed laws. Under the heads Balance of Power, and the Law of Nations, the evils arising from the absence of a supreme power to judge between states, as the courts of law decide questions between individual citizens, will be found amply discussed. It suffices here to say, that much of the deficiency is filled up by the fortunate train of events which have created, throughout the civilized world, a traditional system of diplomatic practice. On great occasions, when sovereigns have made up their minds to the commission of high national crimes, as for instance, the partition of Poland, the violation of the Baden territory for the capture of the Duke of Enghien, or the project in which Russia so fallaciously expected the countenance of the British ambassador for a partition of Turkey, the rules of diplomacy have been violated. But there is always a certain shame attached to such violations —a certain coercive influence in the uniform practice of diplomatic officers, which serves to bind powers the most tyrannical and fraudulent, unless when they are influenced by strong temptations; and the system altogether is thus a powerful protection to the smaller states, and an instrument for the conservation of peace and justice throughout the world.

It is hence generally in weak states that the science of diplomacy has flourished. The politicians of the Italian republics, among whom the name of Machiavelli stands supreme, have been counted the earliest adepts in the science; and it was the practice of the greater states to choose their diplomatists from Italy on account of the peculiar aptitude of the educated Italians for the subtleties of the profession, just as private employers selected clerks in Geneva and valets from the Swiss. The nature of the skill thus supposed to be acquired will readily be understood by reflecting, that a small state standing alone against a great power, and bluntly putting it at defiance so as to bring on an immediate trial of strength, would be speedily lost; and that it has been held the special and peculiar function of the diplomatic representatives of such feeble governments, to act on skilful calculations of the influence of the combined interests of nations great and small—as the chess-player, when making a move, calculates on its influence over the relation towards each other of the symbols of various degrees with which he plays his game.

The representatives of great nations, following up the traditions of the science of diplomacy, have often sought by similar acts to do what they considered their duty to their country by taking advantage of every opportunity of aggrandizing it. But modern political philosophy and morality teach us that this is not the manner in which great nations are to be supported or aggrandized, and that for their diplomatic servants there is spread out a far nobler field of exertion. It is founded on the consciousness that the real power of states must come from within—from the sound condition of the people, physically, industrially, and morally—from well-poised political institutions and good government. If these are absent no diplomatic skill can make up for them; if they be present it cannot enhance the real power of the state which possesses them. But to the diplomatic representatives of states both powerful and honest a function of a higher character still than mere national aggrandizement belongs, in the capacity, by able, temperate, and honourable negotiation to keep feeble states from being crushed by their potent neighbours, to preserve peace in the world so long as it can honourably be preserved, and to see generally that international justice is observed among mankind. The true functions of the great powers are in some measure embodied in the renowned lines in which Virgil told Rome the duties she was not to fulfil:

> "Tu regere imperio populos, Romane, memento;
> Hæ tibi erunt artes; pacisque imponere morem,
> Parcere subjectis et debellare superbos."

The historical events, and the industrial and commercial progress which have during the past hundred years so aggrandized the power of Britain among European nations, have, in this view of the uses of our diplomacy, become a great boon to the smaller states, and even to the citizens of the greater. The parliamentary responsibility, and the perpetual public scrutiny and discussion to which the acts of our statesmen are subjected, are not only checks on our own diplomatic acts, but on those of every other civilized state. It was a boast attributed to one of the great fabricators of British diplomacy, the elder Pitt, that not a gun should be fired throughout the world without Britain knowing why. If Britain could make good this boast, it would extend in some measure to mankind at large the blessings enjoyed at home from living under a responsible government. As it is even at present, the continuous liability of having whatever he does called before parliament and the public, must be an ever present and influencing motive

with every British diplomatist. Hence he not only dare not countenance any act of national rapacity, tyranny, or fraud, but he is, as the representative of a nation which has great power and no secrets, a check upon the diplomatic honesty of all the world.

Of the advantages afforded to mankind at large by the public responsibility of British diplomatists, a memorable instance is afforded by the renowned Holy Alliance. It was contracted on the 26th of September 1815 by three monarchs who personally signed the document—the emperors of Russia and Austria and the king of Prussia. This treaty, announcing the determination of those who acceded to it to act as Christian princes on the precepts of the Gospel, and to follow the rules of justice, charity, and peace, is known to have been a combination among the despotic monarchs to aid each other in the maintenance of arbitrary power, and the suppression by them collectively of any efforts in favour of constitutional principles occurring in the dominions of any member of the league. Every considerable European monarchy finally joined the combination with the signal exception of Great Britain. The crown was then represented by the Prince Regent, afterwards George IV. Though it was known that few monarchs had more sympathy with the objects of the league, he was obliged to state that "The forms of the British constitution which he was called upon to maintain, in the name and in the place of the king his father, prevented him from acceding to it in the form in which it was laid before him." Governed as Britain for some subsequent years was by members of the political party whose sympathies with the Holy Allies were the strongest, yet their efforts were, by the necessity of their position as British ministers, directed to the effective counteraction of the great plot of the despotic powers. More lately, in connection with the source of the war which Britain and France are now (1854) pursuing against Russia, there was an instance of the effects of British responsibility and publicity which will teach the rapacious governments in future not to include in their projects the chance of securing British co-operation. When the czar of Russia was maturing his projects for the seizure of Constantinople and European Turkey—as his predecessors had seized on Poland, Finland, and the Crimea—he tried to gain the co-operation of the British ambassador, Sir Hamilton Seymour, by seductive offers of British aggrandizement in the East. Sir Hamilton, feeling the importance of the proffers so made to him, and his high responsibility to the British parliament, communicated to his own government all the details; which, being then at the command of parliament, were published to the world, and were received as a signal instance of imperial treachery.

The aggressive projects to which these revelations referred have produced a revolution in European diplomatic relations calculated to influence the condition of the world for ages to come. It had become a sort of political superstition that France and Britain are natural enemies. This arose pretty obviously out of those claims which the peculiar rules of succession attributed to the Salic law had given to English monarchs, on the throne of France. A continuous succession of untoward events widened the hostile schism thus created; and although on several occasions there has been a popular sympathy between the two countries, it can hardly be said that France and England have had an opportunity of showing sincere and cordial co-operation in the pursuit of a common policy from the period of the Crusades down to the spring of 1854, when in the Baltic and the Euxine they united their forces against Russia. With Scotland France had much diplomatic intercourse down to the union of the crowns, and she occasionally made tempting offers to Scotland as well as to Ireland while they had separate legislatures. These were efforts directed to the creation of a diversion against England, and they pointed to diplomatic relations entirely the reverse of the present connection between Britain and France. If that connection should prove permanent, it cannot fail, as has been here before indicated, to create a signal revolution in European diplomacy; and, onerous as its inauguration has been in a hard contest with Russia, there can only be anticipated from the cordial co-operation of the two most powerful states of Europe the most benign influence over the destinies of the world.

In contrast to the old opinions which attributed the power and prosperity of nations to diplomatic ability, overlooking the substantial sources of material progress, a political sect has lately appeared who denounce the diplomatic system as foolish or wicked, and proclaim the doctrine of non-intervention in the affairs of other nations. It is practically clear, however, that whatever degree of perfection the world may reach in time, the first great power which avows this opinion will become the immediate victim of its rivals; and thus, should Britain withdraw herself from the diplomacy of Europe, the despotic states would soon become strong enough to shut up the commerce of the world, and cast the world two centuries back in civilization. There is reason, indeed, to believe that the late aggressions of Russia were founded on a supposition that the doctrines of this kind so often proclaimed by enthusiasts, had really taken such deep root in the public mind, that Britain would never go to war unless for her own defence—a supposition which turned out to be signally erroneous.

There is indeed a species of intervention from which British diplomacy has been generally but not always free, which cannot be sufficiently condemned. It is that which endeavours to dispose of a resisting people, by compelling them to belong to this or that state, to adopt some particular form of government, or to accept some dynasty as its rulers. For nearly a century after the revolution of 1688, the existence of the direct descendants of the exiled house of Stewart enabled France and the other European powers to menace Britain from time to time with the prospect of a civil war, creating within the country a diversion in favour of hostile efforts from without. On the outbreak of the French revolution, the despotic European states, exulting in the success of the partition of Poland, combined for the purpose of forcing back the Bourbons on their old throne, or partitioning France; and in this project they were joined, to her shame and loss, by Britain. The result was a miserable chastisement of national presumption, since the new republic, its spirit rising to the emergency, drove its enemies away on every side, and entering the despotic states, propagated and enforced republicanism with reactionary fanaticism. In the revolutions which have overtaken France in later times, the British government has acknowledged whatever power the French have chosen to submit to for the time being; but it is probable that the despotic powers of the Continent are awaiting the moment to strike a blow for that legitimacy which it is so much their personal interest to preserve.

The free-trade policy lately adopted by Britain, will not only remove many causes for interference with other nations, but must have the effect of generally simplifying our diplomacy by the removal of one of its most troublesome departments. Among the many advantages which it was deemed within the power of able diplomacy to achieve, successful trade was one of the most important; and a multitude of treaties for accomplishing reciprocity of trading privileges remain to attest the earnest labour with which such projects were carried out, and to perplex the historical inquirer. Every advantage on one side was supposed to be acquired by a loss on the other; and, as it is the duty of a diplomatist as of a soldier to make the enemy suffer, it may easily be imagined how much diplomatic exertion these illusory trading negotiations have caused. The belief of

the free trader is, that for whatever a nation sells it must buy; for whatever it exports it must import. This is the reciprocity of the natural laws of trade, which requires neither treaties nor battles to enforce it. Few nations in possession of anything worth acquiring refuse to sell; and if diplomatic skill shall ever be called on to help our trade, it will not be in the arrangement of reciprocity treaties, but in preventing the interference of arbitrary powers with the freedom of trading populations.

It is perhaps scarcely necessary to mention that the source of the diplomatic organization in any nation is its supreme power; but it is useful to keep in view, that, for the rapid movements of this department of politics, nations the most jealous of their constitutional rights have been obliged to place at least provisional power in the hands of individual rulers. Thus in Britain the Sovereign, independently of parliament, has technically the power to make treaties and to declare peace and war; and an authority not much less extensive is committed to the President of the United States. The guidance of a great state's relations with foreign countries is generally committed to one department of the government—with us it is the function of the foreign secretary. How far he is bound to consult his colleagues of the cabinet in his intercourse with foreign states, has, even within the last few years, been matter of acrimonious discussion. The various representatives of the government at foreign courts, though the dignified character of their missions sometimes gives them a rank much higher than that of their instructor, must obey the directions of the foreign minister. In the negotiation of treaties there is an old-standing dispute among publicists, how far nations can be bound if their ambassadors exceed the instructions given to them, which are generally kept secret. When, therefore, an important international act, such as a treaty, is undertaken, there are many sanctions and ceremonials to be accomplished before it is held to be completed. While matters are in a vague condition, many briefly expressed fundamental suggestions will have passed among the negotiators in the form of notes. When the matter becomes more ripe for adjustment, it assumes the shape of a protocol, or draft of the conditions. The ambassadors, when all is adjusted, sign the articles of the treaty; but still it is generally deemed essential that the several governments should ratify it, or, admitting that their representatives have not exceeded their instructions, engage to fulfil the bargain they have made. In this country, whenever treaties affect the private rights of the citizen, they must be ratified by act of parliament. The trade-reciprocity treaties were generally of this class. Of late, arrangements with France and the United States for the mutual apprehension of fugitive offenders have been so ratified by parliament; and in 1852 an act was passed for carrying into effect arrangements with foreign powers for the mutual apprehension of deserters from merchant ships. In addition to notes and substantive treaties, the most important documents in diplomacy may be considered the manifestos, in which, paying homage to public opinion and the established rules of diplomacy, governments profess to justify their conduct. When any vile act of oppression or injustice is perpetrated, it is generally followed by an able manifesto, and the ingenuity of the accomplished diplomatist is taxed to make the deed appear just, rational, and necessary.

To know what nations ought to be admitted to co-operate in negotiations, and which should be excluded, is one of the most important objects of diplomatic skill. Thus, when in 1840 the treaty of London united the four powers, Britain, Austria, Prussia, and Russia, in a union to compel the Pasha of Egypt to submit to the Sultan, the absence of France as a party to the treaty nearly caused a European war. While in secondary questions there is generally a mere correspondence between the representatives of two or more powers, on great occasions, when an opportunity has arisen for settling the organization of the civilized world, large congresses or conferences have been held like international parliaments. The latest and the most solemn of these was the renowned congress of Vienna, interrupted by the Hundred Days' reign of Napoleon. Much as the diplomacy of this assemblage has been criticised, yet no one can fail to remark, as a testimony to the general success of its adjustments, that while there have been revolutions and separate contests among European nations—accompanied by severe wars connected with our own Indian empire, and the colonial efforts of France—yet nothing has occurred seriously to affect the general relation to each other of the European powers, between the treaty of Vienna and the Russian war.

The nature and functions of the large body of officers who chiefly conduct the diplomacy of the world having been described under the word AMBASSADOR, it only remains to notice the incidental circumstance, that custom has for some time established the French language as the language of diplomacy. In the sixteenth, and during a great part of the seventeenth century, the Latin was employed. In Ludlow's Memoirs there is, under the year 1656, a curious notice to the effect that the Swedish ambassador "complained of the delays in his business, and that when he desired to have the articles of this treaty put into Latin according to the custom of treaties, that it was fourteen days they made him stay for that translation; and sent it to *one Mr Milton, a blind man*, to put them into Latin, who, he said, must use an amanuensis to read it to him, and that amanuensis might publish the matter of the articles as he pleased, and that it seemed strange to him there should be none but a blind man capable of putting a few articles into Latin." In turning over the pages of the great collection of Treaties by Dumont and Rousset, one may observe how gradually, during the ascendency of Richelieu, and the subsequent reign of Louis XIV., the use of the French language radiates from the immediate diplomatic transactions of France over those of Europe at large. Probably its propagation was originally connected with the visions of that universal French empire to which Louis XIV. seemed to be marching before he encountered the combinations of William of Orange. At the present day it can only be pronounced a fortunate thing that diplomatists have agreed to use one language, and that the best adapted for their peculiar functions. (J. H. B.)

DIPLOMATICS, the science of diplomas, or of ancient literary monuments, public documents, and the like. It does not, however, nor can it absolutely extend its researches to antiquity, but is chiefly confined to the middle ages and subsequent times. For although the ancients were accustomed to reduce their contracts and treaties into writing, yet they engraved them on tablets of brass, copper, stone, or wood; and all that in the earlier ages were not traced on metal or stone have perished.

The word *diploma* signifies properly a letter or epistle which is folded in the middle, and which consequently is not open. But in more modern times the title has been given to all ancient epistles, letters, literary monuments, and public documents, and to all those pieces of writing which the ancients called *Syngrapha*, *Chirographa*, *Codicilli*, and the like. In the middle ages, and in the diplomas themselves, these writings are called *Litteræ*, *Præcepta*, *Placita*, *Chartæ indiculæ*, *Sigilla*, and *Bullæ*; as also *Panchartæ*, *Pantochartæ*, *Tractoriæ*, *Descriptiones*, and so forth. The originals of these pieces are named *Exemplaria* or *Autographa*, *Chartæ authenticæ*, *Originalia*, &c.; and the copies, *Apographa*, *Copiæ*, *Particulæ*, and so on. The collections

which have been made of them are called *Chartaria* and *Chartulia*. The place where these papers and documents were kept the ancients named *Scrinia*, *Tabularium*, or *Ærarium*, words which were derived from the tablets of wood and brass; and, according to the Greek idiom, *Archeium* or *Archivum*.

The time is not precisely known when our modern paper was invented, and when people began to make use of quills in writing instead of reeds. The ink of the ancients was made of soot; and sometimes also they wrote with red ink made of vermilion, or in letters of gold on purple or violet parchment. It is not difficult for those who apply themselves to this study, to distinguish the parchment as well as the ink of the ancients from that of the moderns; but that which best distinguishes the original from the counterfeit is the writing or character itself, which is so different in different centuries, that we may tell with certainty, within about forty or fifty years, when any diploma was written. There are two works which furnish the clearest lights on this matter, and which may serve as sure guides in the judgments we may have occasion to form as to what are called *ancient diplomas*. The one is the celebrated treatise on Diplomatics by Mabillon, with a supplement by Maffei; and the other the first volume of the *Chronicon Gotvicense*. We there find specimens of all the characters, the flourishes, and different methods of writing, of every age. Besides several other works on diplomatics, Gatterer and Schöneman, in more recent times, have treated the science in the most systematic manner.

All the diplomas are written in Latin, and consequently the letters and characters have a resemblance to each other; but there are certain strokes of the pen which distinguish not only the ages, but also the different nations, as the writings of the Lombards, French, Saxons, and so on. The letters in the diplomas also are usually longer and less decided than those of manuscripts. There has also been introduced a kind of court hand, of a very disproportionate length, and the letters of which are called *exiles litteræ crispæ, ac protractiores*. The first line of the diploma, the signature of the sovereign, that of the chancellor, notary, &c., are usually written in this character.

The signature of a diploma consists either of the sign of the cross, or of a monogram or cipher composed of the letters of the names of the persons who subscribed it. The initial letters of the name, and sometimes also the titles, were placed about this cross. By degrees the custom changed, and other marks were invented, as, for example, the sign of Charlemagne, which was thus written:—

R
K—A/V—S
L

Sometimes also were added the dates and epoch of the signature, the feasts of the church, the days of the calendar, &c. The gradual corruption of the Latin language; the style and orthography of each age, as well as their different titles and forms; the abbreviations, accentuation, and punctuation, and the various methods of writing the diphthongs; all these matters united form so many characters by which the authenticity of an ancient diploma may be known.

The seal annexed to a diploma was anciently of white wax, and was skilfully imprinted on the parchment itself. It was afterwards pendant from the paper, and inclosed in a box or case, which was called *bulla*. There are also some which have been stamped on metal, and even on pure gold. When a diploma bears all the characters which are requisite to the time and place where it is supposed to have been written, its authenticity is not to be doubted: but at the same time we cannot examine these too scrupulously, since the monks and priests were very expert in making counterfeits, and the more so as they enjoyed the confidence of princes and statesmen, and were even sometimes in possession of their rings or seals.

With regard to manuscripts which were written before the invention of printing, it is necessary to know their nature, their essential qualities, and matter; to be able to read them freely, and without error; to judge of their antiquity by those characters which we have just mentioned with reference to the diplomas; and to render them of use in the sciences. As there are scarcely any of the ancient codes now remaining written on the Egyptian paper, or on wood, ivory, &c., we have only to consider those which are written on parchment or vellum (*membraneos*), and such as are written on our paper (*chartaceos*). The former of these are in most esteem. With regard to the character, these codices are written either in square and capital letters, or in half square or round and small letters. Those of the first kind are the most ancient. There are no intervals between the words, no letters different from the others at the beginning of any word, no points, nor any other distinction. The codices which are written in half square letters resemble those we have in Gothic characters, as well for the age as the form of the letters. Such as are written in round letters are not so ancient as the former, and do not go higher than the ninth or tenth century. These have spaces between the words, and some punctuation; but they are not so well written as the preceding, and are frequently disfigured with comments. The codices are divided, according to the country, into Lombard, Italian, Gaelic, Franco-Gaelic, Saxon, Anglo-Saxon, and so forth.

In the ancient Greek books the periods of a discourse are frequently terminated, instead of all other divisions, by lines, and these divisions were called, in Latin, *versus, a vertendo*; for which reason these lines are still more properly named *versus* than *lineæ*. At the end of a work the number of verses of which it consisted was put down, in order that the copies might be more easily collated; and it is in this sense that we are to understand Tribonius when he says that the Pandects contain 150,000 *pæne versuum*. These codices were likewise *vel probæ vel deterioris notæ*, more or less perfect, not only with regard to the calligraphy or beauty of the character, but also with reference to the correctness of the text.

It is likewise necessary to observe, in ancient codices, the abbreviations used in different centuries. Thus, for example, A. C. D. signifies Aulus Caius Decimus; Ap. Cn. Appius Cneius; Aug. Imp. Augustus Imperator. The characters which are called *notæ* are such as are not to be found in the alphabet; but which, notwithstanding, signify certain words. Lastly, the learned divide all the ancient codices into *codices minus raros, rariores, editos, et anecdotos*. The critical art is here indispensably necessary; its researches, moreover, have no bounds, and the more as the use of it augments every day, by the discoveries which are made in languages, and by the increase of erudition. Much learned and valuable information on all these matters is to be found in the work entitled *Nouveau Traité de Diplomatique, par deux Religieux de la Congrégation de Saint Maur*, 6 tom. 4to, Paris, 1750–1765.

DIPPEL'S OIL, a highly empyreumatic oil obtained by the destructive distillation of bone.

DIPPING, among miners, the interruption of a vein of ore or stratum. See Mining.

Dipping *Needle*, a magnetic needle that dips or inclines to the earth; an instrument for ascertaining the amount of the magnetic inclination at the different points of the earth's surface. This fact was first observed by one Robert Norman, an Englishman, and a maker of compasses for mariners, about the year 1576, who finding that he was always obliged to counterbalance that end which turns to the north by a bit of wax or such other substance, though the balance had been ever so exact before, published an account of his dis-

covery as a matter of importance. The subject was instantly attended to; and instruments were not only contrived for ascertaining the quantity of the dip, but various speculations were formed concerning the cause of so surprising a phenomenon.

The general phenomena of the dipping needle are, that in the equatorial regions it remains in a horizontal position, but as we recede from the equator towards either pole it dips; the north end if we go northwards, and the south end if we proceed southwards; and the further north or south we go, the greater is the inclination. Its inclination is likewise found to vary very considerably at different times in different places of the earth. See MAGNETISM.

DIPSAS, a serpent whose bite produces a mortal thirst; and hence its name *dipsas*, which signifies thirsty. See Deuteronomy, viii. 15. Cuvier has given this name to a genus of serpents. See index to SERPENTS.

DIPTERA (from δις, and πτερον, *wing*), an order of insects which have only two wings, and under each wing a style, or oblong body, terminated by a protuberance or head, and called a *balancer*. See index to ENTOMOLOGY.

DIPTEROS. See index to ARCHITECTURE.

DIPTOTE, in *Grammar*, a noun that has only two cases; as *suppetiæ*, *suppetias*, &c.

DIPTYCHA, in *Antiquity*, a public register containing the names of the consuls and other magistrates among the pagans; and of bishops, martyrs, and others among the Christians.

The word is formed from the Greek διπτυξ, which is compounded of δις, *twice*, and πτυσσω, *I fold or plait*; though there were some in three, and others in four or five leaves.

There were secular diptycha in the Greek empire, as well as sacred ones in the Greek Church. The former were the matricula or registers wherein the names of the magistrates were entered; in which sense diptycha is a term in the Greek chancery.

The *Sacred* DIPTYCHA consisted of a double catalogue, one part of which contained the names of the living, and the other those of the dead, which were to be rehearsed during the office. We meet with something not unlike the sacred diptycha of the Greeks in the canon of the mass according to the Latin usage, where the people are enjoined to pray once for the living and once for the dead. In such diptycha were entered the names of bishops who had governed their flock aright; and also the names of such as had done any signal service to the church, whether they were living or dead; and mention was made of them in the celebration of the liturgy.

Casaubon, in his observations on Athenæus (lib. vi. cap. 14), supposes the Christians to have borrowed the custom of writing names in a book, and rehearsing them at mass, from the heathens, who entered the names of persons to whom they wished to do any signal honour in the verses of the Salii, as was done in the case of Germanicus and Verus, sons of the emperor Marcus Aurelius, and a long time before, during the ages of the republic; in that of Mamercus Veturius and Lucia Volumnia, as we are told by Tacitus, Spartian, Ovid, Festus, Plutarch, and others. But Rosweyd does not approve of this notion of Casaubon; and the pretended St Dionysius, a very ancient author, asserts that this usage was originally founded on Scripture (2 Tim. ii. 19; Psal. cxvi. 15). Rosweyd adds Ecclesiasticus (xliv. 1), and maintains these to have been the passages which the ancient church had in view, rather than the Salian verses.

The secular diptycha were frequently sent as presents to princes and others, on which occasions they were finely gilded and embellished; as appears from Symmachus (lib. ii. ep. 81). Those presented were usually of ivory. The first law, *De Expens. Ludor.* in *C. Theod.* forbids all magistrates below the rank of consuls to make presents of diptycha of ivory in the public ceremonies.

DIRÆ, a name of the three Furies. See EUMENIDES.

DIRECT, in *Arithmetic*, is when the proportion of any terms or quantities is in the natural or direct order in which they stand. It is the opposite of inverse, which considers the proportion in the inverted order of the terms. Thus, $3:4::6:8$ directly; or inversely $4:3::8:6$.

DIRECTION, in *Mechanics*, the line or path in which a body moves or endeavours to proceed according to the force impressed upon it.

DIRECTION, in *Astrology*, a kind of calculus by which it is pretended to find the time in which any notable accident shall befall the person whose horoscope is drawn.

DIRGE, a song or hymn expressive of grief and mourning, as for the dead. It is a contraction of the Latin *dirige*, the first word in the old formula of the Catholic service for the dead.

DIRIBITORES, in *Roman Antiquity*, officers appointed to distribute the tablets used by the people when they voted in the comitia. Wunder, however, in the preface to his *Codex Erfurtensis*, is of opinion that their office was to divide the votes afterwards, in order to determine the result; and this opinion he founds partly on the etymology of the word *diribere*, from *dis* and *habere*. See COMITIA, vol. vii., p. 183.

DIRIGENT, or DIRECTRIX, in *Geometry*, the line of motion along which the describing line or surface is carried in the genesis of any plane or solid figure.

DIS, a god of the Gauls, the same as Pluto the god of hell. The inhabitants of Gaul supposed themselves descended from that deity; and from that circumstance they reckoned their time by *nights* instead of by days.

DIS, a prefix or inseparable preposition in various words, the effect of which is either to give them a signification contrary to what the simple words have, as *disoblige*, *disobey*; or to signify a separation or detachment, as *distributing*.

DISAFFORESTING, the depriving of forest laws and their oppressive privileges, or the act of reducing from the privileges of a forest to the state of common ground.

DISC or DISK (Lat. *discus, a quoit*), the face of the sun or any planet as it appears to the eye. In optics it denotes the width of the aperture of telescope glasses. In botany it is applied to the central part of a radiate compound flower. It is also used generally for any circular plane surface.

DISCIPLE (from *disco*, *I learn*), a scholar or follower of any teacher or philosopher. The followers of Jesus Christ in general were so called: but in a more restricted sense, the term was used to denote those alone who were the immediate followers and attendants on his person, of which there were seventy or seventy-two. The terms *disciple* and *apostle* are often used synonymously in the Gospel history; but the apostles, as distinguished from disciples, were the twelve selected to be the principal ministers of the Christian religion. The Latins kept the festival of the seventy or seventy-two disciples on the 15th July, and the Greeks on the 4th January.

DISCIPLINE, in a general sense, denotes instruction and government; as military or ecclesiastical discipline.

Book of DISCIPLINE, in the Church of Scotland, is a common order, drawn up by the assembly of ministers in 1650, for the reformation and uniformity to be observed in the discipline and policy of the church. In this book episcopal government is set aside; kirk-sessions are established; the observance of saints' and other holy days is condemned; and other regulations for the government of the church are prescribed. This book was approved by the privy-council, and is called the *First Book of Discipline.* A *Second Book of Discipline*, containing a fuller account of the polity of the Church of Scotland, especially in reference to the civil powers, was drawn up by the Assembly of 1578, and was frequently discussed by the King and Parliament, but did not receive their sanction.

DISCORD, disagreement among persons or things.

DISCORD, in *Music*, disagreement of sounds heard simultaneously; dissonance. See MUSIC, § *Harmony*.

DISCORD, the goddess of, in Pagan theology, is represented by Aristides with fiery eyes, a pale countenance, livid lips, and wearing a dagger in her bosom. It was she who, at the marriage of Peleus and Thetis, threw in the golden apple, on which was written "To the fairest," and which occasioned a contention between the goddesses Juno, Minerva, and Venus, each pretending a title to the apple. She was likewise called *Ate* and *Eris*.

DISCOUNT, in *Commerce*, is commonly applied to the sum allowed by the seller to the buyer for ready money payment, and is generally a deduction of a certain percentage on the principal for the usual term of credit. It is customary for persons in business to take bills or promissory notes for monies due, payable to them or their order at a certain date; and if they have occasion for money before the time is elapsed, they get these bills or notes *discounted* or cashed by a banker before the time of payment. Bills of exchange are also discounted by bankers; and in this consists one article of the profits of banking.

DISCRETE or DISJUNCT PROPORTION is when the ratio of two or more pairs of numbers or quantities is the same, but there is not the same proportion between all the four numbers. Thus, if the numbers 3 : 6 :: 8 : 16 be considered, the ratio between 3 : 6 is the same as that between 8 : 16, and therefore the numbers are proportional; but it is only discretely or disjunctly, for 3 is not to 6 as 6 to 8; that is, the proportion is broken off between 8 and 3, and is not continued as in the following continual proportionals, 3 : 6 :: 12 : 24.

DISCRETE Quantity is such as is not continued and joined together in its parts. Such, for instance, is any number; for its parts, being distinct units, cannot be united into one continuous or continued quantity; for in a continuum there are no actual determinate parts before division, but they are potentially infinite.

DISCRETION (Lat. *discretio*, a *separating; discretus* from *discerno*;) that kind of prudence for discernment which enables a person to judge critically of what is correct and proper, particularly as regards his own conduct in any matter.

DISCUS, in *Antiquity*, a quoit, or circular plate of stone or metal, ten or twelve inches in diameter, which was used by the ancients for throwing to a distance as a gymnastic exercise. Sometimes a kind of quoit of a spherical form was used for the same purpose; and through a hole in its centre a thong was passed, to assist the player in throwing it. (See *Iliad* ii., xxiii. *Od.* viii., xvii.) In the British Museum there is a famous statue of a discobolus in the act of throwing the discus.

DISCUTIENTS (Lat. *discutiens, dispersing*), medicines or applications which disperse tumours, or any stagnating or coagulated fluid in the body.

DISDIACLASTIC CRYSTAL, a name given by Bartholine and others to the mineral more usually called *Iceland crystal*. See MINERALOGY.

DISDIAPASON, in *Music*, the interval of two octaves, or a fifteenth.

DISEASE. See PATHOLOGY, MEDICINE, &c.

DISEMBOGUE (Fr. *emboucher*), to flow out at the mouth, as a river discharges its waters into the ocean. As applied to a ship, it signifies to pass out of a gulf or bay.

DISFRANCHISEMENT (*dis*, and Teutonic *frank, free*), the act of disfranchising or depriving of the rights and privileges of a free citizen, or of some particular immunity.

DISGUISE, a counterfeit habit. Persons doing unlawful acts in disguise are by our statutes subjected to heavy penalties, and in some cases declared felons. By an old statute, commonly called the *black act*, persons appearing disguised and armed in a forest or grounds inclosed, or hunting deer, or robbing a warren or a fish-pond, are declared felons.

DISH, among miners, a trough in which ore is measured, about 28 inches long, 4 deep, and 6 wide.

DISK. See DISC.

DISJUNCTIVE, separating, disjoining. In *Grammar*, a disjunctive conjunction is a word that connects sentences or words in construction, but disjoins the sense; as, I love him, *or* I fear him; I neither love *nor* fear him.

DISLOCATION, the act of moving something from its proper place; applied more particularly to the act of forcing a bone from its socket. This is otherwise termed *luxation*.

DISPART, in *Gunnery*, to set a mark on the muzzle ring of a piece of ordnance, so that a sight-line from the top of the base-ring to the mark on or near the muzzle may be parallel to the axis of the bore.

DISPATCH or DESPATCH (Fr. *dépêcher*, Span. *despachar*, to hasten, to expedite), speedy performance; execution or transaction of business with due diligence, &c. It is hence used to denote a letter on some affair of state or other business of importance, sent or to be sent with care and expedition by a courier express. The word is also applied to the packet or mail that carries such letters.

DISPAUPERED is used of a person suing *in forma pauperis*, if, before the suit be ended, he have any lands or other estate fallen to him, or if he become otherwise disqualified.

DISPENSARY, a house, place, or store, in which medicines are dispensed to the poor, and where they may obtain medical advice gratis. A shop in which medicines are prepared is sometimes called a dispensary or dispensatory.

DISPENSATORY, a book containing the method of preparing the various kinds of medicines used in pharmacy. Such are those of Bauderon, Quercetan, Zwelfer, Charas, Bate, Mesue, Salmon, Lemery, Quincy, and Lewis; but the latest and most esteemed, besides the London and Edinburgh pharmacopœias, is the Edinburgh New Dispensatory, first edited by Dr Duncan, and afterwards by Dr Christison.

DISPERSION (Lat. *dispergo*), the act of scattering, the state of being scattered.

In *Optics*, it denotes the divergency of the rays of light, or rather the separation of the different coloured rays in refraction. The *point of dispersion* is the point from which the refracted rays begin to diverge. See OPTICS.

DISPERSION *of Mankind*, in the history of the world, was occasioned by the confusion of tongues, and took place in consequence of the overthrow of Babel at the birth of Peleg (whence he derived his name); and by the account given of his ancestors (Gen. chap. xi. 10-16), this appears to have happened in the 101st year after the Flood, according to the Hebrew chronology, and by the Samaritan computation in the 401st. However, various difficulties have been suggested by the older chronologists concerning the true era of this event. Sir John Marsham and others, in order to reconcile the Hebrew and Egyptian chronologies, maintain a dispersion of mankind before the birth of Peleg; whilst others, unable to find numbers sufficient for the plantation of colonies in the space of 101 years, according to the Hebrew computation, fix the dispersion towards the end of Peleg's life, thus following the computation of the Jews. Petavius assigns the 153d year after the Flood; Cumberland the 180th; and Usher, though he generally refers it to the time of Peleg's birth, in one place assigns the 131st after the Flood for this event. Mr Shuckford supposes the dispersion to have been gradual, and to have commenced with the separation of some companies at the birth of Peleg, and to have been completed thirty-one

years afterwards. According to the calculation of Petavius, the number of inhabitants on the earth at the birth of Peleg amounted to 32,768; but Cumberland makes them 30,000; Mede estimates them at only 7000 men, besides women and children; and Whiston, who supposes that mankind now double themselves in about 400 years, and that they doubled themselves between the deluge and the time of David in sixty years at a medium, when their lives were six or seven times as long as they have been since, by his computation produces about 2389; a number much too inconsiderable for the purposes of separating and forming distinct nations. This difficulty induced Whiston to reject the Hebrew and to adopt the Samaritan chronology, as many others have done; which, by allowing an interval of 401 years between the Flood and the birth of Peleg, furnishes, by the last-mentioned mode of computation, more than 240,000 persons.

The hypothesis of Dr Bryant on this subject is characterized by his usual acuteness and learning. He recognizes two distinct dispersions,—the one universal, regulated and progressive; the other local, sudden, turbulent, and attended with marks of the Divine displeasure. He maintains that the dispersion, as well as the confusion of tongues, was local, and limited to the inhabitants of the province of Babel; that the separation and distribution recorded to have taken place in the days of Peleg (Gen. x. 25, 31, 32), which was the result of Divine appointment, occasioned a general migration; and that all the families amongst the sons of men were concerned in it. The house of Shem, from which the Messiah was to spring, was particularly regarded in this distribution. The portion of his children was near the place of separation: they in general had Asia to their share, as Japheth had Europe, and Ham the large continent of Africa. But the sons of Cush would not submit to the Divine dispensation. They went off under the conduct of Nimrod, and seem to have been for a long time in a roving state. However, at last they arrived at the plain of Shinar; and, having ejected Ashur and his sons, who were placed there by Divine appointment, seized his dominions, and there laid the foundation of a great monarchy. But afterwards fearing lest they should be divided and scattered abroad, they built the tower of Babel as a land-mark to which they might repair, and probably to answer the purposes of an idolatrous temple, or high altar dedicated to the host of heaven, from which they were never long to be absent. They only, viz. the sons of Cush, or the Cushites, and their associates from other families, who had been guilty of rebellion against Divine authority, and of wicked ambition and tyranny, were punished with the judgment of confounded speech through a failure in labial utterance, and by the dispersion recorded in Genesis; in consequence of which they were scattered abroad from this city and tower, without any certain place of destination. The Cushites invaded Egypt, or the land of Mizraim, in its infant state, seized the whole country, and held it for some ages in subjection; and they extended likewise to the Indies and Ganges, and still farther, to China and Japan. From them the province of Cushan or Goshen in Egypt derived its name.

The following enumeration of nations as constituted by the dispersion, is drawn up by Dr Pye Smith, availing himself of the labours of Bochart, J. D. Michaelis, the younger Rosenmüller, Gesenius, Robinson, and Baumgarten.

I. Sons of JAPHETH, the *Iapetus* of the Greeks.

1. Gomer. This name is traced in the Kimmerii of Homer and Herodotus; the Gomares (Josephus, *Antiq.* i. 6), whence Kelts, Gauls, Galatians; the Kymry; all the Celtic and Iberian tribes, Welsh, Gaelic, Irish, Breton; the Cimmerian Bosporus, Crimea.

Sons of Gomer:—(1.) Ashkenaz. Axeni, inhabitants of the southern coasts of the Euxine Sea, where we find a country Askania and a river Askanius, and a large part of Armenia; the Basques in the north of Spain; the Saxons, as the Jews interpret Ashkenaz, in Jer. li. 27, to be Germany. (2.) Riphath. Rhibii, east of the Euxine; Tobata and other parts of Paphlagonia; Croatia; the Riphæan mountains, a very obscure name in ancient geography (Strabo, Virgil, Pliny, Mela), referring probably to the great chains of mountains from the north of Asia westwards (Hyperboræans, Steph. Byzant.), and therefore including vague knowledge of the Uralian, Hartz, and Alpine regions. (3.) Togarmah. Peoples of Armenia and other parts of the Caucasian region. The Armenian traditions assign as their ancestor Haik, the son of Torgom and grandson of Noah.

2. Magog. In Ezekiel this seems to be used as the name of a country, and Gog that of its chieftain. The Mongoles, Moguls; the great Tartar nation.

3. Madai. The Medes; people of Iran, to whom the Sanscrit language belonged; primeval inhabitants of Hindustan.

4. Javan. The Greeks, Asiatic and European. Iaones (Hom. *Il.* xiii. 685).

Sons of Javan:—(1.) Elisha. Greeks especially of the Peloponnesus; Hellas; Elis, in which is Alisium (*Il.* ii. 617). (2.) Tarshish. The east coast of Spain, where the Phœnician Canaanites afterwards planted their colony. (3.) Kittim. Inhabitants of the isles and many of the coasts of the Mediterranean, particularly the Macedonians and the Romans, and those farther to the west. (4.) Dodanim (Rhodanim, 1 Chron. i. 7). Dodona, a colony from which probably settled at the mouths of the Rhone, Rhodanus. To this Javanian (Ionian) branch is attributed the peopling of the "isles of the nations" (ver. 5), a frequent Hebrew denomination of the western countries to which the Israelites, Tyrians, Egyptians, &c., had access by sea.

II. Sons of HAM. The word signifies *heat* or *hot*, alluding to the climes which the most of his posterity were to occupy: it was also an indigenous name of Egypt.

1. Cush. The Ethiopians, first on the Arabian side of the Red Sea, then colonizing the African side, and subsequently extending indefinitely to the west, so that *Cushite* (Jer. xiii. 23) became the appellative of a negro.

Sons of Cush:—(1.) Seba. Joined with Mizraim and Cush (Isa. xliii. 3), evidently denoting contiguity and affinity. This tribe or class is probably referred to Suba, a native name of Meroe upon the Nile, in the farthest south of Egypt, or the beginning of Ethiopia. (2.) Havilah. Of this word vestiges are found in various names of places in Western Arabia, and the adjacent parts of Africa. It is quite distinct from the Havilah (Gen. ii. 11) in or near Armenia, and probably from another (x. 29) in Arabia, unless we suppose a union of tribes, or one succeeded by the other. (3.) Sabtah. Sabota or Sabbatha is the name of an ancient trading town of Arabia. (4.) Raamah, Sept. *Rhegma* (Alex. *Rhegehma*), which changing *ι* into *η*, is the name of a port which the Ægypto-Greek geographer Claudius Ptolemy places on the Arabian coast of the Persian Gulf. To this place Dr Baumgarten (Kiel, 1843) refers the name—others take it to be Reama, a town of considerable importance in the south-western part of Arabia the Happy, whose inhabitants are remarkably black; mentioned along with Sheba in Ezek. xxvii. 22, as a place of rich Oriental traffic. Two sons of this Raamah are mentioned, Sheba and Dedan. We find these in the subsequent Scriptures distinguished for trade and opulence. They both lie in the western part of Arabia. The queen of Sheba came to the court of Solomon. Dedan is not improbably considered as the origin of Aden, that ancient seaport and island at the mouth of the Red Sea. (5.) Nimrod, who built, besides Babel, his metropolis, three cities or towns in the great plain of Shinar—Erech, Accad, and Calneh. These were probably Aracca or Arecha on the Tigris (some think Edessa); Sacada, near the confluence of the Lycus and the Tigris; and the third (Calno, Isa. x. 9) Chalonitis of the Greeks, afterwards called Ctesiphon; but much obscurity lies upon these conjectures.

2. Mizraim, literally the *two Egypts*, the upper and the lower; each was called *Misr*, a word even now vernacular in that country. Of his descendants seven are specified under *plural* national names, some of which are well ascertained. (1.) Ludim. Ludites, celebrated as soldiers and archers, and in those passages connected with other peoples known to be African. The Ludim probably lay towards Ethiopia. They must not be confounded with the Lydians of Asia Minor (Gen. x. 22). (2.) Ananim. Very uncertain. Bochart supposes them to have been wandering tribes about the temple of Jupiter Ammon, where was an ancient people called Nasamones. (3.) Lehabim. Perhaps inhabitants of a coast-district immediately west of Egypt. Probably the Lubim. (4.) Pathrusim. The people of the Thebaid (Pathros) in Upper Egypt. (5.) "Casluhim, out of whom came Philistim." A people on the north-east coast of Egypt, of whom the Philistines were a colony, probably combined with some of the Caphtorim. (6.) Caphtorim. Inhabitants of the island Cyprus.

3. Phut. This word occurs in two or three passages besides, always in connection with Africa. Josephus and Pliny mention an African river, Phutes. The great modern archæologist and geogra-

pher, Ritter, says that hordes of peoples have been poured out of Futa, in the interior of Africa.

4. Canaan. His descendants came out of Arabia, planted colonies in Palestine, and gradually possessed themselves of the whole country.

His children or posterity :—(1.) Sidon, his first-born, founded the city of that name. (2.) Heth, the ancestor of the Hittites. The remaining *nine* are well known, and are here laid down in the singular of the patronymic, or patrial adjective—the Jebusite, the Emorite (Amorite), the Girgashite, the Hivite, the Arkite, the Sinite, the Arvadite, the Zemarite, and the Hamathite. All are assigned to Palestine, and the boundaries of the country are precisely laid down.

III. Shem, though here introduced last, is declared to be the eldest of the three brothers. The reason of this order evidently is the design of the historian to pursue the line of the favoured people which the Divine Sovereign would raise up in the posterity of Shem, and in which, " when the fulness of the time should come," " all the families of the earth should be blessed."

Children of Shem :—1. Elam. The ancestor of the Elamites or Elymæans, who possessed Elymais, a region between Susiana and Media, now called Khusistan. The Japhetian Persians afterwards entered that region and gained the ascendency, and subsequently they were comprehended under the name of Elam.

2. Ashur, the ancestor of the Assyrians.

3. Arphaxad, a personal name in the Abrahamic line. The word, a remarkable compound, probably denotes *Neighbouring to the Chasdim, i.e.* Chaldæans. The name appears in *Arrhapachitis*, a province in Northern Assyria, the primitive seat of the Chasdim, and near to which, or in it, Abraham was born.

Children of Arphaxad :—These are chiefly personal, and contribute to form the sacred pedigree which leads to the Messiah. In this line are mentioned two grandsons, Peleg, and Eber, from whom is derived the name Hebrew. Joktan is universally acknowledged to be the father of the numerous tribes of Arabs in *Yeman*, or Arabia the Happy. Of the founders of those tribes thirteen are specified. The first is evidently *Modad*, with the Arabic article: the second is *Shaleph;* and Ptolemy mentions a people of interior Arabia, the Salapeni. *Hatzarmaveth* is a fruitful district on the south coast, which still bears exactly the same name. That name signifies the *Enclosure, Gate,* or *Court of Death*, on account of its insalubrity, arising from the great abundance and mixture of powerful odours. Jerach signifies the *moon;* and on the west of this region is a gold-producing tract, in which are the Mountains of the Moon, which yet must be distinguished from a group in East Africa, very imperfectly known, and called also by Orientals the Backbone of the World. *Hadoram*, the Adramites of Ptolemy and Pliny, on the south coast. *Uzal*, mentioned in Ezek. xxvii. 19, which should be translated " Vedan and Javan [perhaps Yemen ?] from Uzal." The ancient name of a principal city of Yemen, now Sanaha. *Obal* (Ebal in 1 Chron. i. 22), unknown. *Abimael*, unknown; the meaning is, *my father Mael*, and Bochart adduces the Mali of Theophrastus and the Minæi of Strabo, a tribe or tribes in Arabia, as possibly intended. *Sheba*, probably indicating an invasion of this tribe upon the Cushite Sheba and Dedan. (Gen. x. 7, and xxv. 3.) From such mixtures much embarrassment often arises in ethnography. Sheba and Seba (x. 7), are often mentioned in the Old Testament as seats of great riches and traffic. *Ophir*, undoubtedly referring to the seaport in South Arabia, so celebrated for its traffic in gold, jewellery, and fine woods. The same name was probably given to places in India and East Africa, to which the mercantile ships of this Arabian Ophir resorted. A part of the south coast of Arabia is called Oman, and in it is a town called *El-Ophir*, with the article. *Havilah;* perhaps the Cushite settlers were invaded by this Joktanite tribe. *Jobab:* Ptolemy mentions a people, *Iobaritæ*, on the east coast of Arabia. The *r* may be a mistake, or a dialectic variety, for *b*. These thirteen tribes seem to have formed the confederacy of the independent and unconquerable Arabs, whose peninsular, desert, and mountainous country defended them from invasion: Ishmael and his descendants were united with them.

Our text concludes with describing a boundary line for the country of these tribes " from Mesha to Sephar." The former is probably the country Maishon or Mesene, at the north-west head of the Persian Gulf; and the latter, on the south-west coast of Arabia, where is found a Mount Sabber.

4. Lud. From him the Lydians in Asia Minor derived their name.

5. Aram. From him the inhabitants of Syria, Chalonitis, and a considerable part of Mesopotamia.

Children or posterity of Aram :—(1.) Uz. In the northern part of Arabia, bordering upon Chaldæa: the land of Job. (2.) Hul. The large flat district in the north of Palestine, through which lies the initial course of the Jordan, even now called the Land of Hûleh, and in which is the Lake Hûleh, anciently Merom, amply illustrated by Dr Robinson (*Researches*, iii. 339-357). (3.) Gether. East of Armenia; Carthara was a city on the Tigris. (4.) Mash. A mountain region branching eastwards from the great Taurus ridge; the Masian mountains of the Greeks and Romans.

DISPLAYED, in *Heraldry*, a term used to express the position of an eagle, or other bird, when it is erect, with its wings expanded or spread forth.

DISPONDEE, in the Greek and Latin poetry, a double spondee or foot; as *cōnclūdēntēs.*

DISPONE, in *Scots Law*, to make over or convey to another in a legal form.

DISQUISITION (from *dis* and *quæro, I seek*), a formal or systematic inquiry into the nature, kinds, and circumstances of any problem, question, or topic, by arguments, or by discussion of the facts and circumstances that may serve to elucidate truth. It is chiefly applied to a written treatise, and is synonymous with *dissertation.*

DISS, a market-town in the county of Norfolk, on the Waveney, 20 miles S.S.W. of Norwich, and 84 miles from London. It consists chiefly of three wide and well-paved streets. The parish church is an elegant edifice of the early English style. Its chief manufacture is that of coarse hempen cloth. Market-day, Friday. Population (1851) 2419.

DISSECTION. See Anatomy.

DISSEISIN, in *Law*, an unlawful dispossessing a person of his lands or tenements.

DISSENTER, one who dissents or differs from another in opinion. In matters of religion, it denotes one who separates from, or does not unite with, any established church. In this sense all seceders are dissenters, though a distinction, rather verbal than real, is sometimes drawn between the two. The word dissident is sometimes used in a similar sense.

DISSIMULATION, the act of dissembling, by means of false appearances or pretensions.

DISSIPATION, in *Physics*, the insensible loss or waste of the minute parts of any body, which fly off, and thus cause its diminution or consumption.

Circle of Dissipation, in *Optics*, the circular space upon the retina which is taken up by one of the extreme pencils of rays issuing from an object.

DISSOLUTION, in *Physics*, a discontinuation or analysis of the structure of a mixed body, by which what was one and contiguous is divided into parts, either homogeneous or heterogeneous. It is a general name for all reductions of concrete bodies into their smallest parts, without any regard either to solidity or fluidity.

DISSOLVENT, anything that has the power of melting or converting a solid into a fluid; or that reduces a solid body into such minute parts as to be sustained in a fluid. The fluid in which anything is dissolved is commonly termed a *menstruum.*

DISSONANCE, in *Music*. See Music, § *Harmony.*

DISSYLLABLE, a word of two syllables.

DISTAFF, an instrument about which flax or wool is tied and from which the thread is drawn in order to be spun.

DISTANCE (Lat. *disto, I stand apart*), an interval between two things, with regard either to time or place.

Accessible Distances, in *Geometry*, such as may be measured by the chain. *Inaccessible Distances*, such as cannot be measured by the chain, on account of a river or other obstruction between one object and another.

Distance, in *Astronomy*. The distance of the sun, planets, and comets, is found only from their parallax, as it cannot be found either by eclipses or their different phases; for, from the theory of the motions of the earth and planets, we know at any time the proportion of the distances of the sun and planets from us; and the horizontal parallaxes are in a reciprocal proportion to these distances. See Astronomy.

DISTEMPER, a morbid condition of an animal body; dis-

ease. It is particularly applied to the diseases of the brute creation. The disease known as *the distemper* in dogs is noticed under the head VETERINARY SCIENCE, § *Influenza.*

DISTEMPER, or DESTEMPER, in *Painting*, a preparation of opaque colour, ground, and mixed with water and size, or with gluten, albumen, or other glutinous matter. It is much employed in decoration and scene-painting. When used on a small scale it is commonly termed *body-colour.*

DISTENSION, the act of stretching in length or breadth, or in every direction; the state of being stretched out or distended; &c.

DISTICH, a couplet; a couple of verses making complete sense; an epigram of two lines.

DISTICHIASIS, in *Surgery*, a disease of the eyelids, when under the ordinary eye-lashes there grows another extraordinary row of hairs, which frequently eradicates the former, and, pricking the membrane of the eye, excites pain, and causes a defluxion. It is cured by pulling out the second row of hairs with nippers, and cauterizing the pores out of which they have been extracted.

DISTILLATION.

This term is applied to the manufacture of ardent spirits, through the agency of heat applied to a vessel called a *still*, which contains the fermented liquor from which the spirit is to be extracted; and the spirit as it is vaporized is condensed in tubes from which it *distils*, or falls in drops, into the vessel placed to receive it. Hence the application of the term distillation. We know little relative to the antiquity of this manufacture. To the nations of antiquity it seems to have been unknown, at least we have no distinct accounts of its preparation. It is commonly supposed to have been invented by the barbarians of the north of Europe as a solace to their cold and humid climate, and to have been made known to the more southern nations by Arnoldus de Villa Nova and his pupil Raymond Lully of Majorca. At the present day there are few nations above the stage of savages who do not manufacture an ardent spirit by a process of distillation. Whether these ardent spirits are prepared from the expressed juices of fruits, from the natural or expressed juices of trees and plants, or from infusions of grains or of roots, chemistry has made known to us that they can alone be prepared from sugar, or from principles which, during the process of infusion and fermentation, are converted into sugar. In this country the great proportion of the ardent spirit is prepared from barley, which in its natural state contains no sugar; but, by the process followed, the large quantity of starch which it contains is converted into sugar; and the saccharine infusion being fermented the sugar becomes converted into alcohol, which is obtained from it by distillation.

Only two of the five species of sugars are of interest to the distiller in this country, viz., cane sugar and grape sugar; the other three, milk sugar, liquorice sugar, and manna sugar, are to the distiller mere curiosities, inasmuch as manna sugar is unfermentable, liquorice sugar is only used in colouring and flavouring porter, and milk sugar, though capable of fermentation and furnishing an ardent spirit on distillation, is not met with in sufficient quantity to be of any value to him.

Cane sugar embraces many varieties, which, though furnished by different plants, are identical in properties and composition. Of these the chief are sugars from the sugar cane, from the palm trees and date (called jaggery) from the maple, maize, and millet. The juices of the plants yielding these sugars are distinguished from those yielding grape sugar by containing very little acid. All these sugars assume regular crystalline forms when fermented; they assume the form of the grape sugars before changing to carbonic acid and alcohol; and the fermented infusions or juices yield on distillation ardent spirits known by the names of rum, arrack, &c.

It is from the *grape sugars*, however, that the great proportion of the ardent spirit used in this country is produced. The grape sugars embrace many varieties procured from different sources, yet having all the same chemical composition. These embrace the sugar of the grape, honey, the sugar of most of our fruits, and the sugar made from starch. All the juices containing naturally grape sugar are more or less acid, and the chemical reason for this is, that acid possesses the property of converting cane sugar into grape sugar, in like manner as it converts starch into grape sugar. These sugars do not crystallize so readily as cane sugar, but they ferment with extreme facility, and furnish on distillation the spirits known by the names of brandy, whisky, gin, &c.

Milk sugar exists in milk, to which it imparts its sweetness. It is readily fermentable, and when distilled furnishes the ardent spirit called *arraca*, in use among the Tartars; while the fermented milk itself is largely used by various nations, and is styled *koumiss* by the Tartars, *leban* by the Arabs, and *yaourt* by the Turks.

When these sugars are dissolved in water, and fermented, as was explained under the article BREWING, they become resolved into carbonic acid gas, which escapes, and alcohol, which remains in the fluid. It is this alcohol (spirit, or spirit of wine) which is the substance producing the stimulant and intoxicating property in all the forms of ardent spirit; and it is the separation of this from the large quantity of water and impurities with which it is mixed in the fermented liquid which constitutes the art of distillation.

The several flavours peculiar to each separate kind of ardent spirit, and which serve to distinguish them from each other, are supposed to be owing to the presence of an essential oil, derived from the ingredients employed in the manufacture; but as yet chemists have only discovered the presence of œnanthic acid, œnanthic ether, and oxyhydrate of amyle, substances which are sufficient of themselves to impart the peculiar odour, without supposing it to be owing to an essential oil whose presence has escaped detection. It is a singular fact, however, that these peculiarities of flavour or of odour are only imparted to the spirit when it is distilled from the fermented juice or sap itself; but when fermented infusions of the sugars prepared from these juices are subjected to distillation, no peculiarity of odour is manifested. Thus the fresh cane juice, when fermented and distilled, yields the high-flavoured spirit called *rum;* but sugar and molasses fermented and distilled in this country yield only plain spirits—whisky.

From whatever ingredient the ardent spirit is to be derived, the processes through which it must pass before being distilled are virtually the same. The saccharine juices or infusions, whether derived from the grape, sugar-cane, date, barley, or other grains, or potato, beet, or other roots, must first be fermented to change sugar into alcohol. The fermented liquor must then be put into a close covered vessel or still, which terminates in a conical head, to which is attached a convoluted tube, or *worm* as it is called, the end of which terminates in a vessel called a *safe*. This worm runs through or is placed in a large vessel called the *worm-tub*, or refrigerator, which receives a constant and plentiful supply of cold water. Fire or steam is then applied to the

still, when the spirit, being more volatile than water, rises as vapour, passes through the worm where it is condensed, and runs in a fluid state through the safe into the receiver.

This is the method adopted by distillers who use the flat-bottomed old stills, and is the mode chiefly used on the Continent. Before a pure spirit of the requisite strength can be got by this plan, the product of the first distillation has to be redistilled once, twice, or even three times; and the use of the safe is to enable the man who works the still to test the quality of the running liquor, the pure being put into a receiver by itself, and the impure by itself to be redistilled.

The other stills in use are termed patent stills, and make the spirit of the proper strength and purity at one distillation. The operation of this kind of still will be explained afterwards.

As in this country the attention of the distiller is almost entirely limited to the manufacture of one kind of spirit, we shall first notice—

Whisky, a corruption of the Irish word usquebaugh. This ardent spirit may be manufactured from barley malt alone, from the raw or unmalted barley mixed with from a third to a ninth of malt, from a mixture of raw barley, wheat, rye, or oats, with from a sixth to a tenth of barley malt, or from a mixture of raw barley, or big, with sugar, or from sugar or molasses alone. When barley malt is alone used, the processes are simple, and the spirit produced has a more agreeable flavour, and is more esteemed; but, in consequence of the heavy duty on malt, distillers have been induced to employ large quantities of unmalted grain, and of late years no small proportion of sugar and molasses, adding merely enough of malt to induce the chemical conversion of the starch in the unmalted grain into grape sugar.

To save reference to what was stated under the article BREWING, it may be recapitulated here, that, during the germination of barley (as in its conversion into malt) a peculiar substance is generated in the grain called *diastase*, which acts chemically on the starch of the grain, converting it first into a kind of gum called *dextrine*, and then into a sweet substance identical in composition with grape sugar. It has been found that this diastase can convert 2000 parts of starch into grape sugar; and it is of this valuable property that the distiller avails himself when he adds malt to his raw grain. To save the more expensive article malt, he uses only so much as experiment has proved will suffice to change the starch of the raw grain into sugar when mixed with it in his mash tun. The distiller, therefore, to prepare the saccharine fluid for his operations, has to go through all the processes of brewing before he gets it ready for the still. The processes followed by him will therefore be shortly described under the heads of *mashing*, *cooling*, *fermenting*, and *distilling*.

Mashing.—The barley, big, rye, oats, or other grains to be used are reduced to a fine meal, and mixed with the proper proportion of malt which has been previously merely bruised. In some Scottish distilleries the following mixture of grains is used, but the proportions and kind of grains vary in each separate distillery:—malt, 42 bushels; oats, 25 bushels; rye, 25 bushels; and barley, 158 bushels. If 40 bushels of barley, and 20 of malt, are the proportions to be used in one process, then 600 or 700 gallons of water, at the temperature of 150° Fahrenheit, are mixed with these in the mash tun, care being taken to break all the masses either by means of hand oars and rakes, or by those worked by machinery. This agitation and mixing is continued for an hour and half or longer; and to keep up the heat of the mass and furnish enough of fluid, additional 500 gallons of water are let in at intervals at a temperature of about 190°. A very superior machine has quite recently been patented, and is now being introduced into breweries and distilleries for the purpose of mashing the grain or malt. It consists of a cylindrical box about a foot in diameter, and six feet in length. Through this passes a strong wooden rod or axle fitted with wooden teeth set on at right angles, and so long as nearly to touch the sides of the cylinder. The bruised grains and hot water are then admitted at one extremity, and the toothed axle being caused to revolve rapidly mixes the grain and water more thoroughly than could be done by manual labour. The machine lies at a gentle slope, so that the mixed mass pours from its other extremity in a continuous stream into the mash tun. The mash is then covered up and allowed to rest for an hour or two. If the mash be tasted when first made, it is found to have little or no taste, but as it stands it becomes sweeter and sweeter, in consequence of the conversion of the starch into the grape sugar under the action of the diastase in the malt. If more care were taken to regulate the temperature of the mash, and keep it at that point which experiment has proved is most favourable to the action of the diastase on the starch (viz. 158° to 167°), and also allow the mash to infuse for a longer time, it cannot be doubted that the yield of saccharine matter would be greater, seeing that at present much of the starch escapes decomposition altogether. The distiller should also consider whether it would not be advantageous for him to expose his raw grain to the heat of 300° on the kiln before mashing it, seeing this heating process would convert the whole starch of the grain into dextrine, and thus facilitate after-operations. When the proportion of raw grain is greater than that indicated above, it is usual to add a quantity of the husks of the oat to the barley meal, in order to prevent it forming hard lumps, and to allow the water to percolate more freely through the mass.

When the mashing is thus finished, it is found that, in consequence of the thickness and adhesiveness of the barley meal, it is impossible to draw off the infusion or *wort* from below, as is done in brewing. It is therefore drawn off from the top, after the grains have subsided, by means of a perforated tube which rises above the grains in the mash tun.

A second, a third, and sometimes even a fourth infusion or mashing is made on the same grains, in order to obtain all the soluble matters from them. The first mash, with the above quantities, rarely yields more than 400 gallons of wort. The second mash, made with 500 gallons of water at the temperature of 190°, after standing an hour and half or two hours, will yield fully that quantity, as the grains, now deprived of much of their starch, part more freely with the water. The third mash is generally made with 800 gallons of boiling water, and when drawn off, is either added to the other to reduce them to the required strength, or is reserved for making the first infusion at a subsequent mashing.

In former days, in consequence of the restrictions imposed by the excise laws, the distiller was obliged to make his wort of great strength; and in those days the third mash was very generally boiled down, and often had various prohibited articles (as sugar and molasses) added to it in order to raise the wort to its required strength; but as these restrictions are now very much removed, and sugar and molasses are allowed to be used, it is found profitable to work with a much weaker wort. By the present excise laws, the distiller in England is bound to run his worts into the fermenting tun not weaker than 1050 of specific gravity, nor stronger than 1090. In Scotland and Ireland the distiller's wort when let into the fermenting tun must not be of lower specific gravity than 1030, nor higher than 1080. At this strength the fermentation is more complete, and the yield of spirit is greater than when the wort is of a higher specific gravity.

Cooling is the next process to which the wort is subjected. In small distilleries it is still customary to cool the wort in wide shallow coolers of wood or of iron, placed in an exposed part of the brewery. But as wort from grain has a much greater tendency to run to acidity than that from malt, it is of great advantage to get the temperature reduced as

rapidly as possible. This is effected either by fitting up blowers or fanners, which throw a brisk current of air over the flat coolers, or, better still, by the employment of refrigerators in which the hot wort is run through tin or copper tubes which pass through cold water. Wherever a full supply of cold water can be obtained, this plan possesses advantages over that of exposing the wort to the open air in the shallow open coolers. As the wort cools, a quantity of starchy matter is precipitated; but all is carefully transferred to the fermenting tun along with the wort, and undoubtedly contributes to increase the production of spirit. During the winter and temperate months the wort is cooled down to a temperature varying from 52° to 65°.

Fermentation of the wort is the most important of all the processes, as on its perfection depends the quantity of spirit which can be extracted from the wort. In former days the slow plan of fermentation used to be very generally followed. In this case it was customary to cool down the wort to 52°, and excite the fermentation by adding yeast, which distillers used formerly to procure from the London porter breweries under the idea it was the strongest and best. The whole yeast was not added at once, but a certain portion used to be added daily for the first three or four days, and the whole process of fermentation was protracted from seven to ten or even twelve days. By this plan of fermentation the wort was rarely reduced below 1002 or 1004 of specific gravity; in fact a very large proportion of the saccharine matter escaped fermentation. This old and slow process of fermentation is therefore now very generally exploded, and the quick process adopted. The wort is by this process poured into the fermenting tun at the temperature of 65° to 76°. Good yeast from any brewery is added, in the proportion of one or one and a half gallons for every 100 gallons of wort, according to the season; and a little more is often added next day if the fermentation does not seem to be going on with sufficient vigour. Active fermentation is thus excited in six or seven hours, and the whole process is finished by the second, and never later than the third day thereafter. By the excise laws relative to distillation, mashing or fermenting, and distillation of the wort, are not allowed to be carried on in the same building during the same days. To show the regularity then with which the modern distillers work, and the advantages of the quick plan of fermentation, it may be stated that in the course of writing this article we visited a distillery and found that for several years they have had, with one exception, 52 mashing periods, and 52 distilling periods annually; the mashes being made, and the fermentation carried through and completed every Thursday, Friday, and Saturday, while the fermented wash was distilled on every Monday, Tuesday, and Wednesday. The first the distillers name their *mashing period*—the second their *distilling period*—and in most well-regulated distilleries the above order is observed, so that they have 52 mashing and 52 distilling periods during the year. The fermentation should always be carried so far as to reduce the wort to the specific gravity of water, that is, 1000. When the wort is made from molasses or sugar, it is often reduced below this gravity, but rarely when the wort is made from a mixture of raw grains. Even by this great attenuation the whole saccharine matter is not thereby converted into alcohol; for the alcohol, as it increases in the wort, gradually arrests the decomposition of the sugar, and at length stops it altogether. Even, therefore, though the specific gravity of the wort be many degrees below that of water it does not indicate that the whole sugar has been converted into alcohol, seeing that the specific gravity of alcohol is so much lighter than that of water, that its presence in the wort reduces the specific gravity below that of water, even though a considerable amount of sugar remains undecomposed. It is the presence of this large quantity of undecomposed sugar in the *spent wash* (wort from which the spirit has been distilled) which gives it its sweet taste, and makes it valuable to the dairyman as an article for feeding his cows. The whole quantity, however, which escapes decomposition (or conversion into alcohol), is a loss to the distiller; but by refermenting the spent wash, or by using it for mashing a fresh quantity of grain, as is done in the manufacture of Hollands and of Rum, a considerable saving would be effected. When the wort is thus fermented, it is styled in the distiller's language the *wash*. If the fermentation flags, or is too long continued, or the temperature rises too high, a considerable loss of spirit is apt to occur in consequence of the alcohol becoming converted into acetic acid (vinegar). This change is known to occur by the wort increasing in density, the specific gravity of acetic acid being so much heavier than that of alcohol; and by the peculiar odour and taste of acetic acid becoming developed.

Distilling the wash is the next process; and the apparatus employed for this purpose is termed the *still*, of which there are many forms. The *still* is a chemical apparatus for separating the more volatile from the less volatile fluids, and it is connected with a part termed the *refrigerator*, in which the volatile vapour raised from the fluid in the *still* is condensed, and drops or distils into a vessel termed the *receiver*. The common still is a flat bottomed close vessel with a high head to prevent the fluid within boiling over. To the top of this head a tube is connected, which is carried in a spiral form round the inside of tubs or barrels filled with cold water, and from its twisted form this tube receives the name of the *worm*. The tube terminates at the bottom of the barrel, passing through it to the outside, and is conducted into the vessel termed the receiver, a stop-cock, or more commonly a vessel termed a *safe*, being usually placed on the tube where it leaves the refrigerator.

When the old excise laws, during the last century, charged the duty of spirit on the probable quantity which a still of a certain size would produce during the year, acting on the supposition that the still could only be emptied once a-week, the distillers, stimulated by the desire to evade a large portion of the duty, improved the forms of their stills, so that they emptied their stills in a few hours, instead of only once a-week. The evasion of duty thereby became at last so notorious, that a committee of the House of Commons was appointed in 1799 to investigate the matter; and the result was, that in Scotland the duty was laid on the distiller on the supposition that he could discharge an 80 gallon still every eight minutes during the whole working season. Stimulated, however, to escape the heavy duties, the distillers, by still further improvements in the form of the still, by lessening its depth, increasing its surface, and heightening its head, so improved it that stills capable of holding 80 gallons could be discharged every $3\frac{1}{2}$ minutes, and those capable of holding 40 gallons in $2\frac{1}{2}$ minutes. In the year 1815 this absurd law, which encouraged fraud, was repealed; and since then the duties have been levied on the quantity of spirit produced, irrespective of the time employed in its manufacture.

By all the old stills such a quantity of watery vapour was carried over along with the alcohol, that the distilled spirit (termed *low wines* and *feints*), had to be subjected to a second process of distillation (termed *doubling*), before it could be sent out of the proper legal strength. One of the greatest modern improvements, therefore, in this art, was the invention of a still which accomplished this end at one operation. This desirable improvement was first effected by a Frenchman, named Edouard Adam, an illiterate workman in a distillery, who, after hearing a chemical lecture on the contrivance known to chemists as the apparatus of Woulfe, applied the principle to the condensation of the vapour of alcohol. The Woulfian condenser was originally intended to impregnate water with gaseous vapours, and consisted of a range of beaked reservoirs or chambers, the beak of

each of which dipped under the fluid contained in the reservoir placed after it. Adam applied this to the condensation of the vapour of alcohol; and by causing the hot vapours to chase the alcohol from chamber to chamber, he obtained in the successive chambers alcohol of any strength and purity. He took out a patent for his invention in 1801, but it was not till after the alteration of the excise laws here in 1815 that any attention could be paid to this form of still in this country. Since that period this form of still has received various important improvements in this country so as to adapt it to the more rapid and larger operations of the British distiller, and Mr Stein's still and Mr Coffey's still are among the most perfect of these. Coffey's still, indeed, is now recognised as the best, and the most economical for preparing ardent spirit of a high per centum above proof at one operation. It may also be called a continuous still, seeing that new wash is continuously supplied as long as the still is kept in operation.

The principle which has guided the improvements in the modern stills is founded on the fact that the boiling point of alcohol varies with its density or strength; the purer it is, it requires the less heat to raise it into the state of vapour, and the more it is diluted with water the greater is the heat required to distil it. Thus alcohol of the specific gravity of ·793 boils at 168°·5 Fahr.; that of strength ·851 at 179°; and that of ·912 specific gravity at 197°. Hence, if we wish alcohol of any specific strength we have merely to keep up the heat to the point at which that spirit boils, and the spirit evaporated will have the desired strength. Such spirit will also be much purer and freer from peculiar odours, seeing that the offensive volatile oils which taint spirits are less volatile than alcohol, and only exist in quantity when the spirit has been subjected to considerable heat and has much watery vapour carried over along with it.

Coffey's *still* brings these principles into play in full perfection. In it the wash is never exposed to the direct heat of the fire, but is exposed in a series of shallow chambers, placed one over the other to the vapour of steam, which rises through the perforated bottoms of each chamber, and carries off the alcoholic vapours into the condenser. This condenser also consists of a series of chambers separated from each other by perforated plates, and is so contrived that the cold wash passing in pipes through these chambers, in its way to feed the other series of chambers, acts as the condenser to the vapour of the alcohol, the wash being gradually heated thereby, as it passes through the successive chambers. The still, therefore, consists essentially of three separate but connected parts, viz., 1st, of a large square receiver at the base, which receives the spent wash after it has been deprived of its alcohol by passing through the series of evaporating chambers; 2d, of a large square upright box, termed "analyzer," containing the series of evaporating chambers, each communicating with the one below by means of a valved tube, which only allows fluid to escape from the upper to the lower chamber, and having the dividing partition of each chamber perforated with fine apertures, to allow the steam which is admitted from below to pass from chamber to chamber through the shallow layer of wash in each. A safety or escape valve is also fitted to each chamber. The already heated wash enters the uppermost of these chambers in a continuous regulated stream, is gradually deprived of its alcohol by the steam as it passes from chamber to chamber, and at last escapes into the lower large receiver, from which it flows off after attaining a certain depth. The third part of the apparatus also consists of a square upright box, termed "condenser," divided into compartments by means of finely-perforated plates, and in each chamber is a link of the tube which carries the cold wash onwards to supply the evaporating chambers just described. The alcoholic vapours escaping from the uppermost of the evaporating chambers are carried by pipes to the lowermost of these chambers, and are partly condensed by each successive chamber being colder than the one below it, in consequence of the wash entering the pipes from above, and only getting gradually heated by contact with the alcoholic vapour as it advances from chamber to chamber. As in the lowest of these chambers the heat is greatest, the alcoholic vapour or the condensed spirit contains a large amount of water; but as the chambers are successively cooler, the alcoholic vapour and condensed spirit at last arrive at a temperature only sufficient to convert spirit of the strength wished into vapour, and by an adaptation of valves, and substituting an impervious partition for the perforated plate, and admitting the alcoholic vapour into the chambers cooled by the passage of the cold wash in its contained pipes, that spirituous vapour is condensed, and the spirit is drawn off at one operation, of the very strength which it ought to have, and of the utmost purity.

The flat-bottomed stills are considered the best for the distillation of malt spirit, as by them the flavour is preserved. Coffey's still, on the other hand, is the best for the distillation of grain spirit, as by it a spirit is obtained almost entirely destitute of flavour, and of a strength varying from 55 to 70 per cent. overproof. Spirit produced of this high strength evaporates at such a low temperature that scarcely any of the volatile oils on which the peculiar flavour of spirits depends are evaporated with it, hence the reason why it is not adapted for the distillation of malt whisky, which requires a certain amount of these oils to give it its requisite flavour. The spirit produced by Coffey's still, is, therefore, chiefly used for making gin and brandy by the rectifiers, or for being mixed with malt whiskies by the wholesale dealers. The old or flat-bottomed stills produce pure spirit at strengths varying from 11 to 45 per cent. overproof.

The distiller from malt should obtain at least two gallons of proof spirit from every bushel of malt used; and whether he procures this quantity or not, the present excise law makes him pay the duty on this quantity. If the yield be higher than this, he pays duty on the quantity produced. On the large scale the highest yield is 20 gallons of proof spirit for every quarter of malt; but 18 or 19 gallons is reckoned a fair average yield. When the yield is so low as 16 gallons per quarter of malt, it shows that the malt has been bad or that the fermentation has been badly conducted.

The maximum quantity of proof spirit obtained on the large scale from raw grain, mixed with from a fourth to an eighth of malt, is 22 gallons from every quarter of grain. From 20 to 21 gallons, however, is reckoned a good average yield in a well-regulated distillery. Mr Sheridan, however, by a particular and expensive process, obtained so high a yield as 28 gallons of proof spirits per quarter of grain. This he effected by getting the whole saccharine matter in the wort thoroughly fermented and converted into alcohol, instead of losing nearly a fifth, as is done by the plans pursued at present. For this purpose he fermented the wash in close tuns, and by attaching to them a powerful air-pump he caused the alcohol to evaporate from the wort nearly as rapidly as it formed. No alcohol being, therefore, left in the wort to arrest the decomposition of the saccharine matter, the fermentation continued until the last particle of sugar was converted into alcohol. His plans, however, were not allowed to come into general use in consequence of the meddling interference of the excise, who do not allow the processes of fermentation and of distillation to be carried on in the same premises during the same day.

In consequence of the alteration in the excise laws, sugar and molasses are now largely used in the distilleries for the manufacture of whisky. They are either used alone, or along with raw grain. From carefully conducted experiments the excise officers estimate that every hundredweight or 112 lbs. of sugar ought to yield $11\frac{1}{2}$ gallons of proof-spirit, and they charge the duty on this supposition. It re-

quires 150 lbs. of molasses to yield the same amount of proof spirit.

The peculiar flavours met with in ardent spirits from different distilleries are given chiefly by the different modes of drying the malt, or rather by the substances used for drying the malt. Thus the peculiar peat smoke flavour of much of the Highland whisky is imparted to it by drying the malt with peats; and the birch oil, or russia leather flavour, by drying the malt with birch wood.

At the end of this article we have appended three instructive tables, which exhibit several important points relative to the manufacture of ardent spirit in this country: the quantities manufactured each year during the last ten years; and the quantities manufactured from malt, from malt and raw grains, from sugar, molasses, &c.

It will render this account more complete if we very shortly notice the other distilled spirits—brandy, gin, rum, &c.

Brandy.—In the wine countries the inferior wines, or those which have been damaged by keeping, as well as the fermented mash of the pressed grapes, are subjected to distillation, and yield an ardent spirit. This spirit is known by the names of *Brandy*, *Eau-de-vie*, *Aguardiente*, &c. As a general rule, brandies are weaker in alcohol than the ardent spirit used in this country. They contain, in fact, more than the half of their weight of water; and, as a necessary consequence, have more flavour from having been subjected to a greater heat, and having more of the flavouring essential oil derived from the husk of the grape carried over with the watery vapour. It is the presence of this essential oil which gives the peculiar flavour to brandies; and the flavour is so different for each kind of brandy, that an experienced dealer can from the flavour alone distinguish the brandies of Cognac, Bordeaux, Armagnac, Naples, &c., from each other. French brandy contains a little acetic acid, acetic ether, and often some astringent matter. Some chemists think that the flavouring matter of the brandies chiefly resides in the extremely small proportions of œnanthic ether and oxyhydrate of amyle, which are met with in all spirits, but seem to have peculiar odours in each. The colour is imparted to brandy by burnt sugar.

Gin.—The Dutch have been long famous for their manufacture of an ardent spirit flavoured with juniper, and known in this country by the names of *Hollands*, *Scheidam*, *Gin*, and *Geneva*; the last being derived from the word "*genièvre*," the juniper berry, and the word gin being a contraction thereof. The distillers at Scheidam seem for the last sixty years at least to have followed very much the same practice in the manufacture of this spirit, most of the accounts published during that period by individuals who have gone over to study the manufacture agreeing in the details.

Generally 112 lbs. of malt of big, weighing about 37 lbs. per bushel, and 228 lbs. of best unmalted rye from Riga, weighing about 54 lbs. per bushel, are mashed in about 100 gallons of water of the temperature of 162°. The tun is then carefully covered and left undisturbed for about two hours. The contents are then well stirred up, when the clearest part of the spent wash of a previous distillation, and as much cold water as will reduce the strength of the wort to about 33 of Dicas's hydrometer, and lower the temperature to about 80° are added. About half a gallon of good yeast is then added; active fermentation is thus excited, the temperature rises to 90°, and the whole is over in two days. The whole wort (grains and all) is then transferred to the still, and the distillation is continued till spirit ceases to come over. A very weak spirit is thus obtained, as used to be the case in this country with the old form of still. This, or the *low wines* as it is termed, is subjected to a second distillation after having mixed with it some juniper berries and hops. Old juniper berries are preferred for this purpose, and they are added in the proportion of 2 lbs. of berries to the 100 gallons of low wines; a quarter pound of salt, and a handful of hops, are often also added. These ingredients give the spirit that peculiar flavour which has led it to be styled genievre—geneva—gin. The quantity of spirit obtained varies from 18 to 21 gallons per quarter of grain, a quantity fully as great as is yielded by the best conducted distilleries in this country.

Rum is the name given to a spirit manufactured in the West Indian Islands from molasses and the skimmings of the sugar boilers diluted with water, then fermented, and distilled. We know nothing about the origin of the word *rum*, or the time at which the manufacture of the spirit commenced. At present the manufacture is chiefly carried on in the islands belonging to Great Britain. Dr Ure states that in Jamaica the wort is made by adding together 120 gallons of molasses, 1000 gallons of the spent wash of a former distillation, 720 gallons of the skimmings of the sugar boilers, and 160 gallons of water; so that there is in the wort nearly 12 per cent. of solid saccharine matter. Other proportions, however, are used, bringing the proportion of saccharine matter up to nearly 15 per cent.; as, for instance, 100 gallons of molasses, 300 gallons of skimmings, 200 gallons of spent wash, and 400 gallons of water. The proportions vary in almost every estate, so that no certain rule can be laid down. The fermentation is in general conducted very slowly (apparently very unnecessarily so), occupying from 9 to 14 days. The saccharine matter is therefore very imperfectly converted into alcohol, and the yield of spirit is usually so low as 115 gallons of proof spirit for every 1200 gallons of wash. On some estates, and depending on the price of sugar in the market, the greater proportion of the sugar is converted into rum; and the same imperfect fermentation being followed, the average yield is said to be only 200 gallons of rum for every 3 hogsheads of sugar, whereas the proportion ought to be very nearly double.

It is from the skimmings, which are rich in aroma, that the peculiar flavour of rum is derived; for it is a curious fact, that sugar and molasses distilled in this country yield a spirit entirely destitute of all rum flavour, and in nothing distinguishable from the ordinary spirit derived from grain. Any depth of colour may be given to the rum by the addition of molasses or caromel, though it is commonly but erroneously stated that the colour of the rum is derived from the oak casks.

A spirit not to be distinguished from the ardent spirit, or whisky, manufactured in this country, is largely prepared on the Continent from the potato, but is purest and freest from peculiar flavour when manufactured from the pure potato starch. In the latter case the starch is previously converted into soluble grape sugar by subjecting it to the action of sulphuric acid, the sulphuric acid being afterwards removed as an insoluble sulphate by the addition of chalk. It is found that 1 lb. of commercial sulphuric acid (vitriol) mixed with 600 lbs. of water will convert 100 lbs. of starch into grape sugar in three hours, if the temperature be raised by pressure to 250°. After the removal of the insoluble sulphate the infusion is fermented and distilled, and yields a spirit of great purity.

(J. H—K.)

DISTINCTION, in *Logic*, an assemblage of two or more words, by means of which disparate things or their conceptions are denoted.

DISTRAIN, to make seizure of goods for debt. See DISTRESS.

DISTRESS, in its ordinary acceptation, denotes calamity, misery, or suffering.

DISTRESS, in *English Law*, the seizing or distraining of the cattle or goods of an alleged defaulter or wrong-doer, for the purpose of compelling him (through the inconvenience or loss resulting from such procedure) to perform the act in which he is a defaulter, or to make compensation for the wrong which he has committed.

The most usual injury for which a distress is resorted to is the non-payment of rent, including rents-seck, rents of assize, and chief rents, as well as rents reserved upon lease. Distress is also resorted to for damage done (*damage feasant*), as when injury is sustained from cattle or goods being wrongfully upon property, and causing damage there, either by treading down grass or the like, or by merely incumbering such property. It may also be taken for neglecting to do suit to the lord's court, or other certain personal service, for amercements in a court leet, and also for the several duties and penalties imposed by special acts of parliament, for the relief of the poor, &c.

All chattels personal, as a general rule, are liable to be distrained, with the following exceptions: animals *feræ naturæ;* whatever for the time is in the *personal* use or occupation of a man; things delivered to a person exercising a public trade, to be carried, wrought, or managed for his customer; things in the custody of the law; whatever cannot be returned in as good condition as when distrained; fixtures; growing corn; beasts used at the plough; the instruments of a man's trade or profession, provided a sufficient distress can be found otherwise.

The effect of this distress is to compel the party either to institute an action against the distrainer, or to oblige him to make satisfaction for the debt or duty for which the distress was made; and in statute distresses, and under various acts of parliament, in distresses for rent, a power of sale is given, after notice, to effectuate the remedy. (R. M—M.)

In Scotch law the term equivalent to distress is poinding. The word *distress* is, however, colloquially used in Scotland in the same sense as in England, and it is frequently the term made use of in revenue and other statutes for the seizure of a defaulter's goods.

DISTRIBUTION, the act of dividing among numbers: a dealing into parts or portions: the division and disposition of the parts of anything; as the parts of a building, according to a plan or the rules of art.

In *Rhetoric*, it denotes a kind of description by which a division and enumeration are made of the several qualities

of a subject;—as "Their throat is an open sepulchre; they flatter with their tongues; the poison of asps is under their lips; their mouth is full of cursing and lies; and their feet are swift to shed blood."

In *Printing*, it signifies the taking a form asunder, separating the letters, and disposing each in its proper compartment in the cases.

DISTRINGAS, in *Law*, was a writ commanding the sheriff or other officer to distrain a person for debt to the king, &c., or for his appearance at a certain day; and it was necessary, in order to enable a plaintiff to enter an appearance for the defendant in an action, whereon to proceed to judgment and execution. This proceeding is now abolished by sect. 24th of the 15th and 16th Vict., cap. 76, and the plaintiff, upon affidavit showing efforts to serve the writ of summons, &c., may obtain an order to proceed as if personal service had been effected. The process against a body corporate is, however, still by *distringas* in the Court of Chancery.

DISTRINGAS, *Juratores*, a writ directed to the Sheriff, by which he commanded to distrain upon a jury to appear and to return issues on their lands, &c., for non-appearance. This writ of *distringas judicatores* issues for the sheriff to have their bodies in court at the return of the writ, or to distrain them by their lands and goods. This writ is now abolished by the 15th and 16th Vict., cap. 76, sec. 104, and the jurors are summoned for the commission day in virtue of a precept issued to the sheriff by the judges of assize.

Formerly also, in an action of detinue after judgment, the plaintiff was entitled to a distringas to compel the defendant to deliver the goods by repeated distresses of his chattels; but now, under the 17th and 18th Vict., cap. 125, sec. 78, the court is empowered to order the specific delivery of chattels. (R. M—M.)

DITCH, a trench made in the earth by digging, either for an inclosure or for draining land.

In *Fortification*, otherwise called *fosse*, and *moat*, a trench dug round the rampart or wall of a fortified place between the scarp and counterscarp.

DITHYRAMBUS, in *Ancient Poetry*, a hymn in honour of Bacchus, full of transport and poetical rage.

This kind of poetry owes its birth to Greece, and to the transports of wine. Horace and Aristotle tell us that the ancients gave the name to those verses in which none of the common rules or measures were observed. Of this species of writing we have no remains.

DITONE, in *Music*, an interval of two whole tones, or a major third.

DITRIHEDRIA, in *Mineralogy*, an old term expressive of crystals with *twice three sides* or six planes, and which are formed of two trigonal pyramids joined base to base without an intermediate prism or column.

DITTEAH, a town and fortress of Hindustan, province of Bundelcund. It is populous and well built, about a mile and a half long, and nearly as much in breadth. The houses are chiefly constructed of stone, and covered with tiles. It is surrounded by a stone wall, and furnished with gates. Without the town is the rajah's palace, standing on an eminence, and commanding a very extensive prospect, including a fine lake. It is an ancient place, having been in the rajah's family for several centuries. The raj or territory of which Ditteah is the chief place, lies between Lat. 25. 32.—26. 18.; Long. 78. 15.—78. 54. Area, 850 square miles; pop. 120,000. The rajah pays no tribute. He maintains a military force of 5000 infantry and 1000 cavalry. On the cession of Bundelcund by the peishwa to the British in 1804 the rajah of Ditteah joined the British standard, and a treaty was concluded with him, by which he was confirmed in the possession of his ancient inheritance. The town of Ditteah is distant N.W. of Calcutta 755 miles. Lat. 25. 40.; Long. 78. 31 (E. T.)

DITTO, contracted into Do. in books of accounts, &c., is a corruption of the Italian *detto*, *i.e. the said*, and signifies *the aforesaid*, or *the same*.

DITTON, HUMPHRY, an eminent mathematician, was born at Salisbury, May 29, 1675. At his father's request he entered on the study of theology, and was for some years a dissenting minister at Tunbridge, where he married. On the death of his father, however, he was induced to relinquish the clerical profession; and at the persuasion of Mr Whiston and Dr Harris he devoted himself to the more genial study of mathematics. Through the influence of Sir Isaac Newton, he was elected mathematical master in Christ's Hospital, where he continued till his death in 1715.

Ditton was the author of the following treatises:—*Of the Tangents of Curves*, &c., *Phil. Trans.* vol. xxiii.; *A Treatise on Spherical Catoptrics*, published in the *Phil. Trans.* for 1705, from which it was copied and reprinted in the *Acta Eruditorum*, 1707, and also in the Memoirs of the Academy of Sciences at Paris; *General Laws of Nature and Motion*, 8vo, 1705. (Wolfius commends this work, as illustrating and rendering easy the writings of Galileo, Huygens, and the *Principia* of Newton. It is also noticed by La Roche, in the *Mémoires de Littérature*, vol. viii. p. 46.) *An Institution of Fluxions, containing the first Principles, Operations, and Applications of that admirable method, as invented by Sir Isaac Newton*, 8vo, 1706. In 1709 he published the *Synopsis Algebraica* of John Alexander, with many additions and corrections. In his *Treatise on Perspective*, published in 1712, he explained the mathematical principles of that art; and anticipated the method afterwards elaborated by Dr Brook Taylor. In 1714 Ditton published his *Discourse on the Resurrection of Jesus Christ*; and *The New Law of Fluids, or a Discourse concerning the Ascent of Liquids in exact Geometrical Figures, between two nearly contiguous Surfaces*. To this was annexed a tract to demonstrate the impossibility of thinking or perception being the result of any combination of the parts of matter and motion; a subject much agitated about that time. There was also added an advertisement from him and Whiston concerning a method for discovering the longitude, which it seems they had published about half a year before. This attempt probably cost our author his life. Although approved by Sir Isaac Newton before being presented to the Board of Longitude, and the method had been successfully practised in finding the longitude between Paris and Vienna, the board determined against it. This disappointment, together with some sarcastic lines written by Dean Swift, affected Ditton's health to such a degree that he died in the following year.

In an account of his life, prefixed to the German translation of his Discourse on the Resurrection, it is said that he had published, in his own name only, another method for finding the longitude. This Whiston denied. However, Raphael Levi, a learned Jew, who had studied under Leibnitz, informed the German editor that he well knew that Ditton and Leibnitz had corresponded upon the subject; and that Ditton had sent to Leibnitz a delineation of a machine he had invented for that purpose, and which Leibnitz highly approved of for land use, but doubted whether it would answer on board a ship on account of the motion.

DIU, a once celebrated island and fortress of Hindustan, in the peninsula of Kattywar. It is $6\frac{1}{2}$ miles long by $1\frac{1}{2}$ broad, is nearly barren, and contains no good water, excepting what is collected in ponds during the rainy weather. In 1515 the Portuguese gained possession of Diu. They immediately commenced fortifying it, and in ten years rendered it impregnable against all the powers of India. It soon became a place of great trade and commerce, and was the harbour in which the fleets were laid up in winter. But with the decline of the Portuguese power it fell into decay, and was plundered by the Arabs of Muscat in 1670. It

has since dwindled into insignificance, and has now little or no commerce. The trade in slaves formerly carried on in this island has been discontinued under orders from the Portuguese government in Europe. E. Long. 71.; N. Lat. 20. 43. (E. T.)

DIVAL, in *Heraldry*, the herb nightshade, used for sable or black by such as blazon by flowers and herbs instead of colours and metals.

DIVALIA, in *Antiquity*, a festival celebrated by the Romans on the 21st of December, in honour of the goddess Angerona; whence it was called *Angeronalia*. On this day the pontifices performed sacrifices in the temple of Volupia, the goddess of pleasure, who, according to some, was the same as Angerona.

DIVAN (Arabic *diwan*), among the Arabs, Persians, and Turks, is a word that bears very various significations. It primarily denoted a book of accounts, a muster-roll of troops, &c.; and hence came to be applied to a collection of lyric poems (called *gazelles*) arranged in a kind of alphabetical order. Thus we have the *Diwan of Sadi*, the *Diwan of Hafiz*, &c.; a practice which has been imitated by Goethe in his *Westöstlicher Divan*—a collection of poems in the Oriental style. The word among the Orientals denotes also a council-chamber, a tribunal of justice, and in like manner is applied to the general council of state. Under the khaliffs of Baghdad, the diwan was a court of justice over which the khaliff presided in person. At Constantinople in the present day the term is used to denote the great council of the empire. It is also a common appellation among the Turks for a saloon or chamber of reception, or in which business is transacted, or used as a place of occasional repose. The divan more properly is a kind of stage, raised about a foot above the floor of the saloon, covered with rich tapestry, and furnished with a number of embroidered cushions leaning against the wall; and on this the master of the house is seated when he receives visitors. Hence the word is frequently applied by other nations to a kind of public coffee-room, furnished in a manner somewhat similar.

DIVERGENT or DIVERGING, separating or receding from each other, as lines which proceed from the same point; a term of frequent use in mathematics and optics. It is opposed to convergent. A convex lens renders the rays of light convergent; a concave lens, divergent. A convex mirror makes the rays diverge; a concave one, converge. A diverging series in mathematics is a series of which the terms increase more and more the further it is continued.

DIVERSIFYING, in *Rhetoric*, a mode of varying a subject, which may be done, says Vossius, in the six following ways: 1. By enlarging on what was briefly mentioned before; 2. by a concise enumeration of what had been insisted on at length; 3. by adding something new to what is repeated; 4. by repeating only the principal heads of what had been said; 5. by transposing the words and periods; 6. by imitating them.

DIVERSION, in *War*, the act of drawing the attention and troops of the enemy from the point where the principal assault is intended to be made, by an attack or alarm in another quarter.

DIVESTING signifies literally the stripping off a vestment or garment, in contradistinction to investing. In law it is used for the act of surrendering or relinquishing one's effects.

DIVIDIVI, the commercial name of the pod of the *Cæsalpinia coriaria*, which is pretty extensively used for its astringent qualities in tanning, and also as a mordant in dyeing. It yields a large quantity of tannin.

DIVINATION, a general term descriptive of the various illusory arts anciently practised for the discovery of things secret or future. In those countries and ages where ignorance of physical laws has combined with superstition to debase the human mind, it has sought to gratify its innate disposition to pry into futurity by looking for presages in things between which and the object of its anxiety no connection existed but in the diviner's imagination. Scarcely a single department of nature but was appealed to, as furnishing, on certain conditions, good or bad omens of human destiny; and the aspect of things, which, perhaps by the most casual coincidence, marked some event or crisis in the life of one or two individuals, came to be regarded as the fixed and invariable precursor of a similar result in the affairs of mankind in general. By such childish and irrational notions was the conduct of the heathen guided in the most important, no less than in the most ordinary occurrences of life; and hence arose the profession of augurs, soothsayers, *et hoc genus omne* of impostors, who, ingrafting vulgar traditions on a small stock of natural knowledge, established their claims to the possession of an occult science, the importance and influence of which they dexterously increased by associating it with all that was pompous and imposing in the ceremonies of their religion.

This pretended science was divided into various branches, each of which had its separate professors. In a general view, divination may be considered as either natural or artificial; the first being founded on the notion that the soul possesses, from its spiritual nature, some prescience of futurity, which it exemplifies particularly in dreams, and at the approach of death: the second, resting on a peculiar interpretation of the course of nature, as well as on such arbitrary observations and experiments as superstition introduced. The different systems and methods that were anciently in vogue are almost incredible; as, for instance, Aëromancy, divining by the air; Arithmomancy, by means of numbers; Capnomancy, by the smoke of sacrifices; Chiromancy, by the lines on the palms of the hands; Hydromancy, by water; Pyromancy, by fire, &c. It is beyond our limits to enter upon the enumeration and explanation of the various arts of divination that were practised by the ancients. These the reader, curious in such inquiries, will find detailed at length by Cicero (*De Divinatione*), and Cardan (*De Sapientiâ*).

Egypt, the cradle of arts and sciences, if she did not give it birth, seems to have encouraged the practice of divination at an early age; and it is well known that at the time of the Hebrew exodus there were magicians in that country whose knowledge of the arcana of nature, and dexterity in the practice of their art enabled them, to a certain extent, to rival the miracles of Moses. By what extraordinary power they changed their rods into serpents, the river into blood, and introduced frogs in unprecedented numbers, is an inquiry that has perplexed many learned men. Some have ascribed their performances to jugglery and legerdemain; the serpents, the frogs, &c., having been secretly provided and dexterously produced at the proper moment. Others prefer the supposition that these conjurors were aided by infernal agents, with the Divine permission, in the performance of their wonderful feats. See DÆMON.

But it was Chaldæa to which the distinction belongs of being the mother-country of diviners, and especially of judicial astrologers. Such a degree of power and influence had they attained in that country, that they formed the highest caste and enjoyed a place at court; nay, so indispensable were they in Chaldæan society, that no step could be taken, not a relation could be formed, a house built, a journey undertaken, a campaign begun, until the diviners had ascertained the lucky day and promised a happy issue.

DIVINE, pertaining to the true God; or to a false god among the heathens. The word is also applied figuratively to anything superexcellent, extraordinary, or that seems to surpass the power of nature and the capacity of man.

DIVING.

DIVING is the art of descending under water to considerable depths, and of remaining there some time, so as to be able to collect valuable, articles, such as pearls, sponges, coral, and other submarine productions, from the bottom of the sea or rivers, or property from the sunken wrecks of vessels.

Difficulties of diving, from want of air in the lungs.

This art is one of great utility, but is attended with peculiar difficulties, owing to the very limited powers which man naturally possesses within the liquid element. On the surface he may no doubt continue a long time floating or swimming, and hence arises the wonderful art of navigation. But the moment he plunges within the mass he is cut off from the vital air, and life is speedily extinguished. The necessity of a constant supply of air for the support of life is shown by simply attempting to withhold it by shutting the mouth and nostrils. No one can continue holding in the breath in this manner much longer than a minute or a minute and a half. If we begin to hold after having made an expiration, we cannot do it longer than a quarter of a minute; but if we take a large inspiration, and fill the lungs, this supply is found to last longer; so that we can readily hold breath a full minute, and, with practice and great exertion, some may even continue to do so two minutes. Now this is exactly what the diver must do to remain alive under water; and accordingly we find that in general a person cannot remain longer than half a minute without the danger of suffocation, and the most practised divers not above two minutes; such is the necessity for fresh air continually present in the lungs.

Necessity of air, cause of.

The nature and cause of this necessity for air has been illustrated by the discoveries of modern chemistry. These have proved that it arises from a certain chemical action which the atmosphere exerts on the blood as it passes through the lungs, and which is continually going on, and cannot for a moment be intermitted. The nature of this action is not yet exactly understood, but the object of it undoubtedly is to purify the blood, as it becomes vitiated by circulating through the system. For this purpose, the air inspired into the lungs, and coming there into contact with the blood, imparts to it its oxygen, a small portion of which is supposed to combine with the blood, and to give it renewed vigour; but by far the greater portion combines with the carbonaceous matter of the blood, and carries off this impurity in the shape of carbonic acid at each expiration. This is proved by a very simple experiment. Let a person, for instance, respire by means of a pipe into a bag or bladder of air of the capacity of a gallon or more; he will breathe freely enough at first, but in a very short time with great difficulty, and at last will feel the sense of suffocation the same as in holding the breath in the ordinary way. If the air in the bladder be now examined, it will be found to have entirely changed its nature; it will no longer support the flame of a candle, but extinguish it the moment it is immersed, thus showing the loss of oxygen. Hence arises that sense of closeness and oppression which is felt in crowded assemblies, where, as generally happens, the ventilation is imperfect. The same air being breathed again and again, becomes unfit for respiration, and produces those unpleasant sensations which are usually felt. A very curious and interesting set of experiments on respiration were made by Messrs Allen and Pepys, and narrated in the *Philosophical Transactions* for 1808. The following bears particularly on the present subject.

"Three hundred cubic inches of common air contained in one of the mercurial gasometers were respired. In less than a minute it became necessary to take deeper and deeper inspirations, and at last the efforts were so violent that the glass was in danger of being broken. A great sense of oppression and suffocation was now felt in the chest, vision became indistinct, and after the second minute the attention of the operator seemed to be withdrawn from surrounding objects, and fixed upon the experiment. A buzzing in the ears took place, as in breathing nitrous oxide; and after the third minute there was left only sufficient recollection to close the gasometer after an expiration; after which he became insensible, having made thirty-five inspirations. The expired air contained ten per cent. of carbonic acid, four of oxygen, and eighty-six of azote."

Quantity of air necessary; mode of increasing.

With 300 cubic inches of air, then, in the gasometer, the operator began to be insensible in the space of two minutes; and if we suppose that the lungs, which were in their natural state at the commencement of the operation, contained 100 cubic inches of atmospheric air, then it would follow that 200 inches each minute would be necessary to support life, so as to remain at the same time quite sensible. Hence, supposing the lungs to contain, with a full inspiration, 250 cubic inches, which is a pretty large allowance, it would follow that a man might hold breath, or remain under water, a minute and a quarter, which agrees very well with what occurs in ordinary cases. But a very curious fact has been mentioned to us by Professor Faraday of the Royal Institution, London, and was first noticed to him by a gentleman connected with the Asiatic Society, a fact which may often be of great importance, not only in diving, but in cases of fire, and of accidents in brewers' vats, &c. The lungs in their natural state are charged with a large quantity of impure air, being a portion of the carbonic acid gas which is formed during respiration, but after each expiration still remains lodging among the involved passages of the pulmonary vessels. In proof of this, it is only necessary to breathe by a small pipe, or roll of paper, into a common water bottle, throwing away the first portion of the expiration, and propelling the last into the lower parts of the vessel. Then insert this over a taper, and it will be instantly extinguished. Now, by breathing hard for a short time, as one does after taking any violent exercise, this impure air is expelled, and its place is filled up with atmospheric air. The consequence is, that if we then take a full inspiration, the breath can easily be held for two minutes. This experiment any one can make. On trying it in the ordinary way, we could hold breath for about three quarters of a minute, but this with great difficulty. We then made eight to ten forced respirations, and on closing the mouth and nostrils felt no inconvenience even on the first trial, till after a minute and a half, but continued, however, to the end of the second minute. The knowledge of this fact might be of essential use in diving, and, we have no doubt, might often be the means of saving life; for if in the ordinary way we can only remain a single minute under water, of what importance is it to be capable of doubling the time? A single minute in these cases must be invaluable. Whether the professed divers are aware of this circumstance or not, we do not know; but it is probable, at any rate, that in many cases the exertion induced by swimming may have the effect of clearing the lungs. Another curious fact illustrative of the same principles occurred to Mr Bruneli in descending to examine the breach which the river had made in the Tunnel under the Thames. Having lower-

Diving.

ed the diving-bell nearly thirty feet to the mouth of the opening, this was found too narrow to admit the bell, so that no further observation could be made on the state of the Shield and other works, which were perhaps eight or ten feet deeper. Brunell, therefore, laying hold of the end of a rope, left the bell, and dived himself down the opening; his companion in the bell being alarmed at the length of his stay, now about two minutes, gave the signal for pulling up; and the diver, unprepared for the signal, had hardly time to catch hold of the rope which he had let go, and was surprised on coming up to find that so much time had elapsed. On descending again, he found that he could with ease remain fully two minutes under water. The reason evidently was, that the atmosphere in the bell being condensed by a column of water nearly thirty feet in height, contained nearly double the quantity of air in the same bulk, and thus nearly a double supply in the lungs.

Difficulty from the pressure of the water.

Besides the difficulty of holding the breath, another arises in diving, particularly at considerable depths, from the external pressure of the fluid on the chest, and on every cavity of the body. On the chest this tends to compress it together, and to expel the air out of it, and thus increases greatly the difficulty of holding the breath. At each foot of descent this pressure will increase upwards of sixty lbs. on every square foot of the body; and if we suppose the chest to expose half a square foot, we have, at the depth of fifteen feet, a force equal to the weight of 450 lbs. loading the chest, and tending to propel the included air. A very great muscular exertion, therefore, will evidently be required to resist this enormous strain; nor is it practicable, by any breastplate or other contrivance, to defend the chest from this pressure, as this, to do any good, would require to be so large, and of such strength, as greatly to obstruct the free motions of the diver. It is this pressure of the deep water, and the violent exertion necessary to overcome it, that causes, in divers who go down frequently, the eyes to become blood-shot, and brings on a spitting of blood.

Marvellous accounts of divers.

The art of diving having always in it, and particularly during the infancy of science, something of the marvellous, the most extraordinary accounts have been given, by different authors, of the feats of some of the most noted divers. The most singular of these is that given by Kircher, of the Sicilian diver *Nicolo Pesce*, taken, as he states, from the archives of the kings of Sicily.

Sicilian diver.

"In the times of Frederick king of Sicily," says Kircher, "there lived a celebrated diver, whose name was *Nicholas*, and who, from his amazing skill in swimming, and his perseverance under water, was surnamed the *fish*. This man had from his infancy been used to the sea, and earned his scanty subsistence by diving for corals and oysters, which he sold to the villagers on shore. His long acquaintance with the sea at last brought it to be almost his natural element. He was frequently known to spend five days in the midst of the waves, without any other provisions than the fish which he caught there, and ate raw. He often swam over from Sicily into Calabria, a tempestuous and dangerous passage, carrying letters from the king. He was frequently known to swim among the gulfs of the Lipari islands, noway apprehensive of danger.

"Some mariners out at sea one day observed something at some distance from them, which they regarded as a sea monster; but upon its approach it was known to be Nicholas, whom they took into their ship. When they asked him whither he was going in so stormy and rough a sea, and at such a distance from land, he showed them a packet of letters which he was carrying to one of the towns of Italy, exactly done up in a leather bag, in such a manner as that they could not be wetted by the sea. He kept them thus company for some time in their voyage, conversing and asking questions; and after eating a hearty meal with them, he took his leave, and, jumping into the sea, pursued his voyage alone.

"In order to aid these powers of enduring in the deep, nature seemed to have assisted him in a very extraordinary manner; for the spaces between his fingers and toes were webbed, as in a goose; and his chest became so very capacious that he could take in, at one inspiration, as much breath as would serve him for a whole day.

"The account of so extraordinary a person did not fail to reach the king himself, who commanded Nicholas to be brought before him. It was no easy matter to find Nicholas, who generally spent his time in the solitudes of the deep; but at last, after much searching, he was found and brought before his majesty. The curiosity of this monarch had been long excited by the accounts he had heard of the bottom of the Gulf of Charybdis; he now therefore conceived that it would be a proper opportunity to have more certain information. He therefore commanded our poor diver to examine the bottom of this dreadful whirlpool, and, as an incitement to his obedience, he ordered a golden cup to be flung into it. Nicholas was not insensible of the danger to which he was exposed, dangers best known only to himself, and therefore he presumed to remonstrate; but the hopes of the reward, the desire of pleasing the king, and the pleasure of showing his skill, at last prevailed. He instantly jumped into the gulf, and was as instantly swallowed up in its bosom. He continued for three quarters of an hour below, during which time the king and his attendants remained on shore anxious for his fate; but he at last appeared, holding the cup in triumph in one hand, and making his way good among the waves with the other. It may be supposed he was received with applause when he came on shore; the cup was made the reward of his adventure; the king ordered him to be taken proper care of; and, as he was somewhat fatigued and debilitated by his labour, after a hearty meal he was put to bed, and permitted to refresh himself by sleeping."

The diver then, according to the account, gave a narrative of the wonders he had seen, which so excited the curiosity of the monarch, that he again tempted the diver to a second and fatal descent. After plunging into the whirlpool, he was never more heard of.

Authentic statements of the power of divers.

But to return to more authentic statements, these on the whole agree very well with the views already stated. Among the pearl divers at Ceylon and other parts of the East, instances have been known of a diver remaining six minutes under water; but these are very rare; the ordinary time seldom exceeds a minute, and sometimes it is a minute and a half, or two minutes. There are generally ten divers in each of the boats belonging to the fishery; five descend into the sea at a time, and the other five remain above to recruit their strength. In order to hasten their descent, a large stone is used, with a rope attached to it, which the diver seizes with the toes of his right foot, while he grasps a bag of net-work with those of the left. He then seizes another rope with his right hand, and keeping his nostrils shut with his left, plunges into the water, and soon reaches the bottom. Then hanging the net round his neck, he speedily collects the oysters, and resuming his former position, he makes a signal to those in the boat, and is immediately hauled up, and the stone which assisted his descent is pulled up afterwards.

The divers are all Indians, who are accustomed to this seemingly dangerous occupation from their infancy, and who fearlessly descend to considerable depths. They will frequently make from forty to fifty plunges in a day; but the exertion is so extremely violent, that in coming up they

Diving.

discharge water, and sometimes blood, from their mouths, ears, and nostrils. Some of them rub their bodies with oil, and stuff their ears to prevent the water from entering; but the greater part use no precautions whatever. They take no food while in the boats, nor till they return on shore and have bathed themselves in fresh water. The only danger to which they are exposed is from meeting, while at the bottom, with the ground-shark, which is a common inhabitant of those seas, and of which the divers are under dreadful apprehensions; some of them indeed are so expert as to avoid this enemy, even when they remain under water for a considerable time; but the uncertainty of escaping is so great, that, in order to avert the danger, they consult, before they begin, their priests or conjurors, in whom they place implicit confidence.

Florida Indian divers.

Dr Halley relates, as a remarkable circumstance, that he observed a Florida Indian diver at Bermudas, who could remain two minutes under water. He states, that the divers for sponges in the Archipelago are in the practice of taking down in their mouths a piece of sponge dipped in oil, and by this are enabled to dive longer than others who have none. It is not easy to conceive how this can assist the diver's breathing; for the introduction of any foreign substance into the mouth must necessarily diminish the quantity of air he can take down. But it has been lately said that the real object of taking oil in their mouth is to calm those small waves on the surface of the sea which prevent the light being so steadily transmitted to the bottom as is necessary to enable the divers to find the small objects they search for without delay. By ejecting a little oil from their mouths, it rises to the surface, and spreading upon it, calms the waves in a most remarkable manner, and gives a brilliant light at the bottom.

Use of sponges.

South Sea divers.

Many nations, and particularly the savages in the South Sea and other islands, are remarkable for the expertness they acquire by habit in diving and moving about in the water. Being accustomed to it from their infancy, the element becomes so natural to them that they seem to have the use of all their faculties in the water the same as on the dry land. According to the accounts of voyagers, they are such expert divers, that when a nail or other piece of iron was thrown overboard, they would instantly jump into the sea after it, and never fail to recover it. On one occasion a smith's anvil is said to have fallen overboard. Not being able to bring this up, the islanders notwithstanding contrived to bring it ashore, by descending a great many times to the bottom, and rolling it over and over till it reached the land.

Apparatus for aiding the divers.

Such is the length to which diving has been carried by the natural powers of the body alone. But from the curious and difficult nature of the object, and the many important purposes to which the art might be employed, ingenious men were led to the invention of various contrivances for the use of the diver, which have greatly extended his powers and the usefulness of the art. A multitude of these contrivances of different descriptions have been brought forward by mechanical projectors for the last two hundred years. They all resolve themselves into three different kinds.

1*st*, Water-tight armour or dresses for the body, so strong as to protect it from the external pressure of the fluid; and, along with this, the means of supplying the diver with fresh air, so as to enable him to remain any time under water.

2*dly*, Water-tight vessels of metal for inclosing the diver, and of such capacity as to contain a supply of air for a limited period of perhaps half an hour or an hour or more, and giving him also the use of his hands and arms externally by a sort of flexible sleeves.

3*dly*, The diving-bell, which, from its simplicity, safety, and perfect efficiency, has now almost entirely superseded every other, though there is no doubt that in many cases these may still be of considerable utility in subservience to the bell.

Diving.

Water-tight armour.

In regard to dresses or armour, a number of different plans of this kind are detailed in Leopold's *Theatrum Machinarum Hydraulicarum*. At depths of twelve or fifteen feet these may often be of essential use; but beyond this they become inapplicable, owing to the great pressure on the limbs of the diver, which must either be exposed, or covered only with a flexible material, not to impede his motions; and in that case the pressure, acting on all sides like a ligature, is liable to obstruct the circulation of the blood in the limbs, and to drive it from these into those parts of the body within the armour, causing extreme pain. In any great depth, also, the necessary strength of the armour renders it unwieldy; and it is extremely difficult, if not impracticable, to fit it tightly on every part; while the smallest opening, by admitting water, may endanger the life of the diver.

Klingert's armour.

One of the best of these contrivances is perhaps that proposed by M. Klingert, and described in a pamphlet published at Breslau in 1798. The harness or armour is made of strong tin-plate, in the form of a cylinder, with a round end to inclose the head and body, and, for the convenience of putting it on, is made in two parts, the head-piece or helmet, and the body. Besides this, there is a leather jacket, with short sleeves, and a pair of drawers of the same, which are made water-tight, buttoned on the metal part where they join, and made tight with brass hoops, going round the leather and the metal upon the outside. The chief peculiarity in this machine is the mode in which fresh air is supplied, and respiration effected. This is done by two distinct flexible pipes proceeding from the inside of the helmet to the surface of the water; the one is for inhaling the air, and terminates in an ivory mouth-piece, which the diver may embrace with his lips and inhale the air; the other enters the helmet at the same place, and opens merely into the inside of the machine, so as to allow the foul air to be discharged. The diver, therefore, draws in the fresh air by the mouth, and discharges it into the helmet by the nostrils; and from the interior of the machine it is propelled by the act of inspiration, the expansion of the chest contracting the space between it and the armour, and forcing out exactly as much air as is drawn in, keeping up always a due equilibrium. This is certainly a very ingenious arrangement; for, if there were no second pipe to discharge the air, the expansion of the chest would compress the air round the body of the diver, and, unless this were of large capacity, which would be inconvenient, would create a difficulty in the operation. The construction of the apparatus will be understood from the drawing, fig. 1, Plate III., which is a front view of the diver, and by the following description: A is the helmet-piece, fifteen inches in height, and the diameter adapted to the size of the body of the diver; BB is the lower part of the cylinder, of the same diameter, and of such a height as to meet the other at the dotted line C; *dd*C is the jacket, and *ff*E the drawers; these are attached to the cylinder by buttons, as seen; and *a*, *a*, *bb* are the three brass hoops fitted over each joint to make it water-tight; the hoops are made of brass-plate, with their ends turned up, and fitted with screws, by means of which they can be drawn very tight upon the leather. The cylinder has holes for the arms, one half in the upper piece and one half in the lower; and when the jacket is fastened on, it binds the upper and lower parts of the cylinder together. It is fastened at the arms with brass screw hoops, *dd*, and the

Diving. drawers by similar ones at *ff*; *k h* represent the breathing pipes, the first for drawing in the air, the second for discharging it; these are united to a little metal cylinder, which screws on the helmet at the aperture *g*; this is shown more particularly at fig. 2, where a partition will be observed in the cylinder dividing the fresh air compartment from the other, the one terminating in the ivory mouth-piece *v*, the other just entering the machine at *t*. W is a small reservoir at the lower part of the pipes, for condensing any air, or receiving what may penetrate through the pipes. To resist the external pressure of the water on the limbs, the leather drawers have a framing of iron within them, represented at fig. 3; this consists of a semicircular piece *ll*, also seen at *ll*, fig. 1, extending between the legs of the diver, and fastened to the lower extremity of the cylinder at the front and back; also two irons *nn* outside the thighs, which are jointed to the cylinder, and extend down to *f*, where they are attached to a hoop surrounding the thigh; there is another hoop for each thigh farther up at *q*; these hoops are farther connected by irons, which at the upper end are fitted to slide upon the semicircular hoop, as at *t*; and by this means, though the frame-work is very strong, the diver is at liberty to walk. *ww* are weights hooked on the cylinder, to keep the diver down. P is a small pump for discharging any leakage water which may penetrate through the joints.

When the different parts of the machine have been fitted to the body of the diver, and the proper weights are attached, he enters the water till it rises as high as his eyes, while the end of the pipe is held by an assistant above the surface; and if he finds that he can breathe freely, and no water is forced into the pipe, he may venture to go deeper; and, stopping for some time, to ascertain whether respiration be not inconvenient from the want of fresh air, he may advance to still greater depths, while he makes the proper signals by means of the rope which is secured to one of his arms, or by speaking through the pipe. By this kind of exercise for some time, the diver acquires confidence and ease for conducting the necessary operations. When he is desirous of ascending he has only to unhook the weights attached to the apparatus, or to fix them to a rope let down for the purpose, that they may not be lost, and as he is then lighter than the same bulk of water, he rises to the surface.

By following these directions, any one may be able to use the apparatus, and dive to moderate depths, in a very short time. In one of the trials upon the Oder, near Breslau, the diver was a huntsman taught by the author; the water was of considerable depth, and the current strong, and there were a great number of spectators present. He sawed through the trunk of a tree which was lying at the bottom; he showed also that he could have fastened sunk bodies to a rope in order to be drawn up, and that in case any impediment should prevent the use of the saw, the trunks of trees might be hewed to pieces by an axe. On the whole, this apparatus, or one similar, might certainly be of great use in many cases, particularly in hydraulic works, where the diving-bell and the machinery connected with it might not be attainable. The water-proof cloth of Mackintosh might also be substituted with good effect for the leather.

Apparatus by Tonkin. Another mode of supplying air to the diving apparatus has been adopted in some cases. This consists in forcing the fresh air into the machine by a bellows or pump, till its elastic force is equal to the pressure of the water. The foul air may in this case be suffered to escape into the water through a valve, or may be conducted to the surface by a pipe. Of this kind is the apparatus contrived by Mr Tonkin, and employed for some time in raising parts of the wreck of the Abergavenny East India ship, which was unfortunately lost off Weymouth in 1804. It consisted of a body of copper with iron boots, put together and jointed in the manner of coats of mail; the whole is then covered with leather, and afterwards with canvass to distinguish it under water. The arms are made of strong water-proof leather; and the place for sight is about eight inches diameter, glazed over with a plate of glass an inch thick. The diver is sunk in this machine by means of weights, fastened equatorially round the waist of it; and he is suspended by a rope, by means of which his situation is changed at pleasure. A flexible air-tube communicates with an air-vessel in the boat above. Through this tube the diver gives his instructions and obtains his supply of fresh air. This machine was used with very good effect in a depth of water of near seven fathoms, and enabled the diver to direct the operations of several curious machines, such as saws for clearing away the ship's decks, and making sufficient openings to give him access to the treasure below, as well as tongs, &c. for taking up the heavy goods by tackle in the vessel above.

Borelli's diving bladder. In regard to the second kind of diving machines, that proposed by Borelli is only curious as showing the low state of physical knowledge in his time. He proposed to have a copper vessel, or vesica as he terms it, about two feet diameter, to contain the diver's head, and to be fixed to a habit of goat skin for the body. Within the vessel there were pipes contrived to produce a circulation of air, by which Borelli supposed that the objections to other diving machines from the want of air would be obviated; "the moisture," as he says, "by which it is clogged in respiration, and by which it is rendered unfit for the same use again, being taken from it by its circulation through the pipes, to the sides of which it would adhere, and leave the air as free as before." It also contained an air-pump, by means of which the diver could raise or lower the apparatus, by condensing or rarefying the air, on the principle of the air-bladder of fishes.

Leather diving chest. Mr Martin, in his *Philosophia Britannica*, mentions an apparatus contrived by an Englishman, consisting of strong leather, so prepared that no air could pass through. It fitted to his arms and legs, and had a glass window placed in the fore part of it. When dressed in this apparatus, which was large enough to contain half a hogshead of air, he could walk on the ground at the bottom of the sea, and enter the cabin of a sunk ship to take out the goods. The inventor is said to have himself used this machine very extensively in recovering wrecks, and with such success as to have acquired considerable property by it. We are not informed of the depths to which he descended.

Klingert's diving chest. Mr Klingert, the inventor of the water armour, also contrived a diving chest, of the form of a hollow cylinder, to be used along with it. This contained fifty-eight cubic feet of air, which, he estimated, would last two hours. It was suspended from a boat, but could be raised and depressed independently of this by a pump compressing or dilating the included air. Thus the ballast is so adapted to the size of the machine, as to make it sink so far that only a cubic foot of it remains above water. In this state an additional weight of a hundred pounds will depress it below the surface, or make it sink to the bottom. The effect of adding extra weights is produced by diminishing the volume of contained air, by condensing it into a smaller space. To accomplish this, a large cylinder is applied in the bottom of the vessel, and provided with a piston, which, by a rack and pinion, can be moved from one end of the cylinder to the other, when the diver turns a handle, coming through the side of the machine, and communicating motion by a worm and wheel to the pinion of the rack before mentioned. The lower end of the cylinder is open to the water, and the upper end opens

within the machine; therefore, when the diver turns the handle in the direction to raise up the piston in its cylinder, it necessarily diminishes the bulk of the included air, and the machine will sink; but on depressing the piston in the cylinder, it will ascend again. The inventor proposed to furnish the machine with two small oars to move it in the water, and an anchor or grapnel to make it fast whilst the diver walks about on the bottom, within the limits of the length of the pipe, to examine sunk bodies, and discover the best mode of raising them. To prevent danger from any accident happening to the machine, the diver is to be provided with the means of quickly detaching the pipes from the machine, and retaining a sufficiency of air in the armour to carry him to the surface when he throws off the weight suspended from his girdle.

Rowe's diving chest.

Another diving machine or chest was invented by Mr Rowe in 1753, and is represented in Plate CCV., fig. 4. It consists of a trunk or hollow copper vessel AB, soldered or riveted together with strength proportioned to the depth of water where it is to be fixed. It contains the diver's body, and also a sufficiency of air for the time he intends to dive. He enters with his feet first at the open end A, which is then closed by a lid or cover screwed on by a number of screw bolts passing through the flanches. The vessel is bent at F, for the bearing of the diver's knees, and has a sufficiency of leaden ballast at B to sink it in the right position. There are two hoops surrounding it, which, at the same time that they strengthen it, afford points of suspension by a bar, which is attached to them, and is pierced with several holes to admit a span upon the rope, which is so adjusted as to suspend the whole, with the diver in it, nearly in the position of the figure, when he will be in a convenient posture for working with his arms, which come through openings C in the vessel, to which sleeves E, of very strong leather, are attached by a hoop or ring, screwed to the vessel with the leather between them. The sleeves are lined with cloth, and the edges round the holes are defended by soft quilting, from hurting the diver's arms by the pressure, as well as to prevent the sleeves and his arms being thrust inwards. D is an aperture covered by a strong lens, for the diver to see through. At H and G are two other openings in the upper part of the vessel, covered by screw caps, which are removed when fresh air is to be introduced into the machine by the nose pipe of a pair of bellows being applied to force fresh air into one, and drive out the foul air at the other. The lower opening is also of use to pump out any water which may leak through at the joints, though this is as much as possible prevented by fitting leather into the joints of the cover and the caps before they are screwed tight. The mass of lead F is fastened to the lower side of the vessel in a line between the diver's arms, by means of hoops. On this the whole rests if it comes to the ground, and remains in a proper position for the diver to work, and fasten ropes to any thing which is to be drawn up, as shown in fig. 5.

If the water be very deep, the diver must wear a kind of saddle on his back, which, having a ridge touching the top part of the vessel withinside, enables him to keep his arms properly out of the apertures, otherwise he would not have strength to resist the pressure acting upon the surface of the arms and sleeves, which forces them into it with a weight proportional to the quantity of surface exposed, and to the depth of water. The diver gives his instruction to those above by a small line, which is laid through a staple at the side of the machine, and has a handle always hanging in reach of the diver's hand. The upper part of this line is held by a person in the boat or ship above, to whom any signal is given, by the diver snatching or twitching the line a certain number of times, as has before been agreed upon. This is immediately felt by the person above, who gives orders accordingly. The size of the vessel is such that he can continue at the bottom about half an hour, without any pipes or other supply, and will be enabled to do many things very readily, such as recovering moorings, chains lost in rivers or harbours, hooking ropes for weighing up lost anchors, or any other purpose where there is free access to the object sought; though in entering and searching the wrecks of ships, it would be less convenient than some others which we shall describe.

Diving machine to move under water.

Besides the above, several other projects of a similar kind have been proposed, not only with means within itself of raising and lowering the vessel, but with contrivances in the shape of screw arms for moving it when under water in any direction; but none with much success. This is said to have been tried in the reign of King James I. by a famous English projector, Cornelius Drebell, who, we are told by Mr Boyle, made a submarine vessel, which would carry twelve rowers besides the passengers; and that he had also discovered a liquid which had the singular property of restoring the air when it became impure by breathing. This last circumstance, with the number of persons inclosed in the machine, and the imperfect state of mechanics at the period alluded to, render the whole story extremely improbable, though it shows clearly that the idea had been entertained, and perhaps some attempt made. The celebrated Bishop Wilkins, in his *Mathematical Magic*, takes up the scheme of Drebell, and, with all the sanguine facilities of a projector, describes the benefits of these submarine enterprises. The submarine vessel of Mr Bushnell of Connecticut, in America, constructed in 1787, though very complex, appears to have been a curious and ingenious machine, and to have promised success if persevered in, according to the accounts published of it. It was intended to act chiefly as an engine of war, by advancing under water towards an enemy's ship, and fixing in the bottom of it a magazine of powder, which, by peculiar contrivances, was intended to take fire after the machine had got to a sufficient distance to be out of danger. But if this be the only use of such a machine, its failure need not be regretted. Let us now turn, then, to the most important of all diving machines yet contrived, namely,

The Diving-Bell.

General principles.

The principle of the diving-bell is extremely simple. Let any one insert a wine glass in a tumbler of water; on sinking it to the bottom, the inside of the glass will be observed to remain nearly full of air, so that any small object within the glass will remain perfectly dry, the included air being confined on all sides, and by its impenetrability excluding the water from its place. If this experiment be made with a pretty large bell-glass, inverted over a taper floating on the surface of the water in a still larger vessel, the taper will be observed to descend with the glass to the bottom; and though surrounded on all sides with water, it will be found to remain perfectly dry, and to continue burning for some time. Conceive then a vessel of wood or metal, in the shape of a wine-glass or truncated cone, but so large as, when inverted, to admit several persons within it, sitting, for instance, on a board along one of the sides. Let the whole then be suspended by a rope or chain over the side of a vessel, with a jib pulley and crane, to lower or raise the machine at pleasure. Then, on the machine being lowered and loaded with sufficient weight to sink it, the persons may all descend to a great depth in the sea, without being wetted in the small-

Diving-Bell. History.

est degree; and there is nothing to prevent them remaining any time in this situation, and moving about and doing operations at great depths.

The above, then, was the original construction of the diving-bell; and the great advantage of it, and what distinguishes it above every other similar invention, and renders it vastly superior, is, that being perfectly open below, the divers can get out and in with the utmost facility. This invention, according to Professor Beckmann, is generally assigned to the sixteenth century; and "I am of opinion," says he, "that it was little known before that period. We read, however, that in the time of Aristotle divers used a kind of kettle, to enable them to continue longer under the water; but the manner in which it was employed is not clearly described. The oldest information which we have of the use of the diving-bell in Europe is that of John Taisnier, who was born in Hainault in 1509, and had a place at court under Charles V., whom he attended on his voyage to Africa. He relates in what manner he saw, at Toledo, in the presence of the emperor and several thousand spectators, two Greeks let themselves down under water, in a large inverted kettle, with a burning light, and rise up again without being wet. It appears that this art was then new to the emperor and the Spaniards, and that the Greeks were caused to make the experiment in order to prove the possibility of it."

"When the English in 1588 dispersed the Spanish fleet called the Invincible Armada, part of the ships went to the bottom, near the Isle of Mull, on the western coast of Scotland; and some of these, according to the account of the Spanish prisoners, contained great riches. This information excited, from time to time, the avarice of speculators, and gave rise to several attempts to procure part of the lost treasure. In the year 1665, a person was so fortunate as to bring up some cannon, which, however, were not sufficient to defray the expenses. Of these attempts, and the kind of diving-bell used in them, the reader will find an account in a work printed at Rotterdam in 1669, and entitled *G. Sinclari Ars nova et magna gravitatis et levitatis.* In the year 1680, William Phipps, a native of America, formed a project for searching and unloading a rich Spanish ship sunk on the coast of Hispaniola; and represented his plan in such a plausible manner, that King Charles II. gave him a ship, and furnished him with every thing necessary for the undertaking. He set sail in the year 1603; but being unsuccessful, returned again in great poverty, though with a firm conviction of the possibility of his scheme. By a subscription, promoted chiefly by the Duke of Albemarle, the son of the celebrated Monk, Phipps was enabled, in 1687, to try his fortune once more, having previously engaged to divide the profit according to the twenty shares of which the subscription consisted. At first all his labour proved fruitless; but at last, when his patience was almost entirely exhausted, he was so lucky as to bring up, from the depth of six or seven fathoms, so much treasure, that he returned to England with the value of L.200,000. Of this sum he himself got about sixteen, others say twenty thousand, and the duke ninety thousand pounds. After he came back, some persons endeavoured to persuade the king to seize both the ship and the cargo, under a pretence that Phipps, when he solicited for his majesty's permission, had not given accurate information respecting the business. But the king answered, with much greatness of mind, that he knew Phipps to be an honest man, and that he and his friends should share the whole among them, had he returned with double the value. His majesty even conferred upon him the honour of knighthood, to show how much he was satisfied with his conduct. We know not the construction of Phipps's apparatus; but of the old figures of a diving-machine, that which approaches nearest to the diving-bell is in a book on fortification by Lorini; who describes a square box bound round with iron, which is furnished with windows, and has a stool affixed to it for the diver. This ingenious contrivance appears, however, to be older than that Italian; at least he does not pretend to be the inventor of it.

"In the year 1617, Francis Kessler gave a description of his water-armour, intended also for diving, but which cannot really be used for that purpose. In the year 1671, Witsen taught, in a better manner than any of his predecessors, the construction and use of the diving-bell; but he is much mistaken when he says that it was invented at Amsterdam. In 1679 appeared, for the first time, Borelli's well-known work *De Motu Animalium;* in which he not only described the diving-bell, but also proposed another, the impracticability of which was shown by James Bernoulli. When Sturm published his *Collegium curiosum* in 1678, he proposed some hints for the improvement of this machine, on which remarks were made in the *Journal des Sçavans.*" The diving-bell, as hitherto used in the above simple form, is liable to two great defects, viz.

1. The elasticity of the included air prevents it from resisting entirely the entrance of the water into the lower part of the bell. The water, by the universal law of fluids, presses the bell on all sides, in proportion to the depth of the immersion. This pressure therefore it exerts upwards on the bottom of the bell, and against the included air; but the air being extremely compressible, yields to the pressure, and is contracted into a smaller volume, allowing the water to enter and occupy the lower portion of the bell. Such is the effect of this pressure, that at the depth of thirty-three feet the air becomes compressed into half its volume, and the bell fills half full of water; and the same proportion at every other depth. But,

2. The air within the bell, by continued respiration, becomes speedily unfit to support life; and the whole apparatus therefore must be raised from time to time, to receive a fresh supply. Suppose that only two persons descend in the bell at a time, we have seen that a supply of two hundred cubic inches of air per minute is absolutely necessary for each person to keep in life and sensibility. But in order to breathe freely, at least double that quantity would be required; say for two persons half a cubic foot per minute. If then we have a bell six feet long, and four feet average diameter, this would contain about seventy cubic feet, and would last upwards of two hours. So that for at least one hour or more respiration might be carried on with all manner of freedom.

Effects of pressure.

At great depths, such as twenty, thirty, forty, and sixty feet, where the usual pressure on the body from the atmosphere above is doubled and tripled, amounting in the latter case to nearly forty pounds in every square inch, one would imagine that respiration, and indeed the whole system of the body, would be deranged under so thick and confined an atmosphere. But experience proves that no great inconvenience arises from this circumstance; and the reason is, that the air pressing into every cavity within the body, as well as externally, the pressure is exactly balanced; so that the effect of the actual increase is rendered nearly insensible. The only particular sensation felt in descending in the bell is some pain in the ears, particularly at first. This increases a little as we descend, but, after resting at the bottom, goes entirely off. It arises from the effect of the condensed air acting externally on the tympanum of the ear, before the air within the tympanic cavity has acquired the same density to counterbalance it. The tympanum on the outside communicates directly with the atmosphere, the pressure of which therefore acts instantaneously. But on the inside the tympanum bounds

Pain in the ears.

the tympanic cavity; and this has no communication with the external air, excepting by the Eustachian tube, which leads from the cavity into the mouth. Through this tube, therefore, the condensed air must pass from the mouth, to supply what is necessary within the cavity for restoring the same equilibrium within and without. But the Eustachian tube is a long and narrow passage; at its commencement in the ear it has a bony structure, but towards its termination in the mouth, behind the nostrils, it becomes soft and fleshy, so as readily to close the passage, particularly with any pressure acting externally. It admits therefore an easy passage from the ear to the mouth; but when any pressure arises in the opposite direction, it acts in some degree like a valve, shutting the passage, until the increasing pressure again forces it open. Some time then elapses before all this can be accomplished; and during this time the external air pressing with full force on the tympanum, produces the pain which is felt. When the Eustachian tube opens, it is generally all of a sudden, and with a slight explosion or pop, which is followed by instant relief from the pain. This relief may often be produced by filling the mouth, or gulping the air and pressing it into the tube.

Different accounts have been given of this effect on the ears in the diving-bell; but the above seems the most accurate, and what really takes place. The effect, indeed, may be shown experimentally by shutting the mouth and nostrils, and exhausting the air from them by the action of the lungs. The air in the tympanic cavity immediately rushing through the Eustachian tube into the mouth, the external air acts on the tympanum, and produces a slight sensation of deafness, such as is felt in the bell. But, instead of exhausting the air, attempt to compress it, and force it through the tube into the internal ear; at first no effect is produced: but after exerting a considerable pressure, a slight pop is felt, and a little pain in the ear, which is just the sudden opening of the tube.

The great inconveniences of the diving-bell already mentioned were completely removed by the labours of the celebrated and ingenious philosopher Dr Halley, who about the year 1715 introduced the grand improvement of supplying it with fresh air for any length of time without raising the bell out of the water. This he effected by letting down from the vessel from which the bell was suspended, barrels of fresh air, which, by means of pipes, discharged their contents into the bell; while the foul air escaped by a small cock in the top of the bell. In this manner the air within the bell was kept perfectly fresh, and for any length of time. Another remarkable advantage arose from this plan. The force of the air in the barrels was made to discharge the whole of the water out of the bell, which the elasticity of the included air had hitherto allowed to enter and partially to fill the cavity. This was easily done by stopping the cock at the top, and letting down the barrels below the level of the bell, by which means the air included in them received a sufficient preponderating pressure to enter the bell and drive out the water. In this manner the whole cavity of the bell became available for working; and, what was of still more importance, the diver could with ease descend and walk on the bottom of the sea, the feet being only slightly immersed. The following is the interesting account which Dr Halley gives of his arrangements:

"The bell I made use of was of wood, containing about sixty cubic feet in its concavity, and was of the form of a truncated cone, whose diameter at the top was three feet, and at the bottom five. This I coated with lead so heavy that it would sink empty; and I distributed the weight so about its bottom, that it would go down in a perpendicular direction, and no other. In the top I fixed a strong but clear glass, as a window, to let in the light from above; and likewise a cock to let out the hot air that had been breathed; and below, about a yard under the bell, I placed a stage, which hung by three ropes, each of which was charged with about one hundredweight to keep it steady. This machine I suspended from the mast of a ship by a sprit, which was sufficiently secured by stays to the mast head, and was directed by braces to carry it overboard clear of the ship's side, and to bring it again within board, as occasion required.

"To supply air to this bell when under water, I caused a couple of barrels, of about thirty-six gallons each, to be cased with lead, so as to sink empty; each of them having a bung-hole in its lowest parts to let in the water as the air in them condensed on their descent, and to let it out again when they were drawn up full from below. And to a hole in the uppermost part of these barrels I fixed a leathern trunk or hose well liquored with bees-wax and oil, and long enough to fall below the bung-hole, being kept down by a weight appended; so that the air in the upper part of the barrels could not escape, unless the lower ends of these hose were first lifted up.

"The air-barrels being thus prepared, I fitted them with tackle proper to make them rise and fall alternately, after the manner of two buckets in a well; which was done with so much ease, that two men, with less than half their strength, could perform all the labour required; and in their descent they were directed by lines fastened to the under edge of the bell, which passed through rings on both sides of the leathern hose in each barrel; so that, sliding down by these lines, they came readily to the hand of a man who stood on the stage on purpose to receive them, and to take up the ends of the hose into the bell. Through these hose, as soon as their ends came above the surface of the water in the barrels, all the air that was included in the upper parts of them was blown with great force into the bell, whilst the water entered at the bung-holes below, and filled them; and as soon as the air of one barrel had been thus received, upon a signal given, that was drawn up, and at the same time the other descended, and, by an alternate succession, furnished air so quick, and in so great plenty, that I myself have been one of five who have been together at the bottom in nine or ten fathom water, for above an hour and a half at a time, without any sort of ill consequence; and I might have continued there as long as I pleased, for any thing that appeared to the contrary. Besides, the whole cavity of the bell was kept entirely free from water, so that I sat on a bench which was diametrically placed near the bottom, wholly dressed, with all my clothes on. I only observed that it was necessary to be let down gradually at first, as about twelve feet at a time; and then to stop and drive out the air that entered, by receiving three or four barrels of fresh air before I descended further. But being arrived at the depth designed, I then let out as much of the hot air that had been breathed as each barrel would replenish with cool, by means of the cock at the top of the bell; through whose aperture, though very small, the air would rush with so much violence as to make the surface of the sea boil, and to cover it with a white foam, notwithstanding the weight of the water over us.

"Thus I found that I could do any thing that required to be done just under us; and that, by taking off the stage, I could, for a space as wide as the circuit of the bell, lay the bottom of the sea so far dry as not to be over shoes thereon. And, by the glass window, so much light was transmitted, that when the sea was clear, and especially when the sun shone, I could see perfectly well to write or read, much more to fasten or lay hold on any thing under us that was to be taken up. And, by the re-

turn of the air-barrels, I often sent up orders written with an iron pen, on small plates of lead, directing how to move us from place to place as occasion required. At other times, when the water was troubled and thick, it would be as dark as night below; but in such cases I have been able to keep a candle burning in the bell as long as I pleased, notwithstanding the great expense of air necessary to maintain flame. This I take to be an invention applicable to various uses, such as fishing for pearls, diving for coral or sponges, and the like, in far greater depths than has hitherto been thought possible. Also for the fitting and placing of the foundations of moles, bridges, &c. in rocky bottoms, and for the cleaning and scrubbing of ships' bottoms when foul, in calm weather, at sea. I shall only intimate, that by an additional contrivance, I have found it not impracticable for a diver to go out of an engine to a good distance from it, the air being conveyed to him with a continued stream, by small flexible pipes; which pipes may serve as a clue to direct him back again when he would return to the bell."

Plate CCV., fig. 5, represents the construction and operations of Dr Halley's bell as thus described.

In 1721, shortly after the above experiments were made, Dr Halley contrived additional apparatus, to enable the diver to go out from the bell to a considerable distance, and stay a sufficient time in the sea, and walk about on the bottom, with full freedom to act as occasion required. Considering that the pressure being greater on the surface of the water in the bell than on any other surface which was higher than that in the bell, the air would pass by a pipe from the bell into any cavity for air; where the surface of the water was higher, he concluded that a man, by putting on his head a bell or cap of lead, made sufficiently heavy to sink empty, and in form resembling the bell itself, might keep his head dry, and might receive a constant stream of air from the great bell, so long as the surface of the water in the cap was above the level of that in the bell, by means of a flexible pipe which he would carry coiled on his arm.

In pursuance of this idea he procured pipes to be made, which answered all that was expected from them. They were secured against the pressure of the water by a spiral brass wire, which kept them open from end to end, the diameter of the cavity being about the sixth part of an inch. These wires being coated with thin glove leather, and neatly sewed, were dipped into a mixture of hot oil and bees-wax, which, filling up the pores of the leather, made it impenetrable to water; several thicknesses of sheep's entrails were then drawn over them, which, when dry, were covered with paint, and then the whole defended with another coat of leather to keep them from fretting. Several of the pipes were as much as forty feet long, the size of a half inch rope. One end of a pipe being fixed in the bell at some height above the water, the other end was fastened to a cock which opened into the cap. The use of the cock was to stop the return of the air whenever there was occasion to stoop down or go below the surface of the air in the bell, which occurred as often as there was occasion to go out or return into the machine. The diver, therefore, when he has descended to the bottom in the great bell, puts on his cap with the pipe hanging on his arm like the coil of a rope. As soon as he leaves the bell, he opens the cock in the pipe, and walks on the bottom of the sea, giving out the coils of his pipe as it is required; and this serves as a clue to direct him back again to the great bell, from whence he derives his supply of air by means of the pipe.

The weight of a man being very little more than that of his bulk in water, he could not act with any strength, nor stand with any firmness, especially if there is any current, without a considerable addition of weight; the leaden caps were therefore made to weigh about half a hundredweight, to which was added a girdle for the waist, formed of large weights of lead nearly of as great weight in the whole; also two clogs of lead for the feet, of about twelve pounds each. With this accession of weight Dr Halley found a man could stand well in an ordinary stream, and even go against it. It is necessary for the diver to be provided against the cold of the water, which, though it could not be removed so that a man could endure it long, yet it was much eased by wearing a waistcoat and drawers made close to the body, of that thick woollen stuff of which blankets are made. This becoming full of water, would be a little warmed by the heat of the body, and keep off the chill of new cold water coming on.

When the water is not turbid, things are seen sufficiently distinct at the bottom of the sea; but a small degree of thickness makes perfect night in a moderate depth of water. To obtain an open view from the leaden caps, which, from their use, the doctor called caps of maintenance, he at first used a plain glass before the sight, but soon found that the vapour of the breath made such a dew on the surface of the glass that it lost its transparency. To remedy this, he found it necessary to prolong that side of the cap which was before the eyes, and thereby enlarge the prospect of what was beneath.

Another plan of the diving-bell was proposed by Mr Martin Triewald, F. R. S. and military architect to the king of Sweden, which, for a single person, is in some respects thought to be more eligible than Dr Halley's, and is constructed as follows. AB, fig. 6, is the bell, which is sunk by lead weights DD hung to its bottom. This bell is of copper, and tinned all over in the inside, which is illuminated by three strong convex lenses P, with copper lids to defend them. The iron ring or plate below the bell serves the diver to stand on when he is at work, and is suspended at such a distance from the bottom of the bell by the chains, that when the diver stands upright, his head is just above the water in the bell, where the air is much better than higher up, because it is colder, and consequently more fit for respiration. But as the diver must always be within the bell, and his head of course in the upper part, the inventor has contrived, that even there, when he has breathed the hot air as well as he can, he may, by means of a spiral copper tube *bc*, placed close to the inside of the bell, draw the cooler and fresher air from the lowermost parts; for which purpose a flexible leather tube, about two feet long, is fixed to the upper end of the copper tube; and to the other end of this tube is fixed an ivory mouth-piece, by which the diver draws in the air, at the same time expiring by the nostrils. This bell may be supplied with fresh air by barrels, the same as Dr Halley's.

The next improvements introduced in the construction of the diving-bell were those by Mr Spalding of Edinburgh, and for which the Society of Arts voted him a reward. These are certainly deserving of attention, although they do not appear to have afterwards been adopted in practice. Mr Spalding had, in the two preceding years, acquired considerable experience in the management of a bell on Dr Halley's plan, which he had constructed in the hopes of recovering part of a considerable property which had been lost in a ship wrecked on the Scares, or Fern Islands, in 1774, in the night, when all the crew perished. Some of the light goods were thrown on shore, and it was proposed to recover the rest by diving, the remainder of the owners giving up the management of the whole to Mr Spalding. His first experiments were made in depths of five, six, and eight fathoms, in Leith Roads; and having in these made his apparatus

Spalding's trials in Dr Halley's bell.

tolerably perfect, he sailed for Dunbar, thirty miles distance, in an open long boat, sloop-rigged, and of about six or eight tons burthen. By a mistaken account he had been informed the bottom of the Fox ship of war lay there; but upon his arrival, the oldest seaman in the place could give him no intelligence; and as that vessel had perished in the night with all on board, somewhere in Dunbar Bay, and by storms, so long before as thirty years, it was thought to be sanded up. In order to gratify the curiosity of some friends there, he still determined to descend where it might be thought probable her bottom lay; but in seven and eight fathoms water he found nothing but a hard sandy bottom, from which he was led to conjecture that the proprietors of the valuable effects which were on board that vessel might have found their account in sweeping for her. Being informed that a vessel, which was thrown up by accident in the river Tay, near Dundee, with a large quantity of iron, lay within two fathoms of the surface at low water, he determined to make trial there, and accordingly sailed across the frith to that place, about forty-five miles distant from Dunbar. Here he went down three different times, changing the ground at each going down, and at last fell in with a stump of the wreck, sunk five fathoms deep at low water to a level with the soft bed of the river, which is composed of a light sand intermixed with shells. The principal parts of this wreck were supposed to have been carried away by an immense body of ice the year before. He found that the muddiness of the river occasions a darkness at only two fathoms from the surface that cannot be described; and from the smallness of his machine, which contained only forty-eight English gallons, it was impossible to have a candle burning in it, which would consume the air too quickly for any man to be able to work, and at the same time pay attention to receiving the necessary supplies of air.

These trials were only preparatory to his views at the Scares, hoping to acquire experience which would enable him to surmount the dangerous difficulty of the unequal rocky bottom which he expected to meet with; but in the preceding trials, and different alterations of the machinery, so much time had been lost, that the weather became stormy, and he was obliged to wait at Bamborough Castle some time till the weather became more favourable. He then sailed to the Scares with his brother, three sailors, and two pilots. It was four in the afternoon, about high water, when he went down at a small distance from the place where he judged the wreck to lie. The depth was about ten fathoms. He fortunately alighted on a flat part of the rock, within a small space of a dreadful chasm, and had just gone two steps with his machine, when the terror of the two pilots was so great, that, in spite of his brother, they brought him up very precipitately, before he had in any degree examined around him. On coming into the boat, they remonstrated on the danger of the machine being overturned either on the wreck or the rocks, and also on the impossibility of raising any of the weighty goods with so small a purchase in an open boat, and in a place where, at this season, no large vessel would venture to lie, as the nights were then so long, and only two passages for a small vessel to run through, in case of a gale of easterly or southerly wind; one of the passages being extremely narrow, and both of them dangerous.

"Convinced from this," says Mr Spalding in his account, "that with an open boat nothing could be accomplished, and that, except in June and July, no man would risk himself with me in a sloop, to continue a few days and nights at anchor there, I was obliged to abandon my project; yet I determined to take a view of the guns of a Dutch ship of war lost in the year 1704; and as they lay two or three miles nearer the land, I could execute this design with less difficulty, especially as the weather continued still favourable. Having procured all the intelligence possible, we went to the place, where I went down four different times, but could find no marks of any wreck, notwithstanding my walking about in five and six fathoms water, as far as it was thought safe to allow the rope to the bell, continuing generally twenty minutes each time at the bottom. On this occasion I was obliged to carry a cutting hook and knife, and clear away the sea weeds, which at this place are very thick and strong; without this method I could not move about. At the fifth going down, each trial being in a different place, I was agreeably surprised to find a large grove of tall weeds, all of them from six to eight feet high, with larg tufted tops, mostly in regular ranges, as far as the eye could reach, a variety of small lobsters and other shell-fish swimming about in the intervals." He then discovered the place where one of the cannons lay; but was too much exhausted, by having been down at intervals for near three hours, to attempt bringing it up.

In these descents Mr Spalding found out two very serious dangers attendant on the use of the bell on Dr Halley's plan. These are, 1. By Dr Halley's construction, the sinking or rising of the bell depends entirely upon the people who are at the surface of the water; and as the bell, even when in the water, has a very considerable weight, the raising of it not only requires a great deal of labour, but there is a possibility of the rope breaking by which it is raised, and thus every person in the bell would inevitably perish. 2. As there are, in many places of the sea, rocks which lie at a considerable depth, the figure of which cannot possibly be perceived from above, there is danger that some of their ragged prominences may catch hold of one of the edges of the bell in its descent, and thus overset it before any signal can be given to those above, which would infallibly be attended with the destruction of the people in the bell, especially as it must always be unknown, before trial, what kind of a bottom the sea has in any place.

Spalding's improvements.

To obviate these defects, Mr Spalding introduced a balance-weight suspended below the bell, and which, when it reached any rocky or uneven ground, settled down first, and then the bell being made too light to sink without the weight, remained suspended and free from danger; and for the purpose of raising or levelling the bell without aid from above, he divided with an air-tight partition the upper portion of the bell from the lower. The former was capable of being filled either with water or air at pleasure, and of thus increasing or diminishing the buoyant effect at pleasure, on the same principle as the air-bladder in fishes.

Plate CCV., fig. 7, represents these arrangements, which will be understood from the following description: ABCD represents a section of the bell, which is made of wood; *ee* are iron hooks, by means of which it is suspended by ropes QBF*e*, and QAER*e*, and QS, as expressed in the figure; *cc* are iron hooks, to which are appended lead weights, that keep the mouth of the bell always parallel to the surface of the water, whether the machine, taken altogether, is lighter or heavier than an equal bulk of water. By these weights alone, however, the bell would not sink; another is therefore added, represented at W, and which can be raised or lowered at pleasure by means of a rope passing over the pulley, and fastened to one of the sides of the bell at M. As the bell descends, this weight, called by Mr Spalding the *balance-weight*, hangs down a considerable way below the mouth of the bell. In case the edge of the bell is caught by any obstacle, the balance-weight is immediately lowered down, so that it

may rest upon the bottom. By this means the bell is lightened, so that all danger of oversetting is removed; for, being lighter without the balance-weight than an equal bulk of water, it is evident that the bell will rise as well as the length of the rope affixed to the balance-weight will allow it. This weight, therefore, will serve as a kind of anchor, to keep the bell at any particular depth which the divers may think necessary; or, by pulling it quite up, the descent may be continued to the very bottom.

By another very ingenious contrivance, Mr Spalding rendered it possible for the divers to raise the bell, with all the weights appended to it, even to the surface, or to stop at any particular depth, as they might think proper; and thus they could still be safe, even though the rope designed for pulling up the bell was broken. For this purpose the bell is divided into two cavities, both of which are made as tight as possible. Just above the second bottom EF, are small slits in the sides of the bell, through which the water entering as the bell descends, displaces the air originally contained in this cavity, which flies out at the upper orifice of the cock GH. When this is done, the divers turn the handle G, which stops the cock; so that if any more air was to get into the cavity AEFD, it could no longer be discharged through the orifice H, as before. When this cavity is full of water, the bell sinks; but when a considerable quantity of air is admitted, it rises. If, therefore, the divers have a mind to raise themselves, they turn the small cock *g*, by which a communication is made between the upper and under cavities of the bell. The consequence of this is, that a quantity of air immediately enters the upper cavity, forces out a quantity of the water contained in it, and thus renders the bell lighter by the whole weight of the water which is displaced. Thus, if a certain quantity of air is admitted into the upper cavity, the bell will descend very slowly; if a greater quantity, it will neither ascend nor descend, but remain stationary; and if a larger quantity of air is still admitted, it will rise to the top. It is to be observed, however, that the air which is thus let out into the upper cavity must be immediately replaced from the air-barrel; and the air is to be let out very slowly, or the bell will rise to the top with so great velocity that the divers will be in danger of being shaken out of their seats. But, by following these directions, every possible accident may be prevented, and people may descend to great depths without the least apprehension of danger. The bell also becomes so easily manageable in the water, that it may be conducted from one place to another by a small boat with the greatest ease, and with perfect safety to those who are in it.

Instead of wooden seats used by Dr Halley, Mr Spalding made use of ropes suspended by hooks *bbb*, and on these ropes the divers may sit without any inconvenience. I and K are two windows made of thick strong glass, for admitting light to the divers. N represents an air-cask with its tackle, and NP the flexible pipe through which the air is admitted to the bell. In the ascent and descent of this cask the pipe is kept down by a small weight appended, as in Dr Halley's machine. F is a small cock by which the hot air is discharged as often as it becomes troublesome. Fig. 5 is a representation of the whole diving apparatus, which it is hoped will be readily understood without any further explanation. Two air-barrels are represented in this figure; but Mr Spalding was of opinion that one air barrel capable of containing thirty gallons is sufficient for an ordinary machine.

An improvement has been suggested on Mr Spalding's plan of raising or lowering the bell, by shutting up the upper bell entirely, and forming it into a magazine of condensed air, which being charged by two air-pumps within the bell, could be let off at pleasure, and filling the lower bell, would displace the water and increase the buoyancy.

Last great improvement in introduction of an air-pump by Smeaton.

The last great improvement on the diving-bell, and what stands next in importance to that of Halley, and has brought the machine to that perfect state in which it is now so successfully employed, was introduced by the celebrated engineer Mr Smeaton. This consisted in substituting for the air-barrels of Halley a forcing air-pump, by which a continued stream of air was poured into the bell without any farther trouble or apparatus than a man or two to work the pump. It was about the year 1779, in the repairs of the foundations of Hexham Bridge, that Mr Smeaton first tried the use of the diving-bell; and this was the first attempt indeed to introduce it into the operations of engineering, where it has since rendered such essential service. The piers of the bridge having been undermined by the violence of the current sweeping away the gravel from under the floor timbers of the caissons by which they were founded, it occurred to Smeaton that by means of the diving-bell the cavities under the foundations might be filled up with rough stones, rammed and wedged firmly together. His diving-bell consisted of a square box or chest of wood, three and a half feet long, two feet broad, and four feet high. The pump for supplying it with air was fixed on the top of the bell, and worked by a handle at one side. The depth of the river being small, it was not intended to go down so as to cover the whole of the bell, else the air-pump would have required to be removed; it was only necessary to sink the mouth of the bell down to the level of the caisson bottom. With the assistance of this machine Mr Smeaton succeeded in underpinning the foundations of some of the piers. The calamitous accident which followed in 1782, when the whole structure was carried away by a sudden and violent flood, only proved the great insufficiency of the natural bed of the river.

Trial at Hexham Bridge.

Operations at Ramsgate harbour.

In 1788 Mr Smeaton constructed a second diving-bell, for the operations contemplated at Ramsgate harbour, on a much more substantial and improved plan; and this is the model on which all the succeeding diving machines have been formed. Instead of the usual form of a bell or conical inverted tub of wood, sunk by weights attached to the outside, this consisted of a square chest of cast iron, four and a half feet long, four and a half feet high, and three feet wide, affording sufficient room for two men at a time to work under it. Instead of the weights applied externally, the bell itself was cast of such thickness, particularly at the bottom, that its own weight, viz. fifty cwt., was more than sufficient to sink it when full of air. The pump also for supplying fresh air was placed in a boat by itself, on which several hands were stationed, to keep the pump continually in action. The air from the pump was conveyed to the machine by a flexible tube, which allowed the bell to be moved up or down, or in any direction, independent of the motion of the boat. From the above dimensions, the bell would always contain about fifty cubic feet of air, which, from what we have already shown, would be sufficient to support life for two persons for about an hour, independent of any supply from above; so that any idea of danger from this source is completely removed. It was in clearing the foundations for the advanced pier at Ramsgate that it occurred to Mr Smeaton the operation might be facilitated by the diving-bell. A large quantity of stones had been thrown in, to secure the old pier head; and it seemed doubtful whether they could be got up in nine and ten feet water by the usual method of tongs from the barges. The diving-bell was found to answer completely the object intended. In the course of two months the foundations were cleared; and it was computed that of 160 tons of stone raised out of the foun-

dation, about 100 stones, many of them above a ton each, were brought up by the diving-bell, without which a full season would have been lost.

The pier, which was afterwards built on the foundation thus cleared, was founded by caissons, but in the course of years was found to require renewal in some places, and in others to be protected by an apron or outside wall of regularly-built masonry; and here a new application of the diving-bell arose in the building of this wall under water. For this purpose the bell is suspended by powerful tackle to the extremity of a long wooden frame, which rests on the top of the pier, the one end projecting over the pier, and the other running back and turning on a centre pin, which is fixed in a heavy stone on the pier. The frame thus sweeping with a long radius, and the weight of the whole being borne by a roller running along near the edge of the pier on a cast-iron plate or rail in the segment of a circle, the bell is capable of having a considerable motion right or left along the wall, and the block of the tackle being moveable along the frame, the bell is by this means shifted out or in from the wall at pleasure; and by these two motions can be set in any required position within the sweep of the apparatus. The directions for moving it are given by the divers, and communicated to those who have charge of the apparatus above, by merely striking with a hammer on the inside of the bell. From the great facility with which water conducts sound, the strokes of the hammer are heard at a great distance, and have a peculiar character, which is not easily mistaken for any other. To convey various directions, the divers have established a sort of language from the number of blows of the hammer. One blow, for instance, denotes more air; two, stand fast; three, heave up; four, lower down; and so on. The first operation in the building is to clear and level the foundation. If this be loose materials, they are removed by dredging, in the usual manner; but wherever rock occurs, it is done by the bell, with two men in it, being let down to the bottom, which, at Ramsgate, is a hard chalk rock. When it stands thereon, it lays the chalk dry to the level of the bottom edge of the bell; but if the surface is uneven, the bell cannot descend so low but that it will leave six or eight inches of water on the bottom. The surface of this water is the level they work to, and by cutting away every eminence which rises above the water, they soon obtain a perfectly level surface. They work with a small pick, made something like a narrow adze, for this purpose; and the work proceeds rapidly, for the chalk is not very hard. When they have accumulated as much rubbish as becomes inconvenient, they give three knocks on the bell to order the people to draw it up, till they, standing on the bottom, find themselves knee deep; then two knocks to stand fast. They now take in a shallow basket which has been previously let down from above, and fill the rubbish into it, then snatch it to order it to be drawn up, and strike four times on the bell, that they may be lowered down to proceed with their work. Having in this manner hewed away the surface till the water, standing equally all over it, shows it to be a perfect level plane, they give orders to be removed to a new situation, yet at such a small distance that part of the surface they before levelled is still beneath the bell, in order that both may be brought to one plane. Thus continuing the work, they get all the rock prepared for the stone-work, without any other level than the water.

The foundation being thus levelled, the stones are in the mean time all prepared and jointed, either square or with dovetails. These are first hoisted from the pier by means of a crane, and let down to their places in the work, as nearly as can be done, by the crane. As each stone is thus laid, the divers direct themselves right or left, up or down, until they be exactly over the stone; then making fast a strong chain to the lewis of the stone, the other end of which is attached to a ring in the top of the bell, they give the signal to heave, and the bell, with the stone under it, are both suspended by the tackle, and being moved right or left until it cover exactly over its place in the wall, it is then let down, and the chain being detached, the operation proceeds with another stone in the same manner, until the wall be completed. No cement is generally used to unite the stones; their own weight, and the accuracy of the joints, being sufficient to hold them together

Diving-bell employed in other places.

Since the completion of Ramsgate harbour, the diving-bell has been applied with great success to various other operations of a similar kind in different parts of the kingdom, and particularly at Dublin, Donaghadee, and other harbours in Ireland, and at Holyhead and Portpatrick on this side the channel. Plate CCIV. contains drawings of the bell and machinery used for the harbour of Howth, near Dublin, under the direction of the late eminent Mr Rennie, and with which the foundations of the pier wall were laid with success at very considerable depths below water.

Account of bell and machinery at Houth near Dublin.

Fig. 1 is a section showing the machine and the bell viewed in the direction of the length of the wall which is to be erected, and fig. 2 is an elevation of the same as it appears when viewed from the sea. A is the bell, which is made of cast iron. It is suspended by strong chains passed through eyes *rr*, fig. 5, and through the ring *m* of a tackle B. FF, figs. 1 and 2, are strong beams supported in a horizontal position by cross beams G, resting at one end on the shore, and the other ends supported by a scaffolding L of piles firmly braced. On the beams F two iron railways are laid for the wheels of two carriages to run upon; one of these carriages contains the tackle which suspends the bell, and the other has a similar tackle to hoist the large stones, which are to be laid on the wall X. Each carriage runs with four wheels *aa* upon the railways F, and has a smaller or upper carriage running upon it in a transverse direction; and this upper carriage contains the windlass purchase tackle, by which the bell or the stone is raised. Thus F′ is the timber frame of the principal carriage, on the top of which are railways for the wheels *dd* of the upper carriage, of which D is the frame; and C is the roller or barrel to wind up the rope or fall of the great purchase tackle B, which is suspended from the frame of the carriage, and bears the weight of the bell. On the end of the barrel is a large cog-wheel M, which is turned round by a pinion fixed on the axis N of a second wheel O, and this is turned by a pinion, to which the handles H are applied. By turning these, two men can raise or lower the bell with ease. In order to move the bell in either direction, the wheels *aa* of the lower carriage E are provided with cogs at one edge, and pinions *b* work in the teeth of these; both pinions *b* are fixed on the same axis, which extends across the frame; and wheels *c* are also fixed on each extremity of the axis. These wheels have holes or mortises in them to receive handspikes or levers, by which they can be turned round, and will then move the lower carriage and the bell along the railways FF, in the direction of the length of the wall, which is to be built as shown by X. In like manner the wheels *dd* of the upper carriage are provided with cogs and pinions *e*, on the end of which are the capstan head *f* to receive handspikes, when it is required to move the upper carriage and the bell in a transverse direction. By means of these two motions in transverse directions, the bell or the stone can be suspended over any required spot in the wall, and lowered down thereupon as the men in the bell direct. Fig. 5 is a section of the bell, and fig. 6 a

plan to show the apertures *nn* for the lenses which give light. Two men descend together, a seat *s* being fixed across on each side of the bell. The air-pipe is screwed on at *k*, and proceeds to the air-pump as shown in fig. 1 The pump is placed on the top of the scaffold G; it has two barrels I I, which are worked by a lever K, by one or two men; they act as forcing pumps, and the air which is thrown down escapes from the lower edge of the bell, and rises up through the water in bubbles. By this means the air in the bell is at all times quite fresh and pure.

The stones which are to be used in building the wall are prepared on shore, and fitted to each other. When all is prepared, these stones are lowered down the bank by a capstan to the position *w*. The rope of the machine is then attached, and by the aid of both ropes the stone is lowered down upon the wall. The divers then descend in the bell, and the two carriages are brought close together, by which means the bell will hang partly over the stone W, fig. 2, so that the men can guide it into its place on the wall X, and make signals to those above to direct them which way to move the stone, and where to lower it. The bell was also employed, in the first instance, to clear the foundation for the walls. It was then lowered quite down on the bottom, and the men worked the rock to a level surface. In many parts it was requisite to blast it with gunpowder. The divers bored the hole in the rock, and placed the powder in a tin cartridge, which was well secured in the hole, by running in small fragments of stone. A small tin pipe was affixed to the canister, long enough to reach up above the surface of the water. When all was prepared, the bell was drawn up out of the way, and a nail or other small piece of iron heated red hot was dropped into the tin pipe, thereby to descend to the powder.

Figures 3 and 4 represent a vessel which was fitted up under the direction of Mr Rennie, to carry a diving-bell of cast iron. This vessel was used in Plymouth Sound, and the bell was swept over the bottom to discover and take up old anchors, &c. The bell A is suspended over the bow of the vessel, by a strong tackle *q*, from the extremity of a pair of shears; that is, two masts DB, DB, fig. 4. The fall or rope of the tackle *q* is drawn up by a windlass at C. There is also another strong tackle GH, extended between the head of the mast I and the top of the shears D. This is drawn by the windlass F. The use of this is to raise the shears upright, and bring the bell on board. A platform S is fixed on the deck to lower it upon when out of use.

Diving-bells on the Clyde.

The diving bell has lately been employed with success in improving the navigation of the Clyde between Glasgow and Greenock, by raising up and removing out of the bed of the river a number of large stones which obstructed the channel, and could not be so readily got out by any other means. The bell is constructed similarly to that in fig. 3, but instead of being let down at the end or side of the barge, has a well constructed in the middle of the vessel itself, in which it is made to rise and fall by strong chains, tackling, and cranes. Recently a second barge and bell have been constructed, and are now employed on the river for the same purpose. The management of the vessel and bell requires six or seven hands. The whole can be moved with great facility to different parts of the river, and moored wherever their assistance is required.

Such, then, is an account of the construction and uses of the different diving machines, and particularly the diving-bell; and we have no doubt that the principle, as it is susceptible of it, may yet be still more extensively applied, and in various other ways. The only disadvantage attending the machine in its present form is the expense and cumbrous nature of the apparatus, which prevents its use in many cases where it might be of real service; so that it is only in some great and extensive public work that it can ever be thought of. It is to be hoped, therefore, that the skill and ingenuity of our mechanicians may yet succeed in introducing the machine in a more accessible and manageable form.

DIVINITY, Deity, godhead; the Deity; the nature or essence of God. It likewise denotes any celestial being; and among the pagans was applied to their false gods. Divinity also signifies the science of divine things, and hence is used as synonymous with theology.

DIVISIBILITY, that general property of bodies by which their component parts or particles are capable of separation.

All bodies that possess sensible extension are divisible; for since no two particles of matter can exist in the same place, it follows that they are really distinct from each other; which, indeed, is all that is meant by being divisible. In this sense the least conceivable particle must still be divisible, since it consists of parts which are really distinct. To illustrate this by a familiar instance, let the least imaginable piece of matter be conceived lying on a smooth plane surface; it is evident the surface will not touch it everywhere, and those parts, therefore, which it does not touch may be supposed separable from the others.

All that is supposed in strict geometry, says Mr Maclaurin, concerning the divisibility of magnitude, amounts to no more than that a given magnitude may be conceived to be divided into a number of parts equal to any given or proposed number. It is true that the number of parts into which a given magnitude may be conceived to be divided is not to be fixed or limited, because no given number is so great but a greater may be conceived and assigned; but there is not, therefore, any necessity for supposing the number of parts actually infinite; and if some have drawn very abstruse consequences from such a supposition, yet geometry ought not to be loaded with these.

How far matter is actually capable of being divided, may in some measure be conceived from this, that a piece of wire gilt with so small a quantity as eight grains of gold, may be drawn out to a length of 13,000 feet, the whole surface of it still remaining covered with gold. We have also a surprising instance of the minuteness of some parts of matter in the nature of light and vision. Let a candle be lit and placed in an open plain, it will then be visible for about two miles round; and consequently, were it placed two miles above the surface of the earth, it would fill with luminous particles a sphere four miles in diameter, and this before it had lost any sensible part of its weight. A single grain of blue vitriol will communicate an azure tinge to five

gallons of water; consequently it will be divided into as many parts as there are visible portions of matter in that quantity of water. There are perfumes which, without a sensible diminution of their quantity, will fill a very large space with their odoriferous particles: these must therefore be of an inconceivable smallness, since there is a sufficient number in every part of that space sensibly to affect the organ of smelling. Dr Keill demonstrates, that any particle of matter, how small soever, and any finite space, how large soever, being given, it is possible for that small particle of matter to be diffused through all that space, and to fill it in such a manner as that there shall be no pore in it whose diameter shall exceed any given line.

The chief objections against the divisibility of matter *ad infinitum* are, that an infinite cannot be contained by a finite; and that it follows from a divisibility *ad infinitum*, either that all bodies are equal, or that one infinite is greater than another. But the answer to these objections is easy; for the properties of a determinate quantity are not to be attributed to an infinite considered in a general sense; and who has ever proved that there could not be an infinite number of infinitely small parts in a finite quantity, or that all infinites are equal? The contrary is demonstrated by mathematicians in innumerable instances.

DIVISION, in general, is the separating a thing into two or more parts.

Mechanical DIVISION signifies that separation which is occasioned in the parts of a body by the aid of mechanical instruments, such as a mortar and pestle, a mill, &c.

DIVISION, in military language, signifies generally a certain portion of an army, consisting of infantry and cavalry, either together or separately. The divisions of an army are the several brigades and squadrons of which it is composed. The divisions of a battalion are the several platoons into which a regiment or battalion is divided. The term is also applied to any number of men on military duty detached from an established body; as a division of artillery, a division of pioneers, &c.

DIVISION, in the Royal Navy, a select number of ships in a fleet or squadron, under a commander, and distinguished by a particular flag or pendant. A squadron is commonly ranged into three divisions, that of the commanding officer being in the centre.

DIVISION, in *Algebra*, and in *Arithmetic*. See ALGEBRA, and ARITHMETIC.

DIVORCE (Lat. *divortium*), a breach or dissolution of the bond of marriage.

Both among the pagans and the Jews a great latitude was allowed of in divorce. At Athens and at Sparta, the only Greek states of whose laws on this subject we have any certain information, a divorce might be effected either by the husband or the wife; though in the woman's case it was a matter of some difficulty. The husband, on the other hand, was permitted by the Athenian law to divorce his wife by a very summary process—namely, by turning her out of his house. This was usually done in the presence of witnesses; but the husband was bound to restore her portion, or in lieu of it to pay her the interest on it at the rate of nine oboli per drachma every month, besides an allowance for alimony. A woman could only sue for a divorce by appearing in person before the archon, and delivering up a memorial stating the grounds upon which she sued for a divorce. The terms expressing the separation of men and women were different; the man being said ἀποπέμπειν, *to dismiss his wife*, and the woman ἀπολείπειν, *to leave her husband*. At Sparta, according to Herodotus, a man might divorce his wife on the plea of barrenness. The Cretans, again, are said to have permitted a man to divorce his wife if he was afraid of having too great a number of children.

Among the Romans, the ordinary causes of divorce were sterility, old age, bodily disease, insanity, and banishment; to which were afterwards added by Justinian a vow of chastity and the profession of the monastic life—with a view to conciliate his Christian subjects. Divorce always existed in the Roman polity, and appears to have been permitted on very slight grounds, since either party might declare his or her intention to dissolve the marriage on the plea of the absence of conjugal affection—abiding consent being considered essential to the continuance of the connection. The dissolution of the marriage might be effected without any judicial process. According to Plutarch (Romulus, c. 22), the husband alone originally was able to effect a divorce; but his authority on this point is questionable. The earliest instance of a divorce at Rome is said to have occurred under the consulship of M. Attilius and P. Valerius, about the year B.C. 234, when Sp. Carvilius Ruga put away his wife on the plea of barrenness; but it would appear that his behaviour was much censured.

Divorces were of comparatively rare occurrence at Rome till towards the latter end of the republic; and under the emperors they became very common. Doubtless the state of the law tended greatly to multiply divorces, since either party was at liberty to contract a new marriage. Pompey divorced his wife Mucia on the charge of adultery; Cicero divorced his aged wife Terentia and married a young woman; Cato the younger lent his wife Marcia to his friend Hortensius, or in other words he divorced her that his friend might marry her and have children by her; and Julius Cæsar divorced Pompeia because she was suspected of intriguing with Clodius. As a general rule, the portion (*dos*) of the wife was returned to her when divorced by the husband, or when they separated by mutual consent. Their offspring in all cases remained at the disposal of the father. A constitution of Diocletian and Maximian, however, empowered a competent judge to declare whether the father or the mother should be entrusted with the care of the children. In certain cases, a sixth part of the wife's portion might be retained by the husband; as, for example, when the wife had been convicted of infidelity.

It was necessary, in proceeding to effect a divorce, to make a distinct notice or declaration of the intention to separate. The term *repudium* is said to differ from *divortium*, in that the former properly applies to a marriage only contracted; but these terms appear to be sometimes used indifferently. In the time of Augustus an attempt was made to restrain the facilities for divorce, by the *Lex Julia de Adulteriis* and the *Lex Pappia—Poppæa*.

"The law of Moses," observes Archdeacon Paley, "for reasons of local expediency, permitted the Jewish husband to put away his wife; but whether for every cause, or for what cause, appears to have been controverted amongst the interpreters of those times. Christ, the precepts of whose religion were calculated for more general use and observation, revokes this permission, as given to the Jews 'for their hardness of heart,' and promulgates a law which was thenceforward to confine divorces to the single cause of adultery in the wife: 'Whosoever shall put away his wife, except it be for fornication, and shall marry another, committeth adultery; and whoso marrieth her which is put away, doth commit adultery.'"

By the law of Scotland, a divorce may be obtained on the ground either of adultery or of wilful desertion. Neither of these grounds, however, dissolves the marriage *ipso jure*; and if a process of divorce be not instituted, the marriage subsists, notwithstanding the adultery or desertion. Until recently the action of divorce proceeded before the commissaries of Edinburgh; and in every such action, whether founded on adultery or desertion, the pursuer must make oath that the action is not collusive. The legal effect of divorce on the ground of desertion is, that the offending party loses the "tocher," as it is called, and the *donationes*

Divorce.

propter nuptias; that is, the offending husband is bound to restore the dowry, and to pay or make good to the wife all her provisions, legal or conventional; and the offending wife forfeits her dowry, and all that would have come to her had the marriage been dissolved by the predecease of her husband. It is now held that recrimination is not a good defence against divorce for adultery; yet, as the mutual guilt may affect the patrimonial interests of the parties, it may be stated in a counter action. But *lenocinium*, or the husband's participation in the profits of his wife's prostitution, nay, even the husband's connivance in her guilt, is a good defence to the wife against an action of divorce on the ground of adultery. The statute 1600, cap. 20, declares marriages contracted between the adulterer and the person with whom he or she may be found by the sentence of divorce to have committed the crime, to be null and unlawful, and the issue of such marriages to be incapable of succeeding to their parents; but the act, nevertheless, has not the effect of bastardizing such issue. The right to institute a divorce is personal to the husband or wife; but if, after the action has been raised, either party die before the decree of divorce becomes final, it has been argued that the natural dissolution of the marriage by death supersedes and definitively closes all proceeding commenced for dissolving it on any other ground. The natural dissolution, it has been contended, is the first effectual one, and that which is to regulate all questions as to the *status* of the survivor. How far litiscontestation in such a case renders it transmissible to representatives, has not yet, we believe, been decided.

Divorce in England.

The following is the substance of the inquiries and recommendations of the commissioners appointed by Her Majesty in December 1850 to inquire into the law of divorce. Divorces in England are of two kinds—the one partial, and the other total. Partial divorces are called divorces *à mensâ et thoro*, because they separate the married parties from each other's society without dissolving the marriage union. Total divorces are called divorces *à vinculo matrimonii*, because they dissolve that union altogether, either on the ground of some antecedent incapacity which rendered the contract void from the beginning, or on the ground of some supervenient cause, which having arisen subsequently to the marriage justifies the parties in desiring to put an end to it.

Divorces *à mensâ et thoro* are little more in the eye of the law than simple separations; they only last until the parties think fit to be reconciled; and they are granted at the suit of the husband or wife, when the gross misconduct of either of them—such as cruelty, adultery, or the like—have rendered it impracticable for them to live together; but so careful is our law to encourage reconciliations, that an express clause to that effect ought always to be inserted in the sentence of divorce.

The common law of England, which follows in this case the canon law of the church, "deems so highly, and with such mysterious reverence, of the nuptial tie," that the causes of divorce are purposely limited to a few extreme and specific provocations; and the preservation of that union, so long as it can be secured, is so manifestly essential to the best interests of society, that before it can be dissolved it must be clearly established by the strictest proof that the offence has been committed; that there is no contrivance by which the parties are endeavouring to escape from their solemn obligations to themselves and their children; that they cannot discharge their mutual duties by continuing any longer to cohabit with each other; and that the party complaining is free from guilt.

A divorce *à mensâ et thoro* will neither bar the wife of her dower, nor deprive the husband of his marital rights in respect of her property. Nor will it enable either of the parties to marry again; nor will it exempt them from the censure of the ecclesiastical court for living incontinently. Nor will it bastardize the subsequent born issue; but during the separation the court will decree a competent allowance to the wife for her maintenance under the name of alimony. This allowance depends on the innocence or delinquency of the parties, and is measured by the means and circumstances of the husband.

Before the Reformation, marriages were liable to be set aside on the ground of some antecedent incapacity which rendered it in reality void from the beginning; upon proof of precontract with some other person; or because the connexion was within the degrees of consanguinity or affinity prohibited by the canon law, which was far more restrictive than the law of God.[1] But since the Reformation these rules have been altered on account of the inconveniences which resulted from them; for, to use the language of an old statute, "Marriages were brought into such uncertainty thereby, that none could be surely knit and bounden, but it should be in either of the parties' power and arbiter (casting away the fear of God by means and compasses) to prove a precontract, a kindred and alliance, or a carnal knowledge, to defeat the same." The only grounds, therefore, since the passing of that statute, for nullifying and absolving the marriage contract by reason of some antecedent incapacity, are relationship within the forbidden degrees, a previous marriage, corporal imbecility, or mental incompetency.

In cases of this description the ecclesiastical courts do not exercise, nor do they possess, a rescinding power.

The effects of a sentence nullifying a marriage are, first, that the wife is barred of her dower; secondly, that the issue are illegitimate; and thirdly, that the parties so divorced may marry again.

By the law of England the marriage contract is indissoluble; and when once it has been constituted in a legal manner, there are no means of putting an end to it in any of our courts. Nevertheless, the actual dissolution of such a contract, when adultery has been committed, is so con-

[1] Every one knows how much it was the policy of the Roman Church to multiply impediments to matrimony; the power of granting dispensations having been in all ages a fruitful source of ecclesiastical revenue. Not only were marriages with cousins interdicted, but the relation of affinity was held to be contracted by mere commerce between the sexes. Thus, if a man had connection with one sister, though not married to her, it would have been incestuous in him to marry, or to have sexual intercourse with the other sister, or even with her relatives, by consanguinity or affinity, to the eighth degree! Thus, on the death of James IV. of Scotland, his widow Margaret Tudor married the Earl of Angus. In 1524 she procured (by collusion with her husband) a sentence of divorce *à vinculo matrimonii* upon proof of his having been "precontracted." Sentence of nullity (that is, in the ecclesiastical phraseology, divorce *à vinculo matrimonii*) was thereupon pronounced; and the queen, freed from her fetters, gave her hand to Lord Methven, whom, however, she very soon dismissed by another suit in the ecclesiastical court, upon evidence that Methven was cousin, eight degrees removed, to her former husband, Angus; this constituting an affinity by the laws of holy church, and a just impediment to matrimony. In another case, Janet Betoun (the Lady Buccleugh of the "Lay of the Last Minstrel,") having married Simon Preston of Craigmillar, sued a divorce against him in the ecclesiastical court, not on the ground of any misconduct on his part, but on the ground that before their marriage she, the plaintiff, had had sinful intercourse with Walter Scott of Buccleugh, and that Buccleugh and Preston were within the prohibited degrees. On proof of these allegations, a sentence of divorce *à vinculo matrimonii* was pronounced. (Riddell's *Exposition of Ancient Consistorial Law*, Edinburgh, 1842.) These cases show most clearly what the law was in the Roman Catholic times on the points in question. Lord Coke tells, that there was a time in England when divorce *à vinculo matrimonii* might be had "because the husband had stood godfather to his wife's cousin." It was not by the axe that Henry VIII. extinguished his marriage with Anne Boleyn. He first carried her into the ecclesiastical court, and got a sentence against her, for an alleged precontract with Northumberland, and for his own criminal intercourse with her sister Mary. In the Roman Catholic times, the same ecclesiastical law prevailed throughout the island, and, indeed, governed the entire Christian world.

sonant to reason and religion, that, where the general law has failed to give a remedy, parliament has stepped in to provide one specially by passing a particular law in favour of those who can make out a case which will warrant its interference. The origin of this is important and instructive.

In Roman Catholic times marriage was regarded as a sacrament by the canon law; and being a sacrament it was deemed indissoluble. But at the Reformation the courts denounced, amongst other opinions of the Romish Church, the doctrine of a sacrament in marriage; "retaining the idea of its being of Divine institution in its general origin," but considering it in the light of a civil contract, which for its full completion had always required, in England at least, some religious solemnity. The character of marriage was thus materially altered; for since it was no longer to be deemed a sacrament, there was nothing, on that account, to render it indissoluble; and as the Reformers were about to revise the whole body of the canon law—which had become unsuitable to a Protestant country—they did not omit the matrimonial code. With this view, thirty-two commissioners were appointed to order and compile such laws ecclesiastical as should be thought convenient.[1] "A work was according composed for this purpose by Cranmer, and translated into Latin by Sir John Cheke and Dr Haddon, two of the restorers of classical literature in England." This work, having never received the royal confirmation, is not indeed law, but it is of great authority. It has been published under the title of "Reformatio Legum Ecclesiasticarum," and the articles on the subject of marriage and divorce are peculiarly interesting, as containing, in a short compass, the opinions of our first Reformers on matters which affect the civil rights of all men, as well as the highest of all the moral interests of society.

By these articles, when the husband or wife had committed adultery, a divorce was allowed, and the unoffending party might marry again. But if both were guilty, since both must fall under the same condemnation, the first marriage was not to be dissolved. Absolute desertion, protracted absence, mortal enmities, and lasting cruelty, were all adjudged to be lawful grounds of divorce. But reconciliation was inculcated wherever it could be obtained; and separations from bed and board were entirely abolished. It was, moreover, recommended that adultery should be punished by perpetual imprisonment or transportation for life; and if the offender were the husband, he was to return to the wife her fortune, and add to it one-half of his own; or if the wife, she was to forfeit her jointure, and all the advantages which by law, custom, settlement, or promise, &c., she might have otherwise derived from her marriage.

It is supposed that the regulations contained in this code on the subject of divorce were occasioned by the case of Parr, Marquis of Northampton, who had divorced his wife, Anne Boucher, for adultery, in the ecclesiastical court. For, according to the custom which then prevailed, it is probable that divorces had no certain and immediate effect beyond that. But since this statute was repealed by a law passed in the following reign,[2] "nothing is left of these proceedings except the advised and lasting belief of Cranmer, and his associates in reformation, that a more extensive liberty of divorce ought to be allowed."[3]

Apparently, in fact, it was allowed for more than half a century. For it has been observed by Sir John Stoddart, that from the year 1550 until the year 1602, marriage was not held by the church, and therefore was not held by the law, to be indissoluble.

The church, however, was still anxious to discourage as much as possible a second marriage after divorce; and accordingly it requires by the 109th canon that "in all sentences pronounced only for divorce and separation *à thoro et mensâ*, there shall be a caution and restraint inserted in the said sentence that the parties so separated shall live chastely, and neither shall they, during each other's life, contract matrimony with other person."

Mr Serjeant Salkeld lays it down that "divorce for adultery was anciently *à vinculo matrimonii*; and therefore, in the beginning of the reign of Queen Elizabeth, the opinion of the Church of England was, that after a divorce for adultery the parties might marry again. But in Foljambe's case, he adds, anno 44th Elizabeth, in the Star Chamber, *that opinion was changed*. And Archbishop Bancroft (it should be Whitgift) upon the advice of divines, held that adultery was only a cause of divorce *à mensâ et thoro*." The doctrine of indissolubility was thus not only re-established, but it operated in this country with a rigour unknown in Roman Catholic times; the various fictions and devices in the shape of canonical degrees and alleged precontracts, which then afforded so many loopholes of escape from its severity, having been each and all put an end to at the Reformation.

It may be reasonably doubted whether the decision in Foljambe's case was assented to by the Church of England as a body, for the Chamber of Convocation in the succeeding year re-enacted, word for word, the ecclesiastical constitutions of 1597. These, as subsequently confirmed by James I., are now a substantive part of the ecclesiastical law of this kingdom, being in fact the well-known canons of 1603, which have never been repealed or disturbed.

How far the conduct of the laity may have been affected by these proceedings, it is difficult to conjecture. What was the practical rule respecting second marriages in the reign of James I., or in that of his son, or during the time of the Commonwealth, we are but little informed. Mr Spence has conjectured that, in early times, the Court of Chancery, under its clerical chancellors, exercised jurisdiction to decree a divorce *à vinculo matrimonii*. There is no authority, however, for this, except some loose entries in Tothill's Transactions of the Court of Chancery. The first case which answered the double purpose of bastardizing the issue and enabling the parties to marry again is that of Lord Roos, in the reign of Charles II. The facts were shortly these. In the year 1666, an act was passed, bastardizing the children of Lady Ann Roos, by reason of her adultery; and thereupon her husband, Lord Roos, followed up this proceeding by obtaining from the spiritual court a sentence of divorce *à mensâ et thoro*. But these proceedings were incomplete for his purpose: and since "there was no probable expectation of posterity to support the family in the male line, but by the said John Manners Lord Roos," a bill was brought in entituled "An act for Lord Roos to marry again," and it enabled him to do so, and gave to the children born in such wedlock the character of legitimacy, and the capacity of inheriting.

According to the historians Burnet and Ralph, this bill was passed on political grounds, and with a political object, viz., to form a precedent which would enable Charles II. to separate from his first wife, by whom he had no children,

[1] 35th Hen. VIII. cap. 16, authorizes the king to name thirty-two persons, viz., sixteen spiritual and sixteen temporal, to examine all canons, constitutions, and ordinances, provincial and synodal, and to establish all such laws ecclesiastical as shall be thought by the king and them convenient to be used in all spiritual courts.

3d & 4th Edw. VI. cap. 11. An act that the King's Majesty may nominate and appoint two-and-thirty persons to pursue and make ecclesiastical laws.

[2] This is a private act, 5th & 6th Edw. VI., and consequently it is not printed in the authentic or common collection of the statutes.

[3] See Mackintosh's *History of England*, pp. 275, 276; and see an account of all the proceedings in Burnett's Reformation, vol. ii., pp. 90, &c., and 306; and Macqueen's *Practice of the House of Lords*, pp. 468, 792.

and to marry a second wife, after that separation, for the purpose of excluding the Duke of York from the throne. However that may be, unquestionably the bill was contested stoutly; seventeen bishops opposed, and three only supported it. But amongst those who supported it, was Bishop Cozens, whose masterly argument on this subject was afterwards published in a pamphlet, and is now preserved in "The State Trials."

The first example of an actual dissolution of the nuptial tie by parliament was in the case of the notorious mother of Savage, the *Countess of Macclesfield*. In that case the aid of the legislature was sought, because, in consequence of the skilful opposition set up by the countess in the spiritual courts, and the narrow maxims which there prevailed, she contrived to baffle all her husband's efforts to obtain a sentence of divorce *à mensâ et thoro*. The circumstances of the case, however, were so scandalous and flagrant, that it would have been an outrage upon every principle of justice to withhold relief; at the same time, it was so novel a proceeding to pass a bill of that nature, where there was not a sentence of divorce first obtained in the spiritual court, that a protest was entered against it by Lords Halifax and Rochester, because, as they said, they looked upon it as an ill precedent, and which might be of ill consequence in the future.

The next instance of a legislative dissolution of marriage was in the *Duke of Norfolk's case*. There also a sentence of divorce was refused by the ecclesiastical court, although the duke tried the experiment more than once. He recovered damages, however, at law, from the adulterer, Sir John Jermayne. And after his bill had been repeatedly rejected by the Lords, it became at last, in a new state of circumstances, successful in 1700. The leading counsel for the duchess (Sir Thomas Powys) complained that this was the first instance where an attempt had been made to obtain a divorce by act of parliament, without any sentence being previously obtained at Doctors' Commons. And the duchess herself protested against it in these emphatic terms:—"My lords," she said, "I had rather stand charged for high treason before your lordships than with this ignominious crmie. In the charge for high treason, the manner of trial and the ways of the proceeding are known, and so is the punishment. But your lordships are now creating new ways of proceedings, and a new law to punish me, and this for a crime supposed and alleged to be committed seven years past, in another reign, and after public indemnities in many sessions of parliament."

Such are the cases in which application was made to parliament before the commencement of the eighteenth century, to get rid of the consequences of a prior marriage.

By these means the right to obtain a divorce *à vinculo* was definitively established. It was established, however, in the rudest and most inconvenient manner; for the proceeding was a judicial one by a legislative process, and it had all the inconveniences which necessarily result from the discussion of such a question in a mixed and popular assembly. At first only a few divorce bills were passed—not more than five were carried through parliament before the accession of the House of Hanover. From 1715 to 1775 their number was sixty, that is to say, they averaged about one a-year. From 1775 to 1780 they had increased to seventy-four, that is to say, upon an average, to about three a-year: and from 1800 to 1852, they amounted to 110. Two of these, viz., *Lady Macclesfield's* and the *Duke of Norfolk's cases*, were without any sentence ecclesiastical: and several were without any previous verdict at law; for no standing orders of either house of parliament required the institution of these parliamentary proceedings until the year 1798.

In that year Lord Chancellor Loughborough called the attention of the House of Lords to the propriety of laying down certain general rules, which should precede the consideration of every case, and with which all parties who came before them to seek a divorce should be bound to comply. Accordingly he framed a series of resolutions; and by these resolutions it was not only required that a sentence of divorce *à mensâ et thoro* should have been pronounced before soliciting the bill, but that the entire proceedings in the ecclesiastical court should be delivered in upon oath at the bar of the House of Lords. They further required that the petitioner should attend the house, in order, if necessary, that he might be examined as a witness with reference to connivance or collusion, and also with reference to another point which has always been deemed of primary importance in judging of divorce bills, namely, whether he was, or was not, at the time of the adultery, living apart from his wife, and whether he had not, by deed or otherwise, released her from her conjugal duty by withdrawing his marital authority and protection. These resolutions, which were passed soon afterwards, had the effect of introducing a stricter practice than had previously obtained upon bills of this nature. By a subsequent order it was provided that no bill to disallow a marriage on the ground of adultery shall be received without a clause prohibiting the marriage of the offending parties. But this clause is struck out in committee or on the report, except in very peculiar cases. In *Dr Campbell's case*, where the adultery was incestuous, a provision to that effect was inserted in the Lords; but the Commons refused to ratify it.

Since the passing of Lord Loughborough's orders, all applications for divorces *à vinculo* have been supported by ecclesiastical sentences; and all have been supported by verdicts at law, or accompanied by circumstances which justified or explained the want of such verdicts.

Divorce bills in the Commons were originally determined in the whole house. But that unseemly and inconvenient practice was put an end to on the motion of Mr Labouchere in the year 1840, when the house referred them to a select committee of nine members, of whom three are a quorum. An instruction is given to the committee that they do hear counsel and examine witnesses for the bill; and also that they do hear counsel and examine witnesses against the bill, if the parties concerned think fit to be heard by counsel or produce witnesses. The proceedings in the Commons have acquired by this change a more judicial character; but it seems absurd that a case which has been already proved three times should be proved again.

Under ordinary circumstances a divorce bill may be obtained at the suit of the husband, but not at the suit of the wife. It may be obtained almost as a matter of right at the suit of the husband, when the wife is convicted of infidelity, and the conduct of the husband is irreproachable. But it cannot be obtained at the suit of the wife except in cases of aggravated enormity, such, for instance, as incestuous intercourse with the wife's relations, which precludes the possibility of future reconciliation.

The provisions of a divorce bill are in the discretion of parliament; and in this respect there is some advantage in bringing these questions under the jurisdiction of the legislature, as other courts are bound by rules. Parliament may mould and adapt its relief according to the facts and exigencies of the case. In former times, it was asked to provide, by express enactment, that the divorced wife should not be left in a state of destitution. According to the modern practice, this is a matter that is ordinarily effected by private arrangement; but it is never neglected. "There is in the House of Commons," Mr Macqueen observes (and the observation is perfectly correct), "a functionary called 'The Ladies' Friend' (an office generally filled by some member distinguished for his attention to the private business of the House), whose duty it is to see that the husband petitioning for divorce makes some suitable but moderate

provision for the divorced wife." This he attends to on all occasions; not by inserting the intended provision in the bill itself, for fear it should be rejected by the other House of Parliament, but by taking care that it is legally secured to her, before the bill has passed through committee.

It has sometimes been urged that cruelty should have a more extended signification; that other causes of divorce, or at least of separation from bed and board, should be allowed, such as mutual dislike, incompatibility of temper, neglect, severity, and repeated provocation; and that these separations might even be voluntary, if the parties were forbidden to seek such a dissolution of the marriage contract as would leave them at liberty to marry again. We cannot assent to these suggestions. The arguments against them are put so forcibly by Lord Stowell, and Hume and Paley, that they are absolutely unanswerable. "To vindicate the policy of the law," says Lord Stowell, "is no necessary part of the office of a judge; but if it were, it would not be difficult to show that the law in this respect has acted with its usual wisdom and humanity, with that true wisdom, and that real humanity that regards the general interests of mankind. For though, in particular cases, the repugnance of the law to dissolve the obligations of matrimonial cohabitation may operate with great severity upon individuals; yet it must be carefully remembered that the general happiness of the married life is secured by its indissolubility. When people understand that they *must* live together, except for a very few reasons known to the law, they learn to soften by mutual accommodation that yoke which they know they cannot shake off; they become good husbands and good wives, from the necessity of remaining husbands and wives; for necessity is a powerful master in teaching the duties which it imposes. If it were once understood that upon mutual disgust married persons might be legally separated, many couples who now pass through the world with mutual comfort, with attention to their common offspring, and to the moral order of civil society, might at this moment have been living in a state of mutual unkindness, in a state of estrangement from their common offspring, and in a state of the most licentious and unreserved immorality. In this case, as in many others, the happiness of some individuals must be sacrificed to the greater and more general good."

Our laws, while allowing divorces *à mensâ et thoro* in causes of adultery and outrageous cruelty, have wisely denied the like privileges to mere dislike, contrariety of temper, severity, neglect, or voluntary arrangements.[1] There is another cause, however, which so entirely frustrates all the objects of the marriage union that it may reasonably be doubted whether it should not be put on the same footing as cases of cruelty. We allude to wilful and obstinate desertion. Our old Reformers considered that this was so gross a breach of all the obligations, human and divine, which the husband and wife owe to each other, that in that case they would have allowed the deserted party to enter again into fresh nuptials. At the same time they were so impressed with the importance of keeping the contract unbroken, that before the complainant could obtain a dissolution of it, every kind of means was previously to be exhausted, exhortation and counsel, and even punishment, to bring the offender back to his duty; and in case of his absence an interval was prescribed of two or three years for the chance of his return, that nothing might be done with levity or rashness. In other Protestant countries that offence, when properly established, is considered a scriptural ground of divorce, even *à vinculo matrimonii*. In Scotland, also, if it be wilfully persevered in for four years, followed by a judicial requisition of conjugal rights on the part of the complainant, it warrants a dissolution of the marriage contract. In England, desertion must be coupled with cruelty before it can entitle the abandoned party to a sentence of separation; but in reason, in principle, and in its moral consequences, it can hardly be distinguished from cruelty itself.

Divorces *à mensâ et thoro* should, for the causes above adverted to, be allowed to the wife as well as to the husband, and desertion should entitle the wife to a remedy by way of alimony; but whether divorces *à vinculo* should be granted at the suit of the wife with the same facilities as at the suit of the husband, is a question which has elicited much difference of opinion. There are four instances in which wives have succeeded in procuring divorces *à vinculo* from parliament; but in these the husbands were guilty of other offences besides adultery, which were held either to preclude or absolve the complainants from further cohabitation.

For trying and determining questions of divorce three tribunals must now be resorted to—a court of law for damages against the adulterer; an ecclesiastical court for a divorce *à mensâ et thoro*, and the imperial parliament for a dissolving statute. The great expense and the long delay of these proceedings is a grievous hardship and oppression to individuals, and they amount in many cases to a denial of justice. Even in an unopposed suit the minimum expense of obtaining a sentence of divorce in the consistory court of London would vary from L.120 to L.140 at the least, and the case would occupy about two months. If it were opposed the expense would range from L.300 to L.500 and upwards (in heavy cases to much more), and it would take from one to two or three years before it was decided. The proceedings also do not terminate here; but there is an appeal to the court of arches, and from thence to the judicial committee. The expense of an action-at-law will depend in a great measure on the nature of the case, and the extent to which it is contested. The expenses in parliament, exclusive of counsel's fees, charges for witnesses, and solicitor's own bill, which amount, no doubt, to a considerable sum, average about L.200. With the other charges they would possibly be doubled; so that the total cost, under the most favourable circumstances, of obtaining

[1] Lord Brougham says, finely and justly, that "*all systems are supposed* to agree in this, that no dissolution of the nuptial union should be allowed upon the mere agreement of the parties to terminate their connection." (*Speeches*, vol. iii., p. 446.) And yet there were two periods in which the system was tried and failed,—one, in the corruption of manners, which hastened the decline of the Roman Empire; the other, in the utter subversion not only of manners but of law, morality, reason, and religion, which marked the French Revolution. In the former case the Romans adopted the motto, "that marriage, like other partnerships, might be dissolved by the abdication of one of the associates." But the historian tells us that "The specious theory was confuted by this free and perfect experiment, which demonstrates that the liberty of divorce does not contribute to happiness and virtue." (Gibbon, c. 44.) "The abuse of this privilege was justly held up to scorn and indignation by the Roman philosophers, poets, and satirists." (Seneca de Benef. iii. 16; Martial, vi. 7, lib. ix. epig. 16; Juvenal, Sat. vi. 223.) In the latter case the experiment was again attempted in France, and what was the result? "In the three first months the number of divorces in Paris, in 1793, amounted to 562, while the marriages were 1880; so that the proportion of divorces to marriages was not much less than one to three!—And in two years and three months 6000 are said to have taken place." (Quarterly Review, No. lvi., p. 509.) "Other legislatures," says Burke, "knowing that marriage is the origin of all relations, and consequently the first element of all duties, have endeavoured by every art to make it sacred. The Christian religion, by confining it to the pair, and by rendering that relation indissoluble, has, by these two things, done more towards the peace, happiness, settlement, and civilization of the world, than by any other part in the whole scheme of Divine Wisdom." (Letters on a Regicide Peace, Works, vol. viii., p. 174.) In many of the States of America, divorces may be obtained with comparative facility. But Chancellor Kent observes "that it is very questionable whether that facility has not been productive of more evil than good;" and he states that he has had reasons to believe, in the exercise of a judicial cognizance over numerous cases of divorce, that adultery was sometimes committed on the part of the husband for the very purpose of the divorce. (See Comment., vol. ii., p. 105.)

a divorce *à vinculo matrimonii* can hardly be less than L.700 or L.800; and when the matter is much litigated, it would probably reach some thousands. In Scotland, the average cost of rescinding a marriage is said to be L.20, and that when there is no opposition L.20 will suffice. In Scotland, also, it is not a privilege for the rich, but a right for all; and it is not unworthy of notice that out of ninety-four cases between November 1836 and November 1841 the parties litigant were almost all of the lower classes.

The three tribunals which are thus rendered necessary by parliamentary regulations for a divorce *à vinculo* would not be required provided these questions could be submitted to a court in which the country has confidence. One tribunal which can satisfy itself of the proper relief to be given or withheld, is better than three which distrust each other. The verdict at law is practically valueless; and if the proceedings before the legislature were as regular and searching as those in a court of justice, the ecclesiastical sentence would be so too.

The commissioners, therefore, recommend that applications for divorce *à vinculo matrimonii*, and all causes matrimonial, should be submitted in future to a new tribunal, consisting of a vice-chancellor, a common law judge, and a judge of the ecclesiastical court, and that they should sit for the purpose of trying these questions at specified times in different parts of the year. We would also recommend that there should be no appeal from their decision except to the House of Lords; and we think there would be convenience in directing that divorces *à mensâ et thoro* should likewise be referred to the same tribunal.

The commissioners add, "We cannot bring this report to a close without adverting to two questions of immense importance which are closely connected with the subject, though they do not fall within the terms of the inquiry proposed for our consideration. The one is, whether here, as in Scotland, the parties whose guilt has occasioned the divorce *à vinculo matrimonii* shall be restrained from intermarrying? The other, whether a Scotch divorce, upon grounds not allowed by the laws of England, shall operate as a dissolution for all purposes of an English marriage? With regard to the former question there is a standing order of the House of Lords which makes it imperative on any person petitioning for a bill for a divorce *à vinculo* to insert a provision in it prohibiting the person whose marriage with the petitioner shall be dissolved to intermarry with any offending party on account of whose adultery such marriage shall be dissolved; but this clause, notwithstanding many struggles to have it retained, is usually struck out without resistance in the committee. With regard to the latter question, a Scotch divorce of an English marriage, where the parties are *bonâ fide* domiciled in Scotland, will be binding and valid in the courts of that country upon any question of Scotch law affecting themselves, their children, or their property; but the courts of England will not recognise in some cases the binding validity of a Scotch divorce, since an English marriage, being a contract which, like other personal contracts, must be interpreted according to the law of the country in which it was made, cannot be dissolved by any proceeding in the courts of any other country for *English purposes*. The anomalies[1] arising from this conflict between the law of the two countries are strange and distressing to many families, and a remedy, if possible, ought speedily to be provided for them. We feel, however, that both these questions involve so many and such important considerations of national policy, and they relate to matters which in some respects are so far removed from the scope of our inquiry, that we forbear to do more than call attention to them."

Having considered the law of divorce in its different bearings, the commissioners sum up briefly the alterations and improvements which they think may be made in it with prudence and safety.

DIVUS, Diva, in *Antiquity*, appellations given to men and women who had been deified. Hence it is that upon medals struck on the consecration of an emperor or empress, the title of *divus* or *diva* is added; as DIVUS JULIUS, DIVO ANTONINO PIO, DIVO PIO, DIVO CLAUDIO, &c.

DIXMUDE (Flemish *Dixmuyden*), a town of Belgium, province of West Flanders, on the Yser, 12 miles N. of Ypres. Pop. (1851) 3984. It has an active trade in butter, which is said to be the best in Flanders.

DIZIER, St, a town of France, department of Haute Marne, arrondissement of Vassey, and 9 miles N. of the town of that name. It stands on the right bank of the Marne, which is here crossed by a bridge and begins to be navigable. St Dizier is surrounded by old walls, and is a handsome town. It has an elegant town-hall of recent construction, a hospital, a ruined castle, ship-building yards, iron foundries, cotton factories, and a considerable trade in wood. In 1544 it sustained a memorable siege by Charles V.; and here in 1814 the French forces twice defeated a part of the allied army. Pop. 6450.

DJEBAIL, Jebail or Gibyle (the ancient Byblus), a town of Syria, situated on an eminence near the sea at the foot of Lebanon, 30 miles S.W. of Tripoli. It is walled on the three sides towards the land, but open towards the sea, and is about a mile and a half in circuit. Nearly one-half of the space within the walls is occupied by gardens, and the population probably does not exceed 2000. It has an old castle built of stones of vast size, an old Maronite church, and a mosque. Its artificial harbour was destroyed during the time of the crusades. "The land of the Giblites," with "all Lebanon," was assigned to the Israelites by the original appointment; but it does not seem that they ever had possession of it. It was celebrated for the birth and worship of Thammuz, the Syrian Adonis. Djebail was taken possession of by the crusaders in 1100, and, after some vicissitudes, remained subject to them during their sway in the East.

[1] Lord Brougham says, in *Warrender* v. *Warrender* (2 Cl. & Finn. 540):—"The resolution in *Lolley's case* was that an English marriage could not be dissolved by any proceeding in the courts of any other country for English purposes; in other words, that the courts of this country will not recognise the validity of a Scotch divorce, but will hold the divorced wife dowable of an English estate, the divorced husband tenant thereof by the courtesy, and either party guilty of felony by contracting a second marriage in England. Upon the force and effect of such divorce in Scotland, and for Scotch purposes, the judges gave and indeed could give no opinion, and as there could be nothing legally impossible in a marriage being good in one country which was prohibited by the law of another, so if the conflict of the Scotch and English law be complete and irreconcilable, there is nothing legally impossible in a divorce being valid in the one country which the courts of the other may hold to be a nullity." Lord Lyndhurst, in his judgment in the same case, says:—"It must be admitted that the legal principles and decisions in England and Scotland stand in strange and anomalous conflict on this important subject. As the laws of both now stand, it would appear that Sir G. Warrender may have two wives; for having been divorced in Scotland he may again marry in that country, he may live with one wife in Scotland most lawfully, and with the other equally lawfully in England; but only bring him across the border, his English wife may proceed against him in the English courts, either for restitution of conjugal rights, or for adultery committed against the duties and obligations of the marriage solemnized in England; again, send him to Scotland, and his Scottish wife may proceed in the courts in Scotland for breach of the marriage contract entered into with her in that country. Other various and striking points of anomaly, alluded to by my noble and learned friend, are also obvious in the existing state of the laws of both countries; but however individually grievous they may be, or however apparently clashing in their principles, it is our duty as a Court of Appeal to decide each case that comes before us according to the law of the particular country whence it originated, and according to which it claims our consideration, leaving it to the wisdom of parliament to adjust the anomaly, or get rid of the discrepancy, by improved legislation."

DJIDDA, a seaport-town of Arabia. See Jidda.

DMITROV, a town of Russia, capital of a cognominal circle in the government of Moscow, 46 miles N. of the city of that name. Pop. 3000.

DMITROVSK, a town of Russia, capital of a cognominal circle in the government of Orel, and 56 miles S.W. of the city of that name on the Nerussa. Pop. 4000.

DNIEPER, a large river of Europe. See Russia.

DNIESTER, a large river of Europe. See Russia.

DOAB. This term in Hindustan means any tract of country included between two rivers. Thus, in the Punjaub there are five Doabs lying between the Indus and the Sutlej, and the tributaries of these rivers. The tract of territory, however, usually implied in the general term "the Doab," is that portion of the great political division of India known as the North-Western Provinces, which lies between the Jumna and the Ganges. This vast tract extends from Allahabad in the south to Saharunpore in the north, and is situated between Lat. 25. 20. and 30. 20. The soil is fertile, and produces millet, sugar cane, and barley, and is peculiarly adapted for indigo, which grows here in a wild state. The opium-poppy and tobacco have also been introduced. The territory contains many thriving and populous towns, and the whole country has been brought into a high state of cultivation by means of a magnificent plan of irrigation, comprising the main line of the Ganges Canal, which flows from Kurdwar through the centre of the Doab, with branches extending to almost every town in the province. The climate during the rainy season is hot, but during the winter is cool. By a treaty concluded with Scindia in 1803, the forts and territories of the Doab between the Jumna and the Ganges were ceded to the British; and the southern part of the Doab was ceded in 1801 by the reigning nabob of Oude. (E.T.)

DOBBERAN, a market-town and watering-place in the grand duchy of Mecklenburg-Schwerin, pleasantly situated in a valley, on a small river about a mile from the Baltic. Pop. about 3000. It is much frequented for its sulphurous springs and baths, and for sea-bathing. The grand duke has a summer residence here.

DOBELN, a town of Saxony, on an island formed by the Mulde, 32 miles E.S.E. of Leipzig. Manufactures—woollen and linen goods, fustians, hats. Pop. (1849) 7158.

DOBROUSCHA, a district of European Turkey. See Danube.

DOBSCHAU, or Dobsina, a town of Hungary, county of Gomör, on the Dobsina, 26 miles N. of Gomör. The inhabitants, amounting to about 4000, are mostly German. In the vicinity are rich mines of iron, copper, cobalt, and mercury.

DOBSON, William, an English portrait and historical painter, born at London in 1610. He served an apprenticeship to one Peck, a stationer and picture dealer; and while in his employment he began to copy the pictures of Titian and Vandyck, whose manner he ever after retained. Vandyck, happening to pass a shop in Snow Hill where one of Dobson's pictures was exposed, sought out the artist, and presented him to Charles I., who took Dobson under his protection, and not only sat to him several times for his own picture, but caused the Prince of Wales, Prince Rupert, and many others, to do the same. After the fall of Charles, Dobson was reduced to great poverty, and fell into dissolute habits. He died at the early age of 36.

DOBUNI, or Boduni, an ancient people of Britain, who possessed the territory which now forms the counties of Oxford and Gloucester. Both names seem to have been derived from the low situation of a great part of the country which they inhabited; for both *Duvn* and *Bodun* signify deep or low in the ancient language of Gaul and Britain. The Dobuni are not mentioned among the British nations who resisted the Romans under Julius Cæsar; and before the invasion of Claudius they had been so much oppressed by the Cattivellauni, that they cheerfully submitted to the Roman yoke. Cogidunus their prince was confirmed by Claudius in the government, and fewer garrisons were stationed in his dominions than in those of the other native princes. Consequently there are comparatively few Roman remains in that part of the country. The Durocornovium of Antoninus, and the Corinium of Ptolemy, are believed to have been the capital of the Dobuni at Cirencester, where there are still many marks of a Roman station. Clevum or Glevum, in the thirteenth *iter* of Antoninus, stood where the city of Gloucester now stands; and Abone, in the fourteenth *iter*, was probably situated at Avinton on the Severn.

DOCETÆ (from δόκειν, *to appear*), a name applied to those heretics in the early Christian church who held that Christ, during his life, had not a real or natural, but only an apparent or phantom body. From this circumstance they were also called Phantasiastæ, Phantasiodocetæ, Opinarii, and Opinati. The origin of this opinion is to be sought in the Greek, Alexandrine, and Oriental philosophizing about the imperfection or rather the essential impurity of matter. Traces of a Jewish Docetism are to be found in Philo; and in the Christian form it is combated in the writings of John, and more formally in the epistles of Ignatius. It differed much in its complexion according to the points of view adopted by the different authors. Among the Gnostics and Manichæans it existed in its worst type, and in a milder form it is to be found even in the writings of the orthodox teachers. The bolder docetæ assumed the position that Christ was born without any participation of matter; that his eating and drinking, and even his crucifixion, was a mere phantasm. They denied, accordingly, the resurrection and the ascent into heaven. Some held that another man was crucified instead of Christ. To this class belonged Dositheus, Saturninus, Cerdo, Marcion, and their followers, the Ophites, Manichæans, and others. The other, or milder school of Docetæ, attributed to Christ an ethereal and heavenly instead of a truly human body. Amongst these were Valentinus, Bardesanes, Basilides Tatianus, and their followers. They varied considerably in their estimation of the share which this body had in the real actions and sufferings of Christ. Clement and Origen, at the head of the Alexandrian school, took a somewhat subtle view of the incarnation, and Docetism pervades their controversies with the Monophysites. Docetic tendencies have also been developed in later periods of the church's history, as for example by the Priscillianists and the Bogomiles, and also since the Reformation by Jacob Böhm, Menno Simonis, and a small fraction of the Anabaptists.—(Niemeyer *De Docetis*, Halle, 1823–4.)

DOCIMASIA, or Dokimasia, in *Antiquity*, a probationary trial to which every Athenian citizen was subjected when he was appointed, either by lot or suffrage, to any public office. The docimasia consisted in a scrutiny into the character and qualifications of the individual, and was performed in public before certain judges: when, among other interrogations, it was asked whether he had been dutiful to his parents, had served in war, and if he were in possession of a competent estate.

DOCIMASTIC (δοκιμάζω, *to test*), assaying, proving by experiments. The docimastic art is otherwise called metallurgy. It is the art of assaying minerals or ores, in order to determine the nature and quantity of the metallic substances they contain.

DOCIMENUM Marmor, a name given by the ancients to a bright and clear white marble obtained from the quarries near Docimenos, a town in Phrygia. It was much used in building temples and other sumptuous edifices at Rome, and was accounted little inferior to the Parian in colour, but inferior in the compactness of its grain; and hence it was seldom used by statuaries.

DOCK,

Dock. An inclosed space for the reception of ships, either for their security or for the convenience of building or giving them repairs. This word has been derived by some, absurdly enough, from the Greek δεχομαι, to receive. That we had it, along with almost the whole of our sea-terms, from the northern continental nations, is sufficiently obvious. Thus in Flemish it is *dok;* Teutonic, *dock;* Swedish, *docka;* Suio-Gothic, *docka;* perhaps originally from *dekken*, to cover, protect, secure, inclose. The *dock* for inclosing the prisoner in a court of justice is evidently from the same origin.

Docks for the reception of ships are of two kinds, *wet* and *dry*.

A *wet dock* may either have gates to retain the water in it, so that ships shall constantly remain afloat, or be left open for the tide to flow into and ebb out of it at pleasure, either leaving it dry at low water, or with a certain depth of water remaining in it, according to its construction and situation with regard to the low-water mark, and to the ebbing of the sea at spring or neap tides. A wet dock without gates is generally distinguished by the name of a *basin*, which, however, is sometimes indiscriminately applied to a wet dock whether with or without gates.

A *dry dock* either becomes dry by the ebbing of the tide when the gates are left open, or by shutting the gates at low water, and pumping out whatever water may remain in it at that time, by the power of men, horses, wind, or, which is now most commonly performed in the Queen's dock-yards, by the steam-engine.

A *wet dock*, therefore, may be defined to be "a basin of water, in which ships may be kept afloat at all times of the tide;" a *dry dock*, a "receptacle in which every part of a ship can be examined, and its defects repaired." Ships may also be conveniently built in dry docks, and floated out by opening the gates; though in all dock-yards there are places set apart for this purpose, under the name of *slips*. A wet dock is called by the French *un basin;* a dry dock, *une forme;* and a slip, *une calle.*

The digging out the earth, and building the surrounding walls of masonry to prevent the sides falling in, and the preparation of the mortar and puzzolana, in the construction of a wet dock, are attended with great labour and expense. The two wet docks or basins of Cherbourg (see BREAKWATER), which are among the finest specimens that exist in the world, are estimated to have cost three millions sterling. The labour of excavation may sometimes be spared, and a series of wet docks or basins conveniently made, by turning the course of a tide-river through an isthmus, and placing a pair of gates at each end of the old channel. In this way were the new docks of Bristol constructed out of the bed of the Avon.

Wet docks. Wet docks are an improvement in navigation and commerce of the utmost importance, but of very modern date in this country; indeed, they owe their introduction entirely to a spirit of individual enterprise in commercial speculation. Liverpool might still have remained a poor fishing village but for its convenient docks, which not only produce to the town and corporation a large revenue, but ensure to the merchant every possible facility in refitting, loading, and discharging his ships, whatever their burden or their cargo may be, without being exposed to the risk of losing both ship and cargo in a rapid tide-river; and, at all events, to an unavoidable delay, occasioned by distance, the weather, or the state of the tides.

Hull is also greatly indebted for the extension of its commerce to its docks. Its old wet dock contains an area of ten acres nearly, and has accommodated at one time 130 sail of such vessels as frequent that port. Dock.

London, though unquestionably the first city in the world for its opulence, its commerce, and public spirit, and possessing within itself the powerful internal means of supporting docks, and all other conveniences that trade and shipping may require on the most extensive plans; London was the last to try the experiment of docks, except in the case of two spirited individuals, Mr Perry at Blackwall, and Mr Wells at Greenland Dock, both private ship-builders. Notwithstanding the total inadequacy of legal quays, which subjected the merchants to incalculable losses and delays, and in many cases proved absolutely ruinous; notwithstanding the effect of the heavy, expensive, and fatal embarrassments experienced regularly on the arrival of the West India fleets, and the annual losses, by plunder in the river, on West India produce, which alone were calculated to amount to L.150,000 to the proprietor, and L.50,000 to the revenue, and more than the double of those sums, including other branches of commerce; it was not till the year 1799 that prejudices and private interests were so far removed as to enable the merchants concerned in the West India trade to obtain an act of parliament to carry into execution a plan of docks, quays, and warehouses, for the convenience of that trade on the Isle of Dogs. Since that time the London Docks, St Katharine Docks, and various others, have been completed, to the incalculable benefit of the shipping interest and the commerce of the metropolis.

The docks of Liverpool were the first of the kind that were constructed in this kingdom, by virtue of an act of parliament passed in 1708; and from that period the town of Liverpool has rapidly raised itself from a poor fishing village, and a port for coasting vessels, to be the second commercial town and port in the empire; and the improvements carried out for the enlargement and better arrangement of the docks rendered it, for convenience and appearance, in this respect the very first, not even London excepted.

It appears from a statement, apparently authentic, that in the ten years ending with 1808 the number of ships which entered these docks was 48,497, tonnage 4,954,204; and the dock duties received L.329,566; and that in the following ten years ending in 1818 the number of ships was 60,200, the tonnage 6,375,560, and the amount of duties L.666,438; while for a single year (ending June 1853), no less than 20,490 vessels entered the docks, the tonnage of which was 3,889,981, and the amount of duties L.256,702—the largest amount yet received—the following being the return for the last ten years:—

Year.	Number of Vessels.	Tonnage.	Amount of Duties Received.
1843	16,606	2,445,278	L.188,286
1844	18,411	2,632,712	185,164
1845	20,521	3,016,531	223,247
1846	19,951	3,096,444	213,423
1847	20,889	3,351,539	244,435
1848	20,311	3,284,963	197,617
1849	20,733	3,639,146	224,224
1850	20,457	3,536,337	211,743
1851	21,071	3,737,666	235,527
1852	21,473	3,912,506	246,686
1853	20,490	3,889,981	256,702

It may also be observed, that this extraordinary increase has taken place since the abolition of the slave trade, which, it was formerly asserted, would be the ruin of Liverpool.

For a more detailed account of these docks, see the articles BIRKENHEAD and LIVERPOOL.

Dock.

The *West India Docks* on the river Thames were commenced in February 1800, and opened in August 1802. They consist of an outward and a homeward bound dock, and communicate by means of locks with a basin of five or six acres on the end next to Blackwall, and with another of more than two acres at the end next to Limehouse, both of which basins communicate with the Thames. The outward-bound dock is about 870 yards in length, by 135 in width, containing consequently an area of more than 24 acres; the homeward-bound dock is of the same length, and 166 yards in width, its area being little short of 30 acres; and the two together will contain with ease at least 500 vessels of from 250 to 500 tons. The whole are surrounded with a high wall, and, as a security against fire, the moment that a ship enters the dock the crews are discharged, and no person whatever is allowed to remain on board, or within the premises, the gates of which are closed at a certain hour. They are surrounded by immense warehouses, which are estimated to contain nearly 10,000 hogsheads of sugar, and an immense quantity of rum. The sum authorized by parliament to be raised for completing these docks and warehouses was L.1,200,000, and the total expense was probably not far short of one million and a half; yet on this capital the subscribers have been receiving from a very short period after their opening ten per cent., which, by the terms of the act, is not to be exceeded, and the term granted is limited to 21 years; but, like most other property, these docks have been greatly depreciated in value, and at present barely pay 8 per cent.

The next set of docks that were undertaken for the advantage of the trade of the capital was the *London Docks*. These docks are situated in Wapping, and are appropriated for the reception of all ships arriving in the port of London with wine, spirits, tobacco, and rice on board, but not exclusively, ships having on board other cargoes being admitted on the payment of certain fees. The act of parliament for incorporating the dock company was passed in 1800, authorizing them to raise a capital of L.1,200,000; but such was the number of houses to be purchased (we believe not less than 1200) occupying the site of the dock, that this capital by subsequent acts was extended to L.2,200,000, the dividends on which are limited, as in the West India Docks, to ten per cent. The great dock is 420 yards in length, and 230 yards in width, covering an area of twenty acres. A basin of three acres nearly connects it with the river. The warehouses are very magnificent; and the tobacco warehouse is the grandest and most spacious building of its kind in the world, being capable of containing 25,000 hogsheads of tobacco, and the vaults underneath as many pipes of wine. This single building, under one roof, is said to occupy upwards of four acres of ground. These docks were opened in February 1805.

The *East India Docks*, for the exclusive reception and accommodation of the East India ships, were the last in succession. The act for the incorporation of the company was passed in July 1803, authorizing them to raise a capital of L.200,000, which was afterwards increased to L.600,000, the dividend, as in the case of the two others, to be limited to ten per cent. These docks are situated at Blackwall. That for the reception of homeward-bound ships is 470 yards in length by 187 in width, containing a surface of rather more than 18 acres; the outward-bound dock is 260 by 173 yards, and is consequently something more than nine acres. An entrance basin of three acres nearly, and a spacious lock, connect them with the Thames.

Besides these there are the London Docks, the St Katharine's Docks, and the Victoria Docks in course of construction; of these, detailed accounts will be found under the article LONDON.

Hull has five docks, occupying with their basins a water area of $49\frac{3}{4}$ acres. A timber pond of 9 acres was constructed in 1853. The tonnage of shipping in 1852 was 799,866 sailing vessels, and 305,021 steam-vessels; the amount of dock dues L.433,755.

Southampton, the station for the West India mail and Lisbon and Alexandria steamers, is now constructing extensive docks and quays to accommodate their great and increasing traffic.

Grimsby Harbour has lately been greatly improved. Wet and dry docks have been constructed on the most approved principles, at an expense of L.250,000, and a canal cut into the Humber calculated to admit vessels of 1000 tons burden.

Hartlepool has also been of late years greatly enlarging its harbour and dock accommodation.

Sunderland has new docks of 18 acres extent, which were opened in 1850, and which can accommodate 300 sail.

Dundee has lately immensely improved her harbour and docks; besides two smaller docks, the wet dock now constructing will occupy $14\frac{1}{2}$ acres, the lock of which will be 60 feet broad.

Aberdeen has a wet dock, where the largest vessels may float in safety; it covers nearly 40 acres, with quay room of about 9000 feet.

Leith, the port of Edinburgh, has three wet docks, containing about 15 acres of water room. *Detailed accounts of these docks will be given under the names of the respective ports.*

The naval dry docks of the United States are among the most stupendous mechanical enterprises of that country; they are constructed at the navy-yards of New York, Philadelpia, Boston, Portsmouth, Norfolk, Pensacola, and San Francisco. By far the most extensive and magnificent of these structures is the granite dry dock of New York; 80,000 tons of stone have been used in its construction; the masonry foundations are 400 feet in length, and 120 in breadth. The main chamber is 286 feet long, and 30 feet broad on the bottom; 307 feet long, and 98 feet broad at the top within the folding gates; the height of the wall is 36 feet. The work was commenced in 1841, and took ten years to complete it; the aggregate expenditure was above L.430,000. For the docks at Cherbourg, see BREAKWATER.

Dry docks.

A dry dock, requiring to be perfectly water-tight, demands the greatest care in its construction. It is sometimes lined all round with wood, but more generally with masonry, mostly of hewn granite. The expense is very considerable, as the foundation, by means of piles or otherwise, must be well secured, all leakage prevented, and the culvers or drains properly constructed, to let in and carry off the water without its undermining the quays or piers. The cost of a complete dry dock will vary probably from L.20,000 to L.100,000, according to the size of the ships it is intended to admit, and the nature of the ground on which it is to be constructed. A dry dock may be *single*, or made to contain only one ship; or *double*, to contain two ships; but the former is the most common, because most convenient.

As it is of the utmost importance to preserve the water *in* a wet dock, and to keep it *out* of a dry dock, it may be proper to describe the different kinds of *gates* which are in use for this purpose.

Dock gates.

The most common, and on the whole perhaps the best and most convenient, are swinging gates, which open in the middle, and lie flat, one part against each wharf or side-wall of the passage leading into the dock or basin. The elevation of this kind of gate is represented in Plate CCVI., fig. 3. This kind of dock-gate requires to be made of great strength, with sound timber and good iron, and the gudgeons on which the hinges turn to be well secured into the stone abutments. Care also must be taken to make the bottom of the passage and the bottom of the gates perfectly plane and parallel, to prevent leakage, and give facility to their opening and shutting, which is usually assisted by rollers

fixed in a groove, and performed by means of a small capstern on each pier. Attached to the top of the gates is usually a foot bridge with railing, which, separating in the middle, opens and shuts with the gates.

The most simple but by no means the most effective contrivance for keeping out the water, is the wicket-gate, of which the plan and elevation are represented in Plate CCVI., figs. 5 and 6. It consists of three parts, which when opened are removed separately. This gate is rarely made use of unless where the abutments are not sufficiently strong, or their foundation sufficiently secure, to bear the weight of a pair of swinging gates.

A third kind of gate consists of a floating dam or caissoon, first introduced into this country by General Bentham, and first applied to the great new basin in Portsmouth dock-yard. They are built somewhat in the shape of a Greenland fishing-boat, sharp at the two ends, narrow, and deep in proportion to the depth of water at the entrance of the dock. The keel fits into a groove at the bottom of the passage, and the two slanting ends rise and fall in corresponding grooves cut into the two abutments. Of this kind of gate, figs. 1 and 2, Plate IV. represent the plan and elevation. By letting in the water, the caissoon sinks in the grooves, and acts as a closed gate; and by pumping out the water, or letting it out to a certain depth, the dam floats as the tide rises, and the narrow part, rising to the top, is readily disengaged from the grooves, and easily floated away as a boat. The advantages of these floating dams, as stated by General Bentham, are, that they are cheaper of construction than the gates heretofore in use for closing docks or basins; that they occupy less space, are more easily repaired, and one and the same dam is capable of being used, as need may require, in different places at different times. These caissoons have also the advantage of serving as bridges of communication for loaded carriages across the entrances they close, and they require much less labour than gates in opening or shutting up passages into docks or basins, since their occasional buoyancy may be obtained without pumping water or unloading ballast.

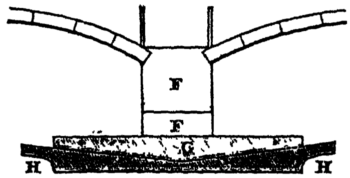
Fig. 7 represents a plan, and fig. 4 a sectional elevation, of a dry or graving dock, into which ships are taken to have their defects examined and repaired, coppered, &c., and in which, if necessary, as already observed, ships may be built.

Docking a ship.

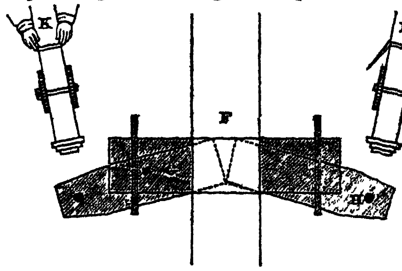
When a ship is brought into a dry or graving dock, she gradually subsides as the water flows out, till her keel rests upon the line of square blocks which are placed to receive it along the middle for the whole length; and on these blocks she is kept steady and upright by a number of shores or poles on each side, one of their ends being placed on the *altars* or steps of the dock, the other under the ship's bends and bottom. As a ship under repair generally requires something to be done to the main or false keel, or at any rate these parts require to be inspected, sometimes to shift the main keel, or to add to the whole length of the false keel, it was always found necessary in such cases to remove the blocks, in order to get at the bottom of the ship; but this operation could not be performed without the more serious one of first *lifting* bodily the ship clear of all the blocks, and suspending her as it were in the air. This process was performed by driving wedges simultaneously under the ends of all the shores that supported the ship; an operation that required from four to five hundred men to enable them to suspend a ship of the first rate. When the San Josef, a large three-decker, required her bottom to be examined in 1800, the assistance of almost every artificer in the dock-yard was found necessary to perform this process of lifting her; nor was this the only inconvenience; the ship, thus suspended, suffered very material injury by the pressure of her own enormous weight against the ends of the shores that supported her, such as forcing in her sides, straining the knees and all her fastenings, breaking the treenails, &c.

To remedy these glaring inconveniences and very serious injuries that ships thus placed were apt to sustain, and to effect a saving of time and expense in the operation, Mr (afterwards Sir Robert) Seppings, then master shipwright, and afterwards surveyor of the navy, contrived, several years ago, an improvement, as ingenious as it is simple, by which twenty men will suspend the largest ship in the navy, or rather, which amounts to the same thing, will disengage any one block that may be required, in the space of two or three minutes, without the necessity of suspending her at all; and, as a first rate in dock sits upon about fifty blocks, these twenty men will clear her of the whole of these blocks in about two hours; and as the saving of a day in completing the repairs of a ship is frequently the saving of a whole spring tide, the docking and undocking of a ship may make, and frequently has made, by this new method, the difference of a fortnight in the time of equipping her for sea.

The block of Mr Seppings, instead of being one solid piece, consisted of three wedges, or, more properly speaking, of one obtuse wedge and two inclined planes, which, when put together and placed under the ship's keel, appear as under, when viewed in the direction or line of the keel,



where G is the wedge on which the keel rests, having its obtuse angle equal to 170°, and HH are the two inclined planes, each having an acute angle of 5°. The wedge is of hard wood, having its two sides lined with iron; the two inclined planes are of cast iron. When one of these blocks is to be disengaged from under a ship's bottom, nothing more is required than a few smart blows alternately on the two sides of the two inclined planes, when they fly out, and the middle part or wedge drops; and the facility of thus disengaging any of the blocks is in proportion to the quantity of pressure upon that block. The strokes are usually given by a kind of catapulta or battering-ram, being a thick spar or pole moving on a pair of wheels, as KK.



This simple contrivance to get at any part of a ship's bottom by removing in succession all the blocks, without the necessity of lifting the ship, which the removal of any one block required to be done by the old method, is now universally adopted in all the dock-yards; and the Lords of the Admiralty marked their sense of the great utility of the improvement, by bestowing on Mr Seppings a reward of L.1000 for the invention.

Roofing the dock.

Another very material improvement introduced into her Majesty's dock-yards, is that of covering the dry docks and building slips with roofs. The rapid decay of our ships of war by that species of disease known by the name of the *dry rot*, attracted very general attention; its effects were well known, but a variety of opinions were entertained as

to its causes and its cure. It was quite obvious, however, that exclusion of air and moisture were the two great operating causes in giving activity to the progress of the disease (see DRY ROT); and that a ship in dock, stripped of her planking, and open to the weather in every part, alternately exposed to frost, rain, wind, and sunshine, must at least have her timbers differently affected, some swelled and water-soaked, others shrunk with heat, and others rifted with the wind and frost; and, if closed up with planking in this state, might be expected, at no great distance of time, to exhibit symptoms of decay. The workmen, too, in the open docks or slips, suffered from the vicissitudes of the weather no less than the ships, and their labour was frequently suspended, to the great detriment of the naval service. The measure of roofing over the docks and slips had long and repeatedly been suggested, but, either from prejudice or a false economy, it was only of late years carried into practice, but is now universal in all the yards. These roofs are generally constructed so as to be capable of having the sides and ends occasionally closed, according to the quarter from which the wind may blow; and by this contrivance the timber is prevented from rifting, as it is liable to do, by the action of a thorough draught of wind, and the health of the artificer is prevented from injury. The light is admitted through numerous windows placed in the roof. These roofs are in general supported on a row of pillars, and covered with plates of iron. Plate CCVI., fig. 8, exhibits the transverse section of a roof thrown over the head of the dock at Plymouth; its span, from A to A, being 95 feet 4 inches, and the extreme width, from B to B, 125 feet 4 inches, supported, on the principle of trussing, without a single beam. Another of the same kind was built at Chatham, whose span was 100 feet, and the extreme width 150 feet. These immense roofs, of which there are now some larger, were constructed after a plan of Mr Seppings. The cost of one of the dimensions above mentioned was from L.6000 to L.7000, which, great as it may appear, must be amply repaid by the superior quality and durability of the ships built under it; but the same roof, with little or no repair, serves as a covering for eight or ten different ships in succession. General Bentham, who, in his statement of *Services rendered in the Civil Department of the Navy*, seems to claim to himself all the inventions and improvements which have been introduced into the dockyards for the last forty years, carries his invention beyond a mere covering, and proposes to house over the docks and slips so completely as to afford "means of heating, warming, ventilating, and artificially lighting the interior at pleasure; the introduction of boilers or steam-kilns for bending the planks within the inclosure; the introduction of machinery for assisting in various operations, particularly the more laborious ones; the providing room for carrying on all the shipwright's work within the building; besides a variety of lesser works, such as it is found very inconvenient during the building or reparing of a ship to have executed, for example, in a smith's or carpenter's shop at a distance." Such buildings would not only be enormously expensive, but, in the present crowded state of the dock-yards, utterly impracticable. With regard to the invention of covered docks and slips, they have been used in Venice from time immemorial; and it appeared, from the evidence given by Mr Strange, the consul at that port in the year 1792, before the commissioners of land revenue, that two-and-twenty large ships had been under covered slips, some of them for sixty years nearly. At Carlscrona, also, there are several covered docks, and both Mr Nicholls and Mr Snodgrass strongly recommended the building of ships under cover nearly fifty years ago.

Hauling up ships on slips.

Among other experiments which were made in the dockyards for facilitating and expediting the repairs of ships, one may be mentioned, of which many persons were sanguine enough to think that the successful result was likely to be attended with most important benefits to the naval service. It was that of hauling up ships of war, of any dimensions, on building slips, instead of taking them into docks. It is no uncommon practice, at various ports of this kingdom, where there are neither artificial basins nor natural harbours, to haul vessels of the burden of fifty to two hundred tons, or probably larger, upon the beach, by means of capstans, to give them repairs; in like manner, most of the large fishing smacks are hauled up for security in tempestuous weather; but the practicability of hauling up ships of war, especially of the larger classes, was a matter of some doubt. Several frigates had, at various times, been hauled upon slips, when the docks were all occupied; and the ease with which the operation was performed induced the officers of the dock-yard to propose the hauling up of a line-of-battle ship. The Kent of 74 guns, was selected for this purpose. It was necessary, in the first place, to take her into a dock, to have proper bilgeways prepared, and to be stripped, so as to be made as light as possible; her weight being, according to a calculation made from the water she displaced when afloat, about fourteen hundred tons. To heave up this weight fourteen capstans were employed, and the number of men to work these were as under:

Nine men to each bar and swifter	1512
Eight men to hold on at each	112
Three men to each capstan, to attend the fall	42
Men on board the ship, and employed in other operations	450
Total of men employed	2116

The time occupied in hauling her up, after all the purchases were brought to bear, was forty minutes. The expense of preparing her, and the loss and wear and tear of the materials, was estimated at somewhere about L.2000.

The advantages which slips are supposed to possess over dry docks are many and important. They can be constructed at one-twentieth part of the expense; they occupy less space; they can be constructed on a steep or a shelving shore; and ships can be hauled upon them either in spring or neap tides; whereas a dry dock can only be made in particular situations, and, when made, ships can only be docked and undocked in certain states of the tides; from which circumstance a considerable delay and inconvenience are frequently experienced. It should be recollected, however, that a large ship must necessarily go into a dock preparatory to her being hauled up on a slip.

It has been considered as not at all impossible, as was suggested some time ago by Mr Perring, then the ingenious clerk of the check in Plymouth dock-yard, that the whole ordinary might hereafter be laid up on slips, which, if housed over, would unquestionably be the best means of increasing their durability, and preserving them from partial decay. Nor is it certain that in the end it would not be the most economical mode of preserving them. The expense, as appears from the *Estimates of the Ordinary of the Navy* for the year 1817, is L.187,000 for harbour victuals, harbour moorings and riggings, &c., besides L.135,000 for wages: the chief part of both which sums is on account of ships of war laid up in ordinary, none of which would be required by placing them on slips. It would indeed form a singular revolution in naval management, if ships hereafter should be laid up in ordinary on dry land, whilst the timber of which they are built was considered to be the best preserved under salt water; a process which, from some experiments recently made, promises fair to be the most effectual prevention of, and a probable cure for, the dry rot. (See DRY ROT.) This method of preserving timber has long been practised at Brest, Carthagena, and several other places on the Continent; and the only objection to it in some of our ports appears to be the attack of the worm known to naturalists by the name of *Teredo navalis*, whose bite is almost as destructive as the dry rot.

On the other hand, there are very many and serious objections, even were the measure practicable, of hauling up ships of the line in particular, to be laid in ordinary on slips. In the first place, the length of sea-beach which would be required is greater than probably all the dock-yards in the kingdom could furnish. Secondly, the three warrant officers who are now employed in each ship, and who are the best men in the service, being no longer necessary, would be turned adrift, and, in all probability, utterly lost to the navy. Thirdly, no large ship could be hauled on the slips without being previously taken into a dock to have her bilgeways fitted, and her bottom prepared for placing her on the slip. The time taken for this purpose must necessarily interfere with the other works of the yard; and after taking her out, the preparations for heaving her up, the capstans, blocks, purchase-falls, chains, and a variety of other articles, amount to a very large expense, not less, with the expense of the roof to cover the ship, than L.10,000 for each slip so hauled up.

Dock-Yards.

Previously to the reign of Henry VIII. the kings of England had neither naval arsenals nor dock-yards, nor any regular establishment of civil or naval officers to provide ships of war, or to fight them. They had admirals, however, possessing a high jurisdiction and very great power. (See the article ADMIRAL.) And it would appear, from a very curious poem in *Hackluit's Collection*, called *The Policie of Keeping the Sea*, that Henry V. had both ships, officers, and men exclusively appropriated to his service, and independently of those which the Cinque Ports were bound, and the other ports were occasionally called upon, to furnish, on any emergency. By this poem it also appears that Little Hampton, unfit as it now is, was the port at which Henry built

> ————his great *Dromions*
> Which passed other great shippes of the commons.

But what these *dromions* were no one can now tell; nor is it easy to conceive how the building and repairing of the Great Harry, which in the reign of Henry VII. was launched at Portsmouth, and cost L.15,000, was managed, considering the very rapid strides made at once from the small Cinque Port vessels, manned with 21 men and a boy, to this enormous floating castle. At that time it is well known that they had no docks, nor even substitutes for them.

The foundation of a regular navy, by the establishment of dock-yards, and the formation of a board, consisting of certain commissioners for the management of its affairs, was first laid by Henry VIII., and the first dock-yard erected under his reign was that of Woolwich. Those of Portsmouth, Deptford, Chatham, and Sheerness, followed in succession; and the last, excepting the new and unfinished yard of Pembroke, was Plymouth, which was founded by William III.

From the first establishment of the dock-yards to the present time, most of them have gradually been enlarged and improved by a succession of expedients and make-shifts, which answered the purposes of the moment; but the best of them possess not those conveniences and advantages which might be obtained from a dock-yard systematically laid out on a uniform and consistent plan, with its wharfs, basins, docks, slips, magazines, and workshops, arranged according to certain fixed principles, calculated to produce convenience, economy, and despatch.

Imperfections of the Queen's dock-yards. Neither at the time when our dock-yards were first established, nor at any subsequent periods of their enlargement as the necessities of the service demanded, could it have been foreseen what incalculable advantages would one day be derived from the substitution of machinery for human labour; and without a reference to this vast improvement in all mechanical operations, it could not be expected that any provision would be made for its future introduction; on the contrary, the docks and slips, the workshops and storehouses, were successively built at random, and placed whereever a vacant space would most conveniently admit them, and in such a manner as in most cases to render the subsequent introduction of machinery and iron railways, and those various contrivances found in the large manufacturing establishments of private individuals, quite impossible, even in the most commodious and roomy of her Majesty's dock-yards.

Proposed dock-yard on the Isle of Grain. The want of a systematic arrangement in our dock-yards, independently of machinery, and the enormous expenditure of money laid out on expedients, were questions of frequent discussion among naval men connected with the various administrations of the navy, and it was thought by many that it would be more desirable to construct an entire new dock-yard in some eligible situation, on an extensive scale, than to continue the *improvements* in the old ones. For this purpose, so early as the year 1765, the attention of the naval administration appears to have been turned to the Isle of Grain in the river Medway, along the shore of which is a fine expansive sheet of deep water. A dock-yard thus placed, on a systematic plan, would supersede that of Chatham on one side, and Sheerness on the other; but it was discovered on boring that the substratum was so loose and sandy as not to admit of a solid foundation. General Bentham, however, revived the project in the year 1800, which he seems to claim as his own, and painted the situation in such glowing colours, and as affording so many advantages for a grand naval arsenal, that the Lords of the Admiralty were induced to order a fresh set of borings to be taken. These were carried to the depth of 60 feet, and were everywhere found to consist of sand and mud, and totally unfit for the construction of basins, docks, and such solid buildings as are required for naval purposes.

On the peninsula of Northfleet. The imperfection of the naval yards to the eastward, the extension of the boundaries of France towards that quarter, the occupation of the greater naval port of Antwerp, and the uninterrupted command of the Scheldt and the ports of Holland by that power, rendered an enlargement of the means of naval equipment in the eastern dock-yards of England, or a new naval arsenal, indispensable. For the latter purpose the banks of the Thames were considered, in every point of view, as preferable to those of the Medway, the entrance into the latter being narrow, and having a bar across it, on which, at low water of spring tides, there is only 14 or 15 feet of water; whereas the navigation of the Thames is at all times uninterrupted, excepting by the badness of the weather. It communicates directly with the great market-town of London, in which every description of stores, foreign and domestic, is accumulated; and the trade of the Thames is the great source from which the fleet is supplied with seamen. The marshy peninsula of Northfleet was considered by naval men, who had turned their attention to the subject, to possess every possible requisite for the establishment of a royal dock-yard on an extensive scale. It was sufficiently removed from the mouth of the river to be completely sheltered, yet near enough for ships to proceed to sea with one wind. In the river between Northfleet and the sea there is plenty of water for the largest three-deckers to proceed with all their guns, ammunition, stores, and provisions on board, and almost with any wind, if moderate. A copious stream of good fresh water runs across the peninsula. The soil afforded plenty of earth suitable for bricks; the foundation was excellent for docks, slips, wharfs, and buildings of all kinds. It was sufficiently near the metropolis for speedy communication with the naval departments, and to receive stores in barges and the river craft. It was capable of being defended both on the land and river side; and when the whole was raised to the height of 12 feet with a dry gravelly soil, from the excavations of the docks and basins,

there could be no doubt of the healthiness of the situation. By the direction, therefore, of the Lords of the Admiralty, a complete survey was made by Messrs Rennie and Whidbey, who furnished a plan and estimate of a naval arsenal on a magnificent scale, within which all kinds of machinery were proposed to be employed for the making of anchors, sawing of timber, rope-making, block-making, &c.; iron railways to be laid from the timber wharfs to the timber fields, from thence to the mills and pits, and from them to the docks, slips, and workshops. The estimate, it appears, was about six millions sterling, which Mr Rose, in his letter to the late Lord Melville, calculates, with the fortifications and unforeseen expenses, to amount actually to ten millions; an expense which the minister did not venture to propose, though there can be little doubt that, when the case was fairly stated to the public, and the necessity of increasing our naval establishments to the eastward had been made apparent, no violent opposition would have been made to a measure which tended to keep up our naval superiority, and which was the less objectionable, as none of the money would have been taken out of the country, but circulated within it, to the encouragement of the arts, trades, and manufactures of the kingdom.

The board of revision made a detailed report on the merits of the plan, which, however, as the execution of it was delayed, was not printed; but the real reason was supposed to be, the very gloomy view taken by the commissioners of the disadvantages and imperfections of the present dock-yards, which Mr Rose seems to think, and indeed it is generally thought, is by no means warranted, and that those disadvantages in that report are greatly exaggerated, perhaps to enhance the value of the Northfleet plan, of which they seem to have been much enamoured. Imperfect as the old dock-yards are, chiefly from their having risen, as before observed, to their present state, by a succession of expedients and make-shifts, they are nevertheless far superior to any similar establishments on the Continent of Europe, if we except the arsenal of Cherbourg, whose magnificent basins (see BREAKWATER) are certainly unequalled, and the space surrounding them capable of being turned to every possible advantage. M. Charles Dupin, a French officer, who examined all our dock-yards with a skilful eye, pronounces them as by far superior to any on the Continent. We have heard much of the magnificent basins and the covered docks of Carlscrona, but the one has been greatly overrated, and the others are merely covered over with shed-like roofs; nor is there the least likelihood that the plan will ever be finished. We have been told likewise of the superior advantages of the naval arsenal of Copenhagen, where every ship has its appropriate storehouse. This plan has been adopted at Brest, and is reprobated there by every naval officer, and the officers of the yard, as most inconvenient, and a great waste of room, by having the most bulky and the most trifling articles stowed together in the same room. A better arrangement is that of having certain magazines appropriated to certain kinds of stores, and arranged according to the class or rate of ship for which they are intended, and, if appropriated or returned stores, the name of the ship to which they belong painted in front of the berth in which they are deposited. This is the system generally followed in our dock-yards.

The great point in which our naval arsenals were most defective was the want of wet docks or basins; which, however, was to a certain extent compensated at the two principal dock-yards of Portsmouth and Plymouth, by two magnificent harbours, in which the whole navy of England, when dismantled, may be moored and laid up in ordinary, in perfect security. The want of basins, however, in our dock-yards was most severely felt in time of war, when the expeditious fitting out of the fleet was so desirable. These wants are now happily remedied at all the great ports.

Idea of a perfect dock-yard.

The perfection of a dock-yard, then, independently of the advantages of machinery, which are but contingent, may be considered to depend upon one or more extensive basins, surrounded by spacious wharfs or quays. By means of these a prodigious saving of time, labour, and expense may be saved, in every stage of the progress of fitting out a ship for sea, from the moment she is launched from the slip, or taken out of a dock, as well as in dismantling a ship on returning to port to be paid off and repaired, or laid up in ordinary. For this purpose the docks and slips should occupy one of the sides of the basin, with working sheds for carpenters and joiners, smiths' shops, saw-pits, and seasoning-sheds between them. The ship, when completed on the slip and launched into the basin, may then be taken immediately into the adjoining dock to be coppered. From this she proceeds to the second side of the basin, in the corner of which is the ballast-wharf: the remainder of the side will probably be occupied by the victualling department, with appropriate stores in the rear for various kinds of provisions, and behind these the bakery, brewery, and slaughter-houses; on the wharf the iron tanks for holding water, now universally used for the ground tier, in lieu of wooden casks. These are taken on board next after the ballast, and, together with the superincumbent casks, would be filled in the ship's hold by means of flexible pipes to convey the water into them. The provisions would at the same time be taken on board at the same wharf, in front of the victualling stores. The third side might be appropriated to the ordnance department, with the gun-wharf extending along the whole side, and the gun-carriage storehouses, magazines, &c., in the rear. The fourth side would be occupied as the anchor wharf, with the cable storehouses, the sail lofts and stores, rigging loft, and magazines for various stores, in the rear. Behind these, again, on the first side, containing the dry docks and building slips, the ground would be appropriated to the reception, berthing, and converting of timber, from whence iron railways would lead to the saw-mills, saw-pits, and workshops, all of which would be placed on that side. On the second side a pond or basin for the victualling lighters and craft, with wharfs communicating with the manufactories and storehouses; the same on the ordnance or third side; and on the fourth side might be placed the ropery, hemp storehouses, tar-houses, with a basin for hemp-vessels, lighters, and the like. Communicating with the great basin on the building side, and also with the river or harbour on the shore of which the dockyard is to be formed, should be a mast-pond, with a lock for the storing of spars; in front the mast-houses, top-houses, capstan-houses, and a slip to launch the masts into the pond. Here also might be placed the boat-houses and boat-pond.

Advantages of a systematic dock-yard.

A peninsular situation like that of Northfleet, having at least three-fourths of its shore surrounded with deep water, is peculiarly favourable for some such arrangement as is here mentioned; as any number of locks and canals might be made to communicate with the river, so that ships coming into the basin might not interfere with those going out, nor the lighters and other craft bringing their several species of stores, with either or with one another. By such an arrangement a ship would be equipped for sea at half the present expense, and within half the usual time. A ship fitting out for an anchorage distant from the dock-yard, as at the Nore and Spithead, is liable to every inconvenience and delay, as all her guns, stores, provisions, and water, must be carried to her in dock-yard lighters and other craft, into which and out of which they must be hoisted and rehoisted; liable to delay from bad weather and contrary winds; to be stove alongside the ship, to the total loss or damaging of their cargoes: added to which is the loss of time in going backwards and forwards, especially to the artificers; the desertion of the men; the accidents from the upsetting of boats; and many other evils of a magnitude not easily to

be calculated, and exceeded only by the disappointment and vexation that unavoidably occur when ships are preparing for some particular and pressing service; all of which, when ships are fitted out in a basin for sea, are avoided. Here no delay, no embezzlement, no desertion, can take place. A ship in returning from sea may be docked and undocked into the basin with all her stores on board; and if to be paid off, instead of keeping the crew on board for weeks, till all the stores have been delivered into the dock-yard, the ship, by the proposed plan of basins, would remain securely in the basin, to be stripped at leisure by the riggers and labourers of the yard, and the crew become immediately available for other ships. Of the many superior advantages of wet docks for laying up ships to discharge, over the practice of exposing them in rivers or harbours, the shipping interest of the ports of London, Liverpool, Bristol, and Hull, can best testify, more especially that of London, which has taken the precaution to surround the docks with high inclosing walls, by means of which all access is debarred, and all possibility of embezzlement prevented.

Royal dock-yards.

From a brief description of the royal dock-yards as they now stand, a general idea may be formed of their several capacities, advantages, and defects. Taking them in succession, according to their vicinity to the capital, the first is

Deptford.—The front or wharf wall of this dock-yard, facing the Thames, is about 1700 feet in length, and the mean breadth of the yard 650 feet; the superficial content about thirty acres. It has three slips for ships of the line on the face next the river; and two for smaller vessels, which launch into a basin or wet dock, 260 by 220 feet. There are also three dry docks; one of them a double dock, communicating with the Thames, and the other a smaller one, opening into the basin. With these restricted means, even with an adequate number of workmen, its capacity for building ships, or for large repairs, must be very limited; but in the occasional repair of fourth-rates and frigates, and in the fitting out of sloops and smaller vessels, a great deal of work was performed at Deptford in the course of the war. The proximity of Deptford dock-yard to the capital is, however, of great importance, in the convenience it affords of receiving from this great mart all the home manufactures and products which may be purchased by contract for the use of the navy. It is, in fact, the general magazine of stores and necessaries for the fleet, from whence they are shipped off, as occasion requires, to the home yards, the outports, and the foreign stations, in store-ships, transports, coasting sloops, lighters, and launches, according to the distance to which they must be sent, to the amount, in time of war, of more than 30,000 tons a-year.

The principal stores deposited in Deptford dock-yard are small cordage, canvas, and ships' sails, to an immense amount; beds, hair for beds, hammocks, slops, and marine clothing; anchors under the weight of about seventy-five hundred, which are generally made by contract, all above that size being manufactured in the Queen's dock-yards.

The great magazines for the reception of these stores consist of a large quadrangular building, with a square in the middle, of three stories in height, with cellars underneath, in which are contained pitch, tar, rosin, and turpentine. The length of each side of these storehouses is nearly the same, differing from a square only by some 18 feet: this length is about 210 feet, but they vary in width from 46 to 24 feet.

Parallel to the west front of this quadrangle is the rigging-house and sail-loft, 240 feet, and nearly 50 feet wide, in which all the rigging is fitted for ships and stowed away, the sails cut out, made, and placed in proper berths for their reception, as well as for various other stores of a smaller kind.

On the eastern extremity of the yard is a long range of building, called the pavilion, in which the beds, hammocks, and slop-clothing are kept, and in which also are the house-carpenters', the joiners', and wheelwrights' shops. This building is about 580 feet long by 26 feet wide.

The remaining buildings usually appropriated to the different services of a dock-yard are all to be found at Deptford; a good blacksmith's shop, a plumber, glazier, painter shops, seasoning-sheds, store-cabins, saw-pits, mast-house, and pond, boat-houses, mould-loft, timber-berths, besides good houses and gardens for the principal officers, with several coach-houses and stables, so that the whole space is completely filled up in every part.

The number of men employed in this yard, in time of war, may have been about 1500, of whom about one-half were shipwrights and other artificers, and the other half labourers. There were, besides, in constant employ, 18 or 20 teams of 4 each, of horses, to drag timber and heavy stores.

Adjoining to the dock-yard is the victualling yard, the completest establishment of the kind, perhaps, in this or any other kingdom, though still capable of much improvement in the arrangement. Its frontage to the Thames is about 1060 feet, and mean depth 1000 feet, containing about 19 acres. This space is laid out in a more convenient manner than any of the dock-yards, for answering all the purposes which were intended. The general storehouses in front of the wharf wall, the cooperage, the brewery, the butchery, and the bakery, are all separate and complete in themselves; and a mill of such capacity as to grind corn to be made into biscuit sufficient for supplying the whole navy. Besides all the requisite offices for keeping the accounts, there are houses and gardens for eight of the principal officers of the yard.

The cooperage is spacious and well laid out. The staves are all sawed by hand, and this operation employed about 100 sawyers in time of war. Mr Brown of Fulham succeeded in making casks by machinery, by which 17 men in nine hours were able to complete 300 casks, whereas, by the ordinary method, the same number could only complete about 80. The brewery is well arranged, so is the bakery; and the butchery, consisting of a yard for keeping the cattle, with pens for sheep and hogs, two spacious slaughtering-houses, cutting and salting houses, by the abundant supply of water and constant washing, are kept in the cleanest order, and free from any disagreeable smell.

In the salting season 260 carcases have been slaughtered in each of the two days in the week appropriated to killing, and the hog hanging-house is capable of containing 650 carcases.

The total number of coopers, sawyers, bakers, and labourers employed during war, in the victualling-yard at Deptford, amounted probably to 1200 or 1300.

Woolwich Dock-yard.—This first and most ancient of the dock-yards presents a frontage to the river of 3680 feet, to which may be added 160 feet timber grove; the breadth now is very irregular, being from 250 to 900 feet. It has two docks with entrance from the river, and one dock with entrance from a large basin. This large basin has likewise an entrance into an inner basin, which is also of considerable size. There are besides three building slips for line-of-battle ships—one for steamers, one for corvettes, one for frigates; besides two smaller slips. There is also a boat pond. With all its imperfections, Woolwich yard, with a complete establishment of artificers, has been of great service both in the building and repairing of ships of all classes. Some of the largest and finest ships in the navy have been launched from Woolwich yard, among which may be mentioned the Nelson and the Ocean in former days, and latterly, the Trafalgar, Agamemnon, and Royal Albert. In fact, it is chiefly as a building yard that Woolwich ought to be considered as of much importance. It is stated in the *Eighth Report of the Select Committee on Finance* (1818), that "the wharf wall at Woolwich, owing to the action of the tide on

the foundation, is in a falling state, and in danger of being swept into the river, it being secured only in a temporary manner; and requires to be immediately rebuilt in a direction that will preserve it from similar injury hereafter, and prevent, in a great degree, that accumulation of mud which has, in the course of the last ten years, occasioned an expense of upwards of L.125,692, and would threaten in time to render the yard useless." The tides which sweep round the river wall keep a clear way along shore; but the deposits in the basin are considerable each time the caissoons are taken out, and the quantity of mud which is periodically removed in barges is a work of labour and great cost to the government.

It was found necessary to diminish the depth of the hold of the Nelson, in consequence of the Trinity Board having stated that no vessel drawing above 19 feet of water could be navigated down to Erith Reach, and one even of that draught not without difficulty and danger.

The magazines or storehouses are not in some respects to be compared with those of Deptford. They are more confined, and, owing to the narrowness of the yard, and the progressive additions made according as necessity required, there is little or no methodical arrangement. As far, however, as regards the building and repairing of ships, its conveniences are now very far superior to those of Deptford. The new mast-houses and mast-slip, the new mast-ponds, and the houses for stowing yards, topmasts, &c., with the locks under them, are all excellent; and two new and spacious basins complete these great conveniences. The timber-berths are well arranged, and the addition recently made to the western extremity of the yard allow the stacking of several thousand loads of timber, and of classing it according to the purposes to which it may be applicable; the new smithery, and the line of wharf wall has made the dock-yard of Woolwich an important and valuable naval arsenal.

Few of her Majesty's dock-yards have undergone greater improvement in late years than that at Woolwich. It has now got its steam factory, its steam kiln, steam saw-mills, foundry boiler shop, engineers' stores, smithery, &c., which render it very convenient for the repair of steam vessels and for the manufacture of engines.

Woolwich dock-yard seems to be complete in all the usual appendages of artificers, workshops, store-cabins, offices for the clerks, houses and gardens for the superintendent and principal officers of the establishment. The number of men employed during the war amounted to about 1800, of whom nearly 1100 were shipwrights and artificers, and the rest labourers. The number of spinners, knitters, layers, labourers, &c., in the ropery, might be about 260. Upwards of 20 teams of horses were daily employed in this yard.

One of the four divisions (the 4th, consisting of twenty-five companies) of royal marines is stationed at Woolwich, where barracks, an hospital, and all the other necessary buildings have been erected for their accommodation on shore.

Chatham Dock-Yard.—This dock-yard is situated on the right bank of the Medway, to which it presents a line of river wall at least 5000 feet in length; the width at the upper end being 400, in the middle 1200, and at the lower end about 800. The superficial contents may be estimated at about ninety-two acres. It has seven building-slips on the front, from which ships are launched into the river, all equal to the building of ships of the line, and three others for frigates and smaller vessels. In the same front are four dry docks communicating with the Medway.

The inconveniences arising from want of arrangement are less felt in Chatham than in any other of her Majesty's dock-yards; and it could not perhaps be materially improved, if on the same site an entirely new dock-yard was to be planned. At the southern extremity of the yard is the ropery, which is 1248 feet in length and 47½ feet in width, in which are employed about 250 persons. It is equal to the manufacture of every description of cordage required for the naval service, including the largest size cable, which is equal to 24½ inches. The hemp houses, 306 feet long by 36 feet wide, are equal to the stowage of 1600 tons of hemp and 3000 hauls of yarn. Next to these are the slips and docks, with the working-sheds and artificers' shops close in the rear, an excellent smithery, timber-berths, seasoning-sheds, deal and iron yard, &c.; and beyond these, on the eastern extremity of the yard, the officers' houses and gardens. The superintendent's house and excellent garden are situated nearly in the centre of the yard. The lower or north-eastern part of the yard is occupied by mast-ponds, mast-houses and slips, store boat-houses and slips, ballast-wharf, timber-berths, and saw-pits.

With all the advantages of interior arrangement, Chatham dock-yard still labours under that great defect to which most of the dock-yards are liable, from the injudicious manner in which the wharf walls have been constructed, without any regard being paid to the ebbing and flowing of the tide, or the currents of rivers, projecting in one part and retiring in others; the consequence of which is, that eddies are formed, and a constant accumulation of mud takes place along the line of the wall, and particularly in the openings of the dry docks, the slips, and the jetties. Of late years, however, since the attention of engineers has been called to this important subject, every opportunity is taken, in the repair of the wharf walls of the dock-yards, to correct the injurious effects arising from their improper direction.

There is no wet dock or basin in Chatham-yard; but the Medway, flowing along it in a fine sheet of water, in some degree answers the purpose of one. The whole river might indeed be converted into a magnificent basin, by pursuing the same plan as that adopted in forming the new docks at Bristol. This would be effected by cutting a new channel for the river through the chalk cliff below Frindsbury Church, opening out a little above Upnor Castle, and continuing the new channel across the marsh near St Mary's Creek, so as to open out into Gillingham Reach close to the fort. Here a basin might be constructed wherein ships might be equipped in all respects, ready for sea whenever the wind and tide should be favourable. At present, owing to the shallowness of the water and the crooked navigation from Chatham round Upnor Point, they are obliged to take in their water and ballast at one place, their stores and provisions at another, their guns, powder, and ammunition at a third; in consequence of which, a ship is usually longer in getting out to sea from Chatham than even from Deptford. If this new channel was made for the river, the whole space from the first reach below Rochester Bridge to St Mary's Creek, at the lower extremity of the dock-yard, might be converted into one magnificent basin.

Chatham being a building, a repairing, and refitting yard, the establishment of men was much greater in war than at Woolwich or Deptford; the number of shipwrights and other artificers, and labourers, being probably upwards of 2000, besides those of the rope-yard, which might amount to about 250.

A considerable piece of new ground (about 2000 feet in length by 200 in breadth) was added to the upper part of Chatham dock-yard, on which is erected one of the completest saw-mills in the United Kingdom, under the direction of Mr Brunell. The mill is situated on high ground, and close to the margin of a deep circular basin or reservoir of water, dug down to the level of the Medway, with which it communicates by a tunnel or subterranean canal, passing through the mast-pond. From the side of the reservoir opposite to the mill proceeds a long iron railway, supported on a double row of iron pillars; and alongside of

and parallel to this railway, on the side next to the dock-yard, are a continued series of stages for the reception of timber after it has been sawn into planks. A steam-engine of the power of thirty-six horses sets in motion all the operations of this mill, which may thus be briefly enumerated: *1st*, It drags up the large balks of timber through the canal into the reservoir as they are wanted. *2d*, It lifts up these large logs to the margin of the basin, carries them into the mill, and places them on the frame under the saws. *3d*, It saws them with the greatest nicety into planks of any required thickness. *4th*, It takes away the pieces thus sawn, and places them on carriages of iron. *5th*, It drives these carriages along the iron railway to any required distance. And, *6th*, It deposits the sawn timber on the stages, ready to be used in any part of the dock-yard where it may be required. From these stages it is conveniently conveyed to the docks or slips by single horse carts or trucks, with great expedition, down an easy descent, and without the least interference with any of the works carrying on in the yard. The whole of these operations are conducted by about ten, or at most twelve men.

This mill is supposed to be equal to the power of fifty saw-pits and nearly one hundred sawyers, and is capable of supplying the dock-yards of Chatham and Sheerness with all the straight-sawn timber that they can require. But the great advantage of the plan is in its application of the steam-engine to the management and arrangement of timber, by which the labour and expense of a great number of horses are saved, and, what is of still greater importance, the obstruction and impediments to the general services of the yard are avoided, which the dragging about of large balks to and from the saw-pits, with teams of four horses each, occasions in all the other yards. It allows, besides, the large space of ground which these saw-pits would occupy to be appropriated to other purposes.

The first division of royal marines, consisting of twenty-five companies, is stationed at Chatham, in excellent barracks, situated near to one of the extremities of the dock-yard.

There was formerly a small victualling depôt, situated partly in the parish of Chatham and partly in that of Rochester, from which the ships at Chatham and at Sheerness and the Nore received a supply of provisions and water. The premises are still in existence. The establishment consisted of an agent, clerk of the check, storekeeper, and their respective clerks, which, with the messengers, porters, labourers, &c., amounted to about ninety persons. Ships now obtain their supplies from Deptford or Sheerness, except fresh meat and vegetables, which are obtained on local contracts on demand.

Sheerness Dock-Yard.—The dock-yard is situated on a low point of land on the island of Sheppey, whose soil is composed of sand and mud brought from the sea on the one side and down the Medway on the other, and has so much contracted the mouth of this river as completely to command the entrance of it. The situation, in a military point of view, is a most important one, particularly from its vicinity to the North Sea and to the anchorage at the Nore; by which anchorage, and the works of Sheerness, the mouths of the Thames and the Medway are completely defended.

As a situation for a dock, the objections to which it was liable are now in a great measure removed. On account of the low swampy ground on which it stood, fevers and agues were at one time so prevalent, that shipwrights and other artificers were literally impressed and compelled to work at Sheerness. In process of time, however, a town sprung up close to the dock-yard, and with it some little improvement by drainage, embankments, and other measures. Still it continued, for a considerable time, an unhealthy and disagreeable place. As a dock-yard it was totally destitute of all convenience or arrangement; and the whole premises, mixed among wharfs and buildings belonging to the ordnance department, did not exceed fifteen acres of ground. The storehouses were dispersed in various parts of this space, and in so ruinous a state, that a ship hauled up in the mud was by far the best in the whole yard. It had two small inconvenient docks for frigates or smaller vessels. It was in fact a mere point of refitment, and might be considered as an appendage to Chatham.

From the very limited capacity of Sheerness, and the mighty preparations in the Scheldt, originated the magnificent project of the naval arsenal at Northfleet, which, from a change of political circumstances, and from the important improvements now carried out at Sheerness, is not likely ever again to be revived. The Finance Committee (*Eighth Report*) say they have learned "that the re-establishment and extension of the yards at Sheerness and Chatham may be considered as superseding, under any circumstance that can now be likely to occur, the plan contemplated for a naval establishment at Northfleet, on so extensive a scale as to require the expenditure of several millions."

These improvements are of sufficient magnitude to render any establishment at Northfleet wholly unnecessary, by making Sheerness as complete a dock-yard, and perhaps more so, than any other in her Majesty's dominions. Previously to carrying into execution this important undertaking, a committee of engineers and others was appointed, among whom were Watt, Huddart, and Jessop, whose plan was afterwards minutely examined, and some slight improvements suggested therein by Mr Rennie. The first stone was laid on the 19th August 1814, and the whole was completed at an expense not far short of one million sterling.

The advantages arising from the adoption of this plan are, *1st*, The addition of nineteen acres of ground to the dock-yard, by taking in the whole of the muddy western shore of the Medway, beyond the low-water mark of neap tides, and getting rid of the offensive and unwholesome smell which it perpetually occasioned. *2dly*, The construction of a wet dock or basin 520 feet in length by 300 in width, equal in surface to three and one-half acres, and capable of containing a fleet of ten sail of the line, in which they can take on board all their stores, ammunition, and provisions, and be equipped in all respects ready to proceed to sea. The entrance into this basin is from the Medway, through a lock that is closed by a floating dam-gate. *3dly*, The construction of three dry docks on the eastern side of the basin, and opening into it, each capable of holding a first-rate ship of the line. *4thly*, Ample space for constructing storehouses, mast-houses, mast-ponds, and slip, smithery, and artificers' workshops of every description. *5thly*, A further extension of the dock-yard, by the addition of ten or twelve acres of a low marshy tract of land called Major's Marsh, which was below the level of the sea, and the water kept out, as in Holland, by embankments, but is now raised several feet by the excavation of the basin, the dry docks, and the mast-ponds, so as to allow of drains to carry off the water to the shore, affording space for timber-berths, houses, and gardens, for all the officers of the dock-yard, as well as for the admiral commanding in chief at Sheerness and the Nore. These additions, together with some part of the premises held by the board of ordnance, make the whole area of the dock-yard of Sheerness amount to upwards of fifty acres. The wharf wall on the south side of the basin in front of the mast-houses is a hundred feet, and that on the river front sixty feet in width, lined on both sides with as complete a specimen of good and beautiful masonry of granite as any in the kingdom.

The usual officers, with their clerks, amounted during the war to about fifty; and the shipwrights, artificers, and labourers, to about eight hundred; the shipwrights being the most numerous, as the principal part of the work was con-

fined to the repairing of small vessels in the yard, but mostly to repairs of the fleet afloat at the Nore or in the Medway.

Portsmouth Dock-Yard.—Portsmouth dock-yard will always be considered as the grand naval arsenal of England, and the headquarters or general rendezvous of the British fleet. The dock-yard accordingly is by far the most capacious; and the safe and extensive harbour, the noble anchorage at Spithead, the central situation with respect to the English Channel and the opposite coast of France, and particularly with regard to the naval arsenal at Cherbourg, render Portsmouth of the very first importance as a naval station; and in this view of it, every possible attention appears to have been paid to the extension and improvement of its dock-yard. The noble steam basin, which was opened by the Queen in May 1848 with great ceremony, is one of the most important of the recent improvements. The sea wharf-wall of this yard, extending in the direction of north and south along the western shore of the harbour, is about 3900 feet in length, and the mean depth may be 2000 feet; and it in-closes an area of more than 100 acres.

In the centre of the wharf-wall, facing the harbour, is the entrance into the great basin, whose dimensions are 380 by 260 feet, and its area 2½ acres. Into this basin open four excellent dry docks, and on each of its sides is a dry dock opening into the harbour; and all of these six docks are capable of receiving ships of the largest class. Besides these is a double dock for frigates, the stern dock communicating through a lock with the harbour, and the head dock with another basin about 250 feet square. There is also a camber, with a wharf-wall on each side, 660 feet in length, and of sufficient width to admit of transports and merchant ships bringing stores to the dock-yard. In the same face of the yard are three building slips capable of receiving the largest ships, and a small one for sloops, besides two building slips for frigates on the northern face of the yard, and a smaller slip for sloops. The range of storehouses on the north-east side, and the rigging-house and sail-loft on the south-west side of the camber, are magnificent buildings, the former occupying nearly 600 feet in length, exclusive of the two intermediate spaces, and nearly sixty feet in width, and the two latter 400 feet. The two hemp-houses and the two sea-store houses occupy a line of building which, with the three narrow openings between them of twenty-five feet each, extend 800 feet. The rope-house, tarring-house, and other appendages of the ropery, are on the same scale. The two sets of quadrangular storehouses, and the two corresponding buildings, with the intervening timber-berths and saw-pits, at the head of the dry docks, issuing from the great basin, are all excellent, and conveniently placed. The smithery is on a large scale, and contiguous to it is an iron-mill, a copper-mill, and a copper refinery, at which is remelted and rolled all the old copper which is taken from ships' bottoms; and here, also, are cast bolts, gudgeons, and various articles of copper used in the navy. The number of sheets manufactured in one year of the war amounted to about 300,000, weighing above 12,000 tons; on which it has been calculated that a saving of at least L.20,000 was effected for the public, besides obtaining a good pure article. Most of these were constructed under the direction of General Bentham. (Bentham's *Services.*) At the head of the north dock are the wood mills, at which every article of turnery, rabetting, &c., is performed for the use of the navy, from boring the chamber of a pump to the turning of a button for a chest of drawers. But the principal part of these mills is the machinery for making blocks, contrived by that ingenious artist Mr Brunell (see BLOCK-MACHINERY), which cannot be regarded without exciting the highest respect for the talents and skill of the inventor.

The northern extremity of the dock-yard is chiefly occupied with seasoning-sheds, saw-pits, and timber-berths, the working boat-house, and boat store-house. On the eastern extremity are situated the houses and gardens of the superintendent and principal officers of the yard, the chapel, and the royal naval college.

Naval College.—The establishment of a college at Portsmouth for the education of young gentlemen for the navy was first formed in 1729 under the title of the Naval Academy. It contained 40 scholars, the sons of the nobility and gentry. In 1806 it was reorganized under the name of the Royal Naval College, and the number of scholars was raised from 40 to 70; of whom 40 were to consist of the sons of commissioned officers of the navy, and to receive their board, clothing, lodging, and education, free of all expense; the remainder to consist of sons of noblemen, gentlemen, civil and military officers, on payment of L.72 a-year. The age of admission from twelve and a half to fourteen years. A bond was required to be signed by their friends, in the penalty of L.200 for the first class, and L.100 for the second class, in the event of any young gentleman being withdrawn from the navy before he had served the proper time to qualify for the commission of lieutenant. (See article NAVY.) No student to remain at college longer than three years; at the end of which, or sooner if he shall have completed the plan of education, he was to be discharged into one of her Majesty's ships, the college time being reckoned two years of the six required to be served to qualify for such a commission. In 1837 the Royal Naval College for the education of young gentlemen for the navy was abolished, and by an order in council of 1838 it was reopened as an establishment for the scientific education of a certain number of officers and mates of the naval service, the latter to have passed both their examinations in seamanship and in navigation, and to remain one year in the college. At the end of six months an examination takes place, and a lieutenant's commission is awarded to the mate who attains the greatest proficiency. A limited number of commissioned officers of any rank are also permitted to study at the college, but no expense is incurred on their account: neither for the mates beyond their sea pay, and a customary allowance in lieu of provisions. The establishment at present consists of a governor (the first lord of the admiralty), a captain superintendent; a professor, mathematical master, instructor of fortification and mathematical drawing, and assistant in the observatory.

Naval Architectural School.—The number of students formerly did not exceed 24. Candidates for admission were examined at stated periods, the degree of merit alone giving preference of admission; the age of entrance from fifteen to seventeen, and the duration of their apprenticeship seven years. The students were lodged, boarded, and educated, free of all expense, and had the following yearly allowances: First year L.25, second L.30, third L.35, fourth L.40, fifth L.45, sixth L.50, seventh L.60. And at the expiration of their apprenticeship they were eligible to all the situations in the shipbuilding department of her Majesty's dock-yards, to be there employed as supernumeraries until regular vacancies might occur; provided the apprentice had completed the plan of education, and was certified by the professor to be properly qualified.

The consolidated establishment of the two foregoing departments consisted of a governor, who was the first lord of the admiralty for the time being; a lieutenant-governor, who was a post-captain in the navy, with a salary of L.800 a-year and apartments; two lieutenants of the navy, with L.200 a-year each, apartments; and an allowance for board; a professor who was a graduate of the university of Cambridge, with a salary of L.700 a-year, and apartments: a master of classics, history, and geography, with L.350 a-year and apartments; three assistant-masters, well skilled in mathematics, the first with L.250, the two others L.200 a-year each, with an allowance for house rent; besides masters for teaching draw-

ing, dancing, fencing, and the French language, and two serjeants of marine artillery. In addition to these, there was a superintendent of the school for naval architecture, a professional shipbuilder, brought up in one of her Majesty's dock-yards, to instruct the apprentices in the practical parts of shipbuilding. The school for naval architecture has also been abolished; but there is a central mathematical school for apprentices, with a principal at its head.

The professor of the naval college has the charge and keeps the rate of all the chronometers which may not be in use belonging to the navy; and all midshipmen in the navy are now required to pass their examination in the theory of navigation at the naval college. See NAVY.

The strength of Portsmouth dock-yard, during the war, was considerably above 4000 working men, of whom about 1500 were shipwrights and caulkers; the joiners and house-carpenters were nearly 500; the smiths 200 nearly; the sawyers 250; the riggers and their labourers nearly 200; the scavelmen and labourers of various kinds nearly 700; and the rope-yard employed about 350 persons.

Victualling Yard.—There were formerly two victualling establishments at this port; the one in Portsmouth town, the other across the harbour, at a place called Weevil; both of them inconveniently situated for supplying the ships with water and provisions, more especially such as may have to take them in at Spithead. The former consisted chiefly of provision-stores and magazines, with a tide-mill and a bakery; at the latter there were a cooperage and a brewery. The total number of persons employed, including the officers, at the two establishments, during the war, amounted to about 500. The victualling establishments are now consolidated at Gosport, and the Royal Clarence Victualling Yard is a very fine establishment.

The noble building for the reception of sick and wounded seamen (Haslar Hospital) is situated on the Gosport side of Portsmouth harbour. Being appropriated to the military branch of the navy, it will be described under the head of NAVY.

The second division of royal marines, consisting of twenty-seven companies, is stationed at Portsmouth, in barracks, which are inconveniently situated in the town; and eight companies of the royal marine artillery have their head-quarters at Fort Monckton, on the Mainland between Gilkicker Point and Haslar Hospital.

Plymouth Dock-Yard.—The naval station of Plymouth is inferior only to that of Portsmouth; and, in point of its more westerly situation, as considered with reference to the grand naval arsenal of Brest, it is superior even to Portsmouth. It possesses one of the finest harbours in the world, capable of containing, in perfect security at their moorings, not less than a hundred sail of the line; and by means of the breakwater it may boast of an excellent roadstead for eighteen or twenty sail of the line. The dock-yard, however, has only one basin, without gates, whose dimensions are 300 by 280 feet; but the excellent harbour of Hamoaze, on the western bank of which the wharf-wall extends, almost compensates for the want of others, especially as the depth of water allows the largest ships to range along the jetties, and receive their stores on board immediately from the wharf.

Plymouth dock-yard extends in a circular sweep along the shores of Hamoaze 3500 feet, its width about the middle, where it is greatest, being 1600, and at each extremity 1000 feet, making its superficial contents about ninety-six acres. The land front is about 2850 feet. In the line facing the harbour are two dry docks for ships of the first rate, a double dock for seventy-four gun ships, communicating with Hamoaze, and another dock for ships of the line, opening into the basin. There is, besides, a graving-dock without gates, and a canal or camber similar to that in Portsmouth yard, for the admission of vessels bringing stores into the yard; which communicating with the boat-pond, cuts the dock-yard nearly into two parts. There are five jetties projecting from the entrances of the dry docks into Hamoaze, alongside of which ships are conveniently brought when undocked. All these are situated between the centre and the northern extremity of the harbour line. On the southern part are three building slips for the largest class of ships, and two for smaller vessels; the outer mast-pond and mast-houses, timber-berths, saw-pits, and smithery. Higher up, on this end of the yard is an extensive mast-pond and mast-locks, with plank-houses over them; and, above these, three hemp magazines, contiguous to which is the finest ropery in the kingdom, consisting of two ranges of buildings, one the laying-house, the other the spinning-house, each being 1200 feet in length, and three stories in height. In the construction of the new rope-house no wood has been used excepting the shingles of the roof, to which the slates are fastened. All the rest is of iron. The ribs and girders of the floors are of cast iron, covered over with Yorkshire paving stone, and the doors, window frames, and staircases are all of cast iron, so that the whole building may be considered as proof against fire.

The northern half of the yard, besides the docks and basin, with all the appropriate working sheds and artificers' shops, contains a cluster of very elegant stone buildings, ranged round a quadrangle, the longest sides being about 450 feet, and the shortest 300 feet. Within the quadrangle are also two new ranges of buildings, in which iron has been used in the place of wood. These buildings consist of magazines for different kinds of stores, rigging-houses, and sail-lofts. The northern and upper part of the yard is occupied by a range of handsome houses, with good gardens behind them, for the commissioner and the principal officers of the yard, the chapel, the guard-house, and pay-office, stables for the officers, and the teams, and a fine reservoir of fresh water for the supply of the yard.

Plymouth is not only a good building and repairing yard, on account of its excellent docks and slips, and the great length of line along the Hamoaze, but also a good refitting yard, and was fully occupied during the war with the refitment of the western squadron, employed in the constant blockade of Brest. The number of men borne on the establishment of this yard might have been about 3000, of which about 800 were shipwrights.

A large addition has been made to Plymouth yard by the fine establishment of Keyham steam factory which adjoins it, with a water frontage of about 1300 feet, and with a steam basin 630 feet by 560 feet, and another in progress 700 feet by 400 feet.

Plymouth Victualling Establishment.—The Royal William Victualling Yard stands on the eastern entrance to Hamoaze, on about eleven acres of ground; adjoining four acres on its south side, on which stand two small forts, and a reservoir containing about 8000 tons of water, which supplies the fleet—the water being brought from Dartmoor.

Plymouth Hospital is a handsome building of stone, or rather a series of separate buildings, regularly arranged, in which respect, as admitting a freer circulation of air, it is perhaps superior to that of Haslar. See NAVY.

The third division of royal marines, consisting of twenty-five companies, are stationed at Plymouth. The barracks are conveniently situated at Stonehouse, very airy, and sufficiently spacious.

Pembroke Dock-Yard.—This dock-yard has been established but a few years comparatively, and is intended merely as a building-yard. It is situated on the southern shore of Milford Haven, not two miles from the town of Pembroke. It includes an area of about sixty acres, its surface descending in a gradual slope to the water's edge, along the shore of which there is a frontage of about 2350 feet. It has a dock, and 14 building slips, 6 of which are for first-rates. The

Dock-Yards.

largest ship of the royal navy, the Duke of Wellington, 131 guns, was launched from this yard.

Other Yards.—In addition to the foregoing, there are several small naval yards—at Deal, Harwick, Leith, and Cove of Cork, as well as at Gibraltar, Malta, Antigua, Jamaica, Halifax, Bermuda, Kingston (Canada), Cape of Good Hope, and Trincomalee.

Dock-Yard Officers.—The management of the dock-yards is intrusted to a superintendent, either a rear-admiral or captain; a master attendant and his assistant; master shipwright and assistant; a store-keeper, store-receiver, and director of police—a force which has only of late years been introduced for the protection of the yards.

Ordinary of the Dock-Yards.—At each of the ports where there is a dock-yard, Pembroke excepted, a certain number of ships when put out of commission, or new ships not commissioned, are laid up in what is called a state of ordinary; and such ships were formerly placed under the immediate charge of the commissioner, the masters attendant, and other officers of the dock-yard. But a new system has been adopted, both with regard to the fitting of the ships for their better preservation, while thus unemployed (see Dry Rot), and also as to the care and management of them by warrant officers living constantly on board. See Navy.

Capacity of a Dock-Yard.—The capacity of a dock-yard for building, repairing, and refitting ships of war, depends upon so many circumstances that it scarcely admits of calculation; chiefly, however, on the facilities afforded by a suitable arrangement of dry docks, building slips, and basins, and on the number of shipwrights and other artificers borne on the strength of the yard. In building new ships, where the materials are at hand, and no interruptions occur, the capacity may be ascertained to a tolerable degree of accuracy. To complete the building of a seventy-four gun ship, it is calculated that the labour of one man would be required for 18,000 days, or of eighteen men for 1000 days, or about fifty-four men to finish her in the space of one year. A dock-yard, therefore, with 500 good shipwrights, might be expected to launch from eight to ten 74-gun ships every year, if the conveniences of the yard admitted them all to be employed on building; but this kind of ship is now supplanted by ships of 120 and 130 guns, requiring a relative increase of hands. With regard to repairs, they are so various and so uncertain, that it would be next to impossible to form any calculation that should at all approach to the truth. A writer well versed in naval matters, in attempting to prove the sufficiency of our dock-yards, without having recourse to private merchant yards during war, has stated, that by a uniform system of management, "the annual regeneration of ships of the line may be safely reckoned at *twelve sail*, and that of frigates at *eight sail*;" and that, besides, there might be docked for casual repairs, in the course of one year, *two hundred and sixty-seven sail* of ships and vessels of war." (*Letter to Lord Melville on the General State of the Navy*, 1810.)

Management of the dock-yards, &c.

When Henry VIII. first established a regular king's dock-yard at Woolwich, he appointed a board, consisting of certain commissioners, for the management of all naval matters; and it is curious enough, as appears from the *Pepysian Collection of Manuscripts* in the university of Cambridge, that the regulations which he made for the civil government of the navy, and which were in the reign of Edward VI. revised, arranged, and turned into ordinances, form the broad basis of all the subsequent instructions given to the several officers to whom the management of the civil affairs of the navy has been committed. (*First Rep. Nav. Rev.*)

Commissioners of the navy.

The commissioners of the navy then consisted of the vice-admiral of England, the master of the ordnance, the surveyor of the marine causes, the treasurer, comptroller, general surveyor of the victualling, clerk of the ships, and clerk of the stores. They had each their particular duties; and once a-week they were ordered to meet at their office on Tower Hill, and once a-month to report their proceedings to the lord high admiral.

In 1609 the principal officers for conducting the civil affairs of the navy were suspended, in consequence of many abuses being complained of; and other commissioners were appointed, with powers to manage, settle, and put the affairs of the navy into a proper train, and to prevent, by such measures as might appear to be necessary, the continuance of the many great frauds and abuses which had prevailed. A similar commission was renewed in 1618, which in a full and minute report detailed and explained those frauds and abuses.

That commission, which ended on the death of James I., was renewed by his successor, and remained in force till 1628, when it was dissolved, and the management of the navy was restored to the board of principal officers, as established by Edward VI.

In the disturbed reign of Charles I. the navy was suffered to go to decay; but by the extraordinary exertions of Cromwell it was raised to a height which it had never before reached, but again declined under the short and feeble administration of his son.

Duke of York the lord high admiral.

On the restoration of Charles II. the Duke of York was appointed lord high admiral; and by his advice a committee was appointed to consider a plan he had drawn out for the future regulation of the affairs of the navy, at which he himself presided. "In all naval affairs," say the commissioners of revision, "he appears to have acted with the advice and assistance of Mr Samuel Pepys, who first held the office of clerk of the acts, and was afterwards secretary of the admiralty; a man of extraordinary knowledge in all that related to the business of that department, of great talents, and the most indefatigable industry."

The entire management of the navy was now in the hands of the duke, as lord high admiral, by whom three new commissioners were appointed to act conjunctly with the treasurer of the navy, the comptroller, the surveyor, and clerk of the acts, as principal officers and commissioners of the navy. A book of instructions, drawn out by Mr Pepys, was sent to the navy board for its guidance. A rapid progress was made in the repair and augmentation of the fleet; but being called away, in consequence of the Dutch war in 1664, the example of zeal and industry set by Mr Pepys was not sufficient, in the duke's absence, to prevent neglect and mismanagement in every department except his own.

New set of commissioners.

From 1673 to 1679, the office of lord high admiral being put in commission, at the head of which Prince Rupert was placed, the king, through Mr Pepys, arranged all naval affairs; but in the latter year, when the duke was sent abroad, and Mr Pepys to the Tower, a new set of men were made commissioners of the navy, who, without experience, ability, or industry, suffered the navy to go to decay. "All the wise regulations," say the commissioners of revision, "formed during the administration of the Duke of York, were neglected; and such supineness and waste appear to have prevailed as, at the end of not more than five years, when he was recalled to the office of lord high admiral, only twenty-two ships, none larger than a fourth-rate, with two fire-ships, were at sea; those in the harbour were quite unfit for service; even the thirty new ships which he had left building had been suffered to fall into a state of great decay, and hardly any stores were found to remain in the dock-yards." He re-appointed Mr Pepys as secretary of the admiralty; he set about an inquiry into the characters and abilities of the first ship-builders in England; and by the advice of Mr Pepys he joined Sir Anthony Dean, eminent in that profession, with three others, to the former principal officers in a new commission. The old commissioners were directed entirely to confine their attention to the business of a committee of accounts. To each of the new ones was

intrusted a distinct branch of the proposed reform; and it appears that, highly to their credit, "they performed what they had undertaken in less time than was allowed for it, and at less expense;" having completed their business to the general satisfaction of the public two months before the Revolution.

The business of the navy, thus methodized and settled, remained undisturbed by that event. The commissioners of revision justly observed, that "the great work of re-establishing the fleet, and restoring order, industry, and discipline, in the dock-yards, accomplished in so short a time by the commissioners then chosen, with so much care, proves, in the most convincing manner, how much depends on having the civil affairs of the navy placed under the management of men of real ability, professional knowledge, and uninterrupted industry."

Commissioners of naval inquiry and revision.

It will readily be supposed that the vast increase of our naval force since that time has necessarily required many additional orders and regulations, some of which, from circumstances, were not compatible with each other; some were given to one dock-yard and not to another; others in one yard became obselete, while they continued to be acted upon in another; so that there was no longer that uniformity in the management which it is so desirable, indeed, so essentially necessary, to preserve. From the year 1764 to 1804, when his Majesty appointed a commission "for revising and digesting the civil affairs of his navy," the attention of the lords of the admiralty and the navy board had frequently been directed to this important subject; but owing to various causes nothing was done to forward so desirable an arrangement, except that Sir Charles Middleton (afterwards Lord Barham), when comptroller of the navy, classed and digested under distinct heads, in a book for that purpose, all orders and regulations prior to the year 1786. The commissioners of naval inquiry, appointed in 1803, state the necessity of revising the instructions, and digesting the immense mass of orders issued to the dock-yard officers, and regret that a work of such utility should not have been completed. The late Lord Melville, to whom the navy is perhaps more indebted than to any single individual, and who, from the active part he had long taken in its concerns, was well aware of the irregularities and disorder which prevailed in the dock-yards, on his appointment to the administration of naval affairs determined to carry into execution a complete system of reform and of uniform management in all the several departments. The commission consisted of Admiral Lord Barham, John Fordyce, Esq., Admiral Sir Roger Curtis, Bart., Vice-Admiral Domett, and Ambrose Serle, Esq. They made fifteen distinct reports, the date of the first being 13th June 1805, of the last the 6th March 1808; all of which except two have been printed by order of the House of Commons, and mostly carried into effect by orders in council. One of the two not printed is an inquiry into the state of the navy at different periods, and of naval timber; the other relates to the formation of a new dock-yard at Northfleet.

Uniform system of management introduced.

From these reports were established, for the first time, in all dock-yards, one uniform system of management, by which it was hoped incalculable advantages would have been derived to the public, in the preventing of frauds, in the saving of labour and materials, and consequently time and expense, and in securing better workmanship in the construction of ships, which is perhaps of all other considerations the most important; but the system was cumbrous and expensive, and has given way to other more judicious management.

Commissioners of the navy.

The management of the dock-yards, and of all the civil affairs of the navy, was formerly intrusted to certain commissioners appointed by patent, of whom the comptroller of the navy and three surveyors, and seven other commissioners, formed a board at Somerset House, for the general direction and superintendence of the civil concerns of the navy, subject to the control of the lords commissioners of the admiralty. At most of the home yards and of the foreign yards was a commissioner of the navy, who was always a naval officer of the rank of captain. The foreign yards over which a commissioner presided, were Bermuda, Cape of Good Hope, Gibraltar, Halifax, Jamaica, Malta, Quebec, Kingston, including the lake establishments and Trincomalee, which, with the five belonging to the home yards, Woolwich (including Deptford), Chatham, Sheerness, Portsmouth, and Plymouth, made the whole number of commissioners of the navy amount to twenty-four. The salary of each of the home commissioners was L.1000 a-year, that of the comptroller L.2000. The salary of the foreign commissioners L.1200 a-year, except that of the Cape of Good Hope, which was L.1800, and Trincomalee L.3000 a-year. They were also entitled to liberal superannuations when unfit for further service; and, at their death, their widows received a pension for life of L.300 a-year. All these have been swept away, and the two great departments, the navy and the victualling offices, have been consolidated with the admiralty, and the details of the business placed under five principal officers, each having a separate department. These are, 1. the surveyor of the navy; 2. the accountant general; 3. the storekeeper general; 4. the comptroller of the victualling and transports; 5. the director general of the medical department. There is also a director of engineers and architectural works, who superintends all the great works carried on in the dock and victualling yards.

Victualling establishment.

To each of the dock-yards at Deptford, Portsmouth, and Plymouth, are victualling establishments for supplying the fleet with provisions and water; and also at Cork, Cape of Good Hope, Gibraltar, Malta, Jamaica, Halifax, Trincomalee, and Rio de Janeiro. The victualling board at Somerset House consisted formerly of a chairman and deputy chairman, the former with a salary of L.1200, the latter of L.1000 a-year, and five other commissioners with salaries of L.800 a-year each; a secretary to the board, and a secretary to the committee of accounts; a registrar of securities, and 136 clerks, with salaries varying from L.800 to L.80 a-year, according to their class and length of service. These have all been abolished, and, as before stated, consolidated with the admiralty.

The transport board having been dissolved at the end of the war, its twofold duties were divided between the navy and victualling boards; those which concerned the hiring of transports devolved on the commissioners of the navy, and those which related to the sick and hurt department on the commissioners of the victualling board, on whom also devolves the direction and superintendence of all the naval hospitals at home and abroad. These have also merged in the admiralty.

Officers of the dock-yard; their duties.

The principal officers of an established dock-yard, prior to 1833, were, 1. the commissioner; 2. the master attendant; 3. the master shipwright; 4. the clerk of the check; 5. the storekeeper; 6. the clerk of the survey; to which have recently been added the subordinate officers of timber-master, and the master measurer. By the new regulations, the commissioner has been superseded by a superintendent, the clerk of the check and clerk of the survey abolished, as well as the master measurer, and a store-receiver substituted for the timber-master. Many subordinate officers have also been abolished, and the whole system of working the men, keeping the accounts, &c., simplified and amended; and some idea may be collected of the diminution of the expense by the simple fact, that, in the ordinary estimate of the navy for 1817 the establishment of officers in Portsmouth yard was L.50,065, whereas in 1833 it was only L.19,803; and in 1853, L.20,121. To this, however, must now be added the salaries of officers employed in the steam factory, which amount to L.2555.

The principal officers in the factory are,—1. the chief engineer and inspector of machinery; 2. his assistant; 3. assistant inspector of machinery; 4. foreman of the factory; 5. foreman of boilermakers; 6. pay-clerk and book-keeper.

Hitherto the men were usually employed by what was called task and job; but they are now wholly put upon day pay. The total number of men employed in the yards may be stated, in round numbers, at 10,000.

Defence of the yards.

In the year 1847 the workmen of the several dock-yards were enrolled into a corps for the defence of the yards, and certain numbers were trained to the use of the great gun exercise; so that each of the dock-yard battalions have some artillery attached to them. This valuable body of men are annually drilled, and, considering the short season during which they are under arms, present a most creditable appearance. Their uniform consists of blue frock-coat and trousers, and a helmet recently substituted for the chaco.

The commissioners of naval inquiry (*Sixth Report*) clearly expose the "combination of self-interest which has been permitted to exist against the public in all the persons who were concerned in the accounts of job-work, and the fictitious manner of making up those accounts." The quarter-men, for instance, were paid wages according to the amount of the earnings of the men under their own superintendence, and the accounts of those earnings were taken by themselves. General Bentham has furnished an instance of the gross abuses which existed under the old system of job-work. "By the regulations of the navy board, nothing less than L.5, 2s. was to be paid for the *smallest* repair of a thirty-four feet launch. If the above sum should be found inadequate to the payments for the work done to a boat of this class, the repair was then to be denominated a *middling* repair; in which case L.11, 1s. was the exact sum. Again, if this sum were insufficient, the repair was to be denominated a *large repair;* and in this case, although the value of the workmanship might have exceeded the sum of L.11, 1s. only by a few shillings, the expense was to have appeared in the account as doubled, and set down at L.22, 2s., and nothing less was to be the exact sum paid for this work." Nothing was more common, in estimating a man's wages, than to find him working three or four tides, and very often three nights, in one day. (Bentham's *Services*, &c.) The whole of this system is now done away; and the consequence is, that as much work is performed, and turned out in a more workman-like manner, and a very large saving effected in pay and materials, by resorting to day-pay, under proper superintendence. The effect of the change of system, and the reductions that were made in the establishments at home and abroad, reduced the expense in the year 1817 from about L.556,000 to L.286,000, making a saving of L.270,000 a-year. (J. B—W.)

DOCKET or DOCQUET (Lat. *documentum*), in *Law*, a small piece of paper or parchment, containing an abridged entry of an instrument or proceeding, for convenience of reference: also, an alphabetical list of cases in a court, &c.

DOCTOR (Lat. from *doceo, I teach*), a person who has passed all the degrees of a faculty, and is empowered to teach or practise the same. Hence the terms doctor in divinity, doctor in physic, doctor of laws.

The establishment of the *doctorate*, as now in use amongst us, is ordinarily attributed to Irnerius, who himself drew up the formulary. The first ceremony of this kind was performed at Bologna, in the person of Bulgarus, who began to profess the Roman law, and on that occasion was solemnly promoted to the *doctorate*, that is, installed *juris utriusque doctor*. But the custom was soon transferred from the faculty of law to that of theology; the first instance of which was given in the university of Paris, where Peter Lombard and Gilbert de la Portrée, the two leading divines of those days, were created doctors in theology, *sacræ theologiæ doctores*.

Spelman conceives the title of doctor not to have been in use till after the publication of Lombard's Sentences, about the year 1140. Others, however, go much higher, holding Bede to have been the first doctor at Cambridge, and John de Beverley at Oxford, where the latter died in 721. But Spelman contends that doctor was not the name of any title or degree in England till the reign of King John, that is, about the year 1207. As to the qualifications or course of study necessary to obtain the degree of doctor in the different faculties of theology, law, and medicine, see UNIVERSITIES.

Doctor of the Law, a title of honour among the Jews. The investiture, if we may so speak, of this order, was performed by putting a key and a table book in their hands; and it was in allusion to this ceremony, some authors imagine, that our Saviour, when speaking of the doctors of the law, says—"Wo unto you, lawyers! for ye have taken away the key of knowledge; ye enter not in yourselves, and them that were entering in ye hindered."

Doctor of the Church, a title given to certain of the fathers whose doctrines and opinions have been the most generally followed and authorized. We usually reckon four doctors of the Greek Church and three of the Latin. The former are, St Athanasius, St Basil, St Gregory Nazianzen, and St Chrysostom; the latter are St Jerome, St Augustin, and Gregory the Great. In the Roman breviary there is a particular office for the doctors, which only differs from that of the confessors by the anthem of the Magnificat and the lessons.

DOCTOR is also an appellation adjoined to a specific epithet, expressing the merit of some eminent schoolman. Thus, Alexander Hales is called the irrefragable doctor; Thomas Aquinas, the angelic doctor; St Bonaventure, the seraphic doctor; John Duns Scotus, the subtile doctor; Raimond Lully, the illuminated doctor; Roger Bacon, the admirable doctor; and so on.

DOCTORS' COMMONS. See COLLEGE OF CIVILIANS.

DOCUMENT, in *Law*, some written muniment produced in proof or support of anything asserted.

DODD, DR WILLIAM, an unfortunate English divine, eldest son of the Rev. William Dodd, many years vicar of Bourne, in Lincolnshire, was born in May 1729. He was sent, at the age of sixteen, to the university of Cambridge, where he was admitted a sizar of Clare Hall in the year 1745. In 1750 he took the degree of B.A. with credit, being upon that occasion in the list of wranglers. On leaving the university, he married a young lady of the name of Perkins in 1751, was ordained a deacon the same year, and priest in 1753, and soon became a popular and celebrated preacher. His first preferment was the lectureship of West-Ham and Bow. In 1754 he was also chosen lecturer of St Olave's, Hart Street; and in 1757 he took the degree of A.M. at Cambridge. He was a strenuous supporter of the Magdalen Hospital, which was founded in 1758, and soon afterwards became preacher at the chapel of that charity. By the patronage of Bishop Squire, he in 1763 obtained a prebend at Brecon; and by the interest of some city friends got himself appointed one of the king's chaplains; soon after which the education of the Earl of Chesterfield was committed to his care. In 1766 he went to Cambridge and took the degree of LL.D.

At this period, the estimation in which he was held by the world was sufficient to give him the expectation of preferment, and hopes of riches and honour; and these he

might probably have realized had he possessed a portion of common prudence and discretion. But, impatient of his situation, and eager for advancement, he unhappily fell upon means which in the end proved the occasion of his ruin. On the living of St George, Hanover Square, becoming vacant, he wrote an anonymous letter to the chancellor's lady, offering three thousand guineas if, by her assistance, he was promoted to the benefice. This letter having been traced to him, a complaint was immediately made to the king, and Dr Dodd was dismissed with disgrace from his office of chaplain. After residing for some time at Geneva and Paris, he returned to England in 1776. He still continued to exercise his clerical functions, but his extravagant mode of life soon involved him in difficulties. To meet the demands of his creditors he forged a bond on his late pupil Lord Chesterfield, for L.4200, which he actually received. But he was detected, committed to prison, tried at the Old Bailey, found guilty, received sentence of death, and, in spite of numerous applications for mercy, executed at Tyburn on the 27th June 1777. Dr Dodd was a voluminous writer, and possessed considerable abilities, with but little judgment and much vanity. An accurate list of his various writings is prefixed to his *Thoughts in Prison*.

DODDRIDGE, Philip, D.D., an eminent Dissenting minister, was the son of an oilman in London, and born there 26th June 1702. At his birth, according to his biographer Orton, "he was thrown aside as dead;" and in his feeble childhood his parents, who were exceedingly pious, took great pains in his instruction. He was left an orphan at the age of thirteen; and after having completed his classical studies at various schools, he was placed by Dr Clarke of St Albans under the tuition of the Rev. John Jennings, who kept an academy at Kibworth, Leicestershire, for the education of Dissenting ministers. Previous to this he had hesitated greatly in regard to his course in life. Some of his friends pressed him to study law; and the Duchess of Bedford, hearing of his inclination for the ministry, offered to defray the expenses of his education and provide him a living in connection with the Church of England. Both of these offers, however, he declined on conscientious grounds. On the removal of his tutor to Hinckley, Doddridge began to preach to the vacant congregation; and on the death of Jennings in 1723, he succeeded to the charge of the academy, which he at first opened at Market-Harborough. Having been soon afterwards chosen minister of a large congregation of Dissenters at Northampton, he removed his academy to that place, where he continued to preside over it for twenty years. Here he was especially known as a preacher for the earnestness with which he sought to elevate the spiritual tone of his communion, and to urge the practical realities of the Christian life. His prelections were attended by students from all quarters of the kingdom, and were remarkable for the facility with which he brought the results of an extensive course of various reading to bear on almost every topic of divinity. He received the degree of D.D. from the university of Aberdeen. In 1751 his health began to break down amid the incessant labours of the pulpit and the academy. On the 30th September he embarked for Lisbon, where he died the 13th October 1751. His remains were interred in the burying-ground belonging to the British factory at Lisbon, and a handsome monument was erected to his memory in the meeting-house at Northampton.

As a writer Dr Doddridge was exceedingly voluminous. The works on which his fame principally rests are his *Rise and Progress of Religion in the Soul*, and his *Family Expositor*. Among his minor works, his *Treatise on Regeneration, Sermons on the Education of Children*, and the *Life of Colonel Gardiner*, are best known. His *Theological Lectures* were published after his death by Dr Kippis; and among his collected hymns are some of the finest now in use among the Dissenters. Biographies of Doddridge have appeared from the pens of Jacob Orton and Dr Kippis. The best delineation of his character will be found in his *Private Life and Correspondence*, collected in five vols. 8vo, by one of his descendants. His works have been collected and edited by Williams in 10 vols. 8vo.

DODECAGON, in *Geometry*, a regular polygon consisting of twelve equal sides and angles.

DODECAHEDRON, in *Geometry*, one of the platonic bodies, or regular solids, contained under twelve equal and regular pentagons.

DODO, an extinct bird, one of the largest, or rather the largest of the feathered race, but so unwieldy and helpless as to be captured without the least difficulty. It is said to have been found in Madagascar when that island was first visited by the Dutch, but is now an extinct species. It is described as having had only four or five short black feathers in the place of wings, a small tuft of curly feathers for a tail, short-unwebbed toes, and a bill of very large size. The foot of a dodo is preserved in the British Museum, and the head exists in the Ashmolean Museum at Oxford. The beak resembles that of the auk, and the foot has a resemblance to that of the penguin, though not palmated.

DODONA, the seat of one of the most celebrated of the ancient oracles, was a Pelasgic town of Epirus in the north of Greece. Though the oracle of this town was the oldest and one of the most sacred of antiquity, ranking indeed with those of Delphi and Ammon, no vestige either of the city of Dodona or of the temple of Jupiter has been discovered in modern times. Even the district of Epirus in which the town was situated has become matter of discussion. By some it is believed to have been in Thesprotia, by others in Molossis. It is not impossible that, as the town was somewhere on the boundary line of these two divisions, it may have been included at one time in Molossis, and at another in Thesprotia. The antiquity of the Dodonean oracle was very great. Its name occurs frequently in the Homeric poems, where it is said that the service of the temple was performed by the "Selli—men with unwashed feet, sleeping on the ground." The actual abode of the deity, however, was not at first a temple, but the stem of a great oak-tree, the wide-spreading branches of which when shaken by the wind were believed to be giving voice to the mystic utterances of the inhabitant within. From this circumstance the oak-grove of Dodona was feigned by some of the ancient poets to be endowed with the power of speech. By others it was said that the responses were delivered by the doves that nestled in the branches. Hence the constant allusions in the classics to the "Chaoniæ aves." In later times it was maintained that the oracular Peleiæ, or Peleiades, were not doves, but priestesses, to whom Jupiter sent a message by the doves to devote their lives to the service of his temple at Dodona.

With the rise of Delphi, the general repute of Dodona began to decline, though its local celebrity remained unimpaired. The final destruction of the oracle is attributed to the Ætolians, who near the end of the third century B.C. ravaged Epirus and levelled the temple of Jupiter with the ground. So complete was the destruction of the place, that not a fragment of house or temple now remains that can with certainty be identified as belonging to the ancient Dodona. Colonel Leake has endeavoured to fix the site of the old oracle at the modern Kastritza, but his arguments are far from being conclusive.

DODONIAN (*Dodonæus*), in *Antiquity*, an epithet given to Jupiter, from his temple in the grove of Dodona. See Dodona.

DODRANS, in *Antiquity*, three-fourths of the *as*, or of anything; and as a measure of length, 9 inches.

DODSLEY, Robert, an eminent bookseller and ingenious writer, born in 1703 at Mansfield, Nottinghamshire, where his father is said to have been a schoolmaster. His first poetical attempts seem to have been made when he was a servant in the family of the Hon. Mrs Lowther; and were published under the title of the *Muse in Livery*. This was followed by an elegant little satirical farce called *The Toyshop*, the hint of which is said to have been taken from Randolph's *Muse's Looking-glass*, and which, having obtained the approbation of Pope, was acted at Covent Garden with great success. The profits accruing from the sale of these two publications enabled him to establish himself as bookseller in Pall-Mall; and his own merit and enterprising spirit soon procured him eminence in that profession. In 1737 a new piece entitled *The King and the Miller of Mansfield* was received with undiminished applause. His immediately subsequent farces, however, were not so popular. In 1738 he published a collection of his dramatic works in one volume 8vo, under the modest title of *Trifles;* which was followed by the *Triumph of Peace*, a masque, occasioned by the treaty of Aix-la-Chapelle, and a fragment on *Public Virtue*. Dodsley was also the author of the *Economy of Human Life*, a work which acquired considerable celebrity; but for this it is supposed he was not a little indebted to the mistaken opinion which long prevailed of its being the production of Lord Chesterfield. The name of Dodsley is from this period associated with much of the literature of his time. Among other things he projected *The Annual Register*, *The Museum*, *The World*, and *The Preceptor*. To these various works Horace Walpole, Akenside, Soame Jenyns, Lord Lyttleton, Lord Chesterfield, and others, were contributors. It would be tedious and uninteresting to enumerate the various other literary enterprises in which he engaged. His own latest production was a tragedy entitled *Cleone*, and was received with even greater enthusiasm than his earlier pieces. His personal character was excellent; he observed the strictest integrity in all his dealings; and lived on easy terms with authors of the highest rank and genius. Dodsley died at Durham while on a visit to a friend, 25th Sept. 1764.

DODWELL, Henry, a learned controversial writer, was born at Dublin in 1641. He was descended from an Irish family who had once been possessed of considerable property in Connaught, but who having lost it at the rebellion had settled at York in 1648. By the death of his parents Dodwell was reduced in early life to the greatest poverty. In 1654 he was sent by his uncle to Trinity College, Dublin, of which he was soon afterwards chosen scholar and fellow. To avoid taking orders he relinquished his fellowship in 1666, and resided for some time at Oxford, Dublin, and London successively. In 1688 he was elected Camden professor of history at Oxford, but was deprived of his professorship in 1691 for refusing to take the oaths of allegiance to William and Mary. Retiring to Shottesbrooke in Berkshire, and living on the produce of a small estate in Ireland, which he had at first generously relinquished in favour of a near relation, he devoted himself to those literary labours in chronology and church politics on which his fame now rests. In the former department he published—*Discourse on the Phenician History of Sanchoniathon; Annales Thucydidei et Xenophontei; Chronologia Græco-Romana pro Hypothesibus Dion. Halicarnassei; Annales Velleiani, Quintiliani, Statiani;* and a larger treatise entitled *De Veteribus Græcorum Romanorumque Cyclis, obiterque de Cyclo Judæorum ac Ætate Christi, Dissertationes.* All of these obtained considerable reputation, and were frequently reprinted. In the latter department his works are more numerous and fragmentary. In his earlier writings he was regarded as one of the greatest champions of the non-jurors; but the absurd doctrine which he afterwards promulgated, that immortality could be enjoyed only by those who had received baptism from the hands of one set of regularly ordained clergy, and was therefore a privilege from which Dissenters were hopelessly excluded, justly deprived him of the confidence even of his friends. Dodwell died at Shottesbrooke, 7th June 1711. His eldest son Henry is known as the author of a pamphlet entitled *Christianity not founded in Argument*, to which a reply was published by his brother William, who was besides engaged in a controversy with Dr Conyers Middleton on the subject of miracles.

DOFRINES, or Dorefeld. See Norway

DOG. See *Canis*, in index to Mammalia.

Dog-*Days*, that period of the year when Sirius (*The* Dog-star) rises and sets with the sun. The dog-days commence in the latter part of July, and terminate the beginning of September. See Canicula.

Dog-*Fish*. See index to Ichthyology.

Dog-*Star*, Sirius, a star of the first magnitude, whose rising and setting with the sun gives name to the Dog-days.

Dog-*Watches*, among seamen, half-watches of two hours each, from 4 to 6 and from 6 to 8 p.m.

DOGE, the title of the chief magistrate in the republics of Venice and Genoa. The word properly signifies *duke*, being formed from the Latin *dux;* as *dogate* and *dogado* are formed from *ducatus*, a duchy.

The dogate, or office and dignity of doge, was elective; the doge at Venice being elected for life, and at Genoa only for two years. He was addressed under the title of Serenity, which among the Venetians was accounted superior to that of Highness.

The doge was chief of the council, and the mouth-piece of the republic; yet the Venetians did not go into mourning at his death, because he was not their sovereign, but only their first minister. In effect, the doge of Venice was merely the phantom or shadow of the majesty of a prince, all the authority being reserved to the republic. He only lent his name to the senate; and the power was diffused throughout the whole body, though the answers were all made in his name. If he gave any answers on his own account, they required to be very cautiously expressed and in general terms, otherwise he was certain to meet with a reprimand.

Anciently the doges were sovereigns; but afterwards things were much altered; and latterly the prerogatives reserved to the quality of doge were, to give audience to ambassadors, but not to make any answer as from himself in matters of importance; to answer according to his own pleasure to the compliments made to the signory, such answers being of no consequence; and, as first magistrate, to preside at all the councils. The credentials with which the senate furnished its ministers in foreign courts were written in his name, but not signed by him; this being usually done by a secretary of state, who also sealed them with the arms of the republic. The ambassadors directed their despatches to the doge; and yet he durst not open them except in presence of the counsellors. The money was struck in the doge's name, but not with his stamp or arms. All the magistrates rose and saluted the doge when he came into council: the doge rose to none except foreign ambassadors. In short, he was a mere pageant of state, and, politically speaking, a nonentity.

The doge nominated to all the benefices in the church of St Mark; he was protector of the Monastery delle Virgine; and bestowed certain petty offices of ushers of the household, called commanders of the palace. His family was not under the jurisdiction of the master of the ceremonies; and his children might have staff officers, and gondoliers in livery.

At the same time his state was tempered with a variety of circumstances which rendered it exceedingly burdensome. He might not go beyond Venice without permis-

sion of the council; and if he did, he was liable to receive affronts, without being entitled to satisfaction; and should any disturbance occur in the place where he happened to be, it belonged not to him but to the podestà, as being invested with the public authority, to suppress it.

The children and brothers of the doge were excluded from all the chief offices of state. They could not receive any benefice from the court of Rome, but were allowed to accept of the cardinalate, as being no benefice, nor including any jurisdiction. The doge could not divest himself of his dignity at will; and after his death his conduct was examined by three inquisitors and five correctors, who sifted it with great severity. The office of doge ceased even to have a nominal existence when Venice, "sunk in its glory, decayed in its worth," yielded, almost without a struggle, to the ascendency of republican France.

DOGGER, a Dutch vessel navigated in the German Ocean, and chiefly employed in the herring fishery. It is equipped with two masts, namely, a mainmast and mizenmast, and somewhat resembles a ketch.

DOGGERBANK, an extensive sandbank in the North Sea, lying between the coasts of England and Holland. Its western extremity extends nearly to Scarborough in Yorkshire, and its eastern to within 20 leagues of the coast of Jutland. It is the seat of important fisheries, and in 1781 was the scene of an obstinate naval engagement between the English and Dutch.

DOGGERS, in the English alum works, a name given to a sort of stone found in the mines with the true alum-rock. They contain some alum, and in some places in such quantity that they are wrought to advantage.

DOGMA (δόγμα), a maxim, tenet, or settled opinion, particularly with regard to matters of faith and philosophy.

DOGMATICAL, pertaining to a dogma, or to a settled opinion. A dogmatist is one who asserts things positively; a magisterial teacher; and hence the philosophy of the dogmatists was opposed to that of the sceptics, who doubted everything.

DOGMATICS, in *Church History*, one of the three orders of theologians before the Reformation. They were so called from basing their systems or dogmas on the authority of Scripture and the judgment of the Fathers. Opposed to them were the *Mystics*, who rejected the Scripture, and framed their opinions according to the dictates of spiritual intuition; and the *Scholastics*, who paid an almost sacred deference to the Aristotelian philosophy. Dogmatics is also used as a contraction for *dogmatic theology*, or the systematic exhibition of the doctrines of revelation.

DOGMATISM, one of the three great schemes into which philosophy is divided in regard to the possibility of truth and the means of its attainment. The first scheme is that of *scepticism* or Pyrrhonism, which denies the possibility of truth altogether, and affirms that we are by the constitution of our being condemned to hopeless and helpless doubt. The second scheme is that of *mysticism*, which, admitting the deceptive nature of human reason, and the unsatisfactory character of all human inquiry, yet postulates the possibility of truth as attainable by a certain inspiration or intuition superior to reason. The third scheme, viz., that of *dogmatism*, asserts full confidence in the results of our intellectual faculties when duly exercised on objects within their grasp, and affirms the possibility of discovering truth by a proper attention to order, method, and the laws of our constitution.

DOGMATISTS, a sect of ancient physicians, of which Hippocrates was the first author. They are also called *logici*, or logicians, from their using the rules of logic in subjects of their profession. They laid down definitions and divisions; reduced diseases to certain genera, and these genera to species, furnishing remedies for them all; supposed principles, drew conclusions, and applied these to the particular diseases under consideration. In this sense the dogmatists were contradistinguished from empirics and methodists. They rejected all medicinal virtues which they thought not reducible to manifest qualities; but Galen long ago observed of them, that they must either deny plain matter of fact, or assign but poor causes and reasons for many effects which they pretended to explain.

DOIG, David, the most learned of Scottish schoolmasters in modern times, was born in 1719. His father, who was a small farmer in the county of Forfar, died when he was yet in his infancy; and his mother contracted a second marriage with a worthy man, who, though by no means in affluent circumstances, and soon burdened with children of his own, treated him with the tenderness of a parent. A constitutional defect in his sight prevented him from learning to read till he was twelve years of age, but his subsequent progress was uncommonly rapid. Having for the space of three years attended a parochial school, where he was instructed in writing, arithmetic, and Latin, he became a successful competitor for a *bursary*, or exhibition, in the university of St Andrews. Here he completed the usual course with great approbation; and having taken the degree of A.B. he enrolled himself as a student of divinity, but his scruples respecting some articles in the Confession of Faith prevented him from entering the church. What those articles were, we have not discovered; but it appears sufficiently evident that his scruples had no reference to the essential doctrines of Christianity. Reconciling himself to the more humble avocations of a parochial schoolmaster, he for a considerable number of years taught the schools of Monifieth in his native county, and of Kennoway and Falkland in the county of Fife. He was afterwards appointed master of the grammar-school of Stirling; and the duties of this office, as a late writer remarks, he discharged for forty years with the greatest ability, and with the respect and esteem of all who knew him.

His accomplishments, not only as a classical scholar, but as a man of general erudition, procured him no mean reputation long before he was known as an author. Of his extensive knowledge of languages, the earliest specimen which he imparted to the public is to be found in about twenty pages of annotations on the Gaberlunzie-man, inserted in an edition published by his learned friend and neighbour Mr Callander.[1] His contribution is introduced in the following terms: "For the following elucidations of the general principles laid down in the preface, and exemplified in the notes on the foregoing ballad, the public and I are indebted to a learned and worthy friend of the author, whose extensive erudition is only equalled by the modesty and candour conspicuous in his whole deportment. I am sure our learned readers will regret with me, that he has not pushed his researches further than he has done. But from the little he has here given us, the general principles of etymology I have endeavoured to establish will derive new force, and our readers new entertainment." Although his learning did not procure him any academical preferment, it at least procured him a due share of academical honours. On the same day he received a diploma of A.M. from St Andrews, and another of LL.D. from Glasgow.

After an interval of ten years, he published "Two Letters on the Savage State, addressed to the late Lord Kaims." Lond. 1792, 8vo. This work which consists of 157 crown pages, is dedicated to Dr Horne, bishop of Norwich, and is introduced by a preface written by the author's friend Dr

[1] Two ancient Scottish Poems, the Gaberlunzie-man, and Christ's Kirk on the Green; with notes and observations, by John Callander, Esq. of Craigforth. Edinb. 1782. 8vo.

Gleig, a learned Episcopalian clergyman of Stirling. The first letter, written in 1775, was sent to Lord Kames, who was passing his Christmas vacation at Blair-Drummond, and who was much struck with the learning and ability of his anonymous correspondent. Having without much difficulty detected the author, he invited him to dine with him next day, when they met and parted with mutual satisfaction, but with no abatement of the confidence of either party in the correctness of his own views as to the primitive condition of the human race. After a very copious and free discussion of the savage state, each of the disputants retained his own opinion; but they nevertheless laid the foundation of a cordial friendship, which continued uninterrupted during the lifetime of the judge, who survived till 1782. It was scarcely to be anticipated that his lordship should abandon the favourite paradox which pervades his *Sketches of the History of Man*; namely that the tribes of mankind were originally placed in the condition of savages, from which they were enabled to emerge by the slow and gradual operation of certain instinctive principles implanted in their nature. This was a paradox which he did not himself devise, but which had already been exhibited in a variety of shapes by Condillac, Rousseau, Hume, Smith, Monboddo, and other speculators. Some of these lovers of wisdom delight in representing the human species as very closely allied to what we venture to describe as the lower animals; and whether the remote ancestors of men were not downright monkeys, or at least ourang-outangs, they feel a very philosophical degree of hesitation in deciding.

Dr Doig was of opinion that "had all mankind, without exception, been once in a state of absolute savagism, they would not only have continued in that state, but would have sunk still lower and lower, till they had at last, in a manner, put off the character of humanity, and degraded themselves to the level of the beasts that perish." All the learning, religion, laws, arts, and sciences, and other improvements that have enlightened Europe, a great part of Asia, and the northern coast of Africa, were so many rays diverging from two points, on the banks of the Euphrates and the Nile. In proportion as nations receded from these two sources of humanity and civilization, in the same proportion were they more and more immersed in ignorance and barbarism. "I think it obvious, beyond all possibility of contradiction," he adds, "that all those nations and societies of men which were removed to a considerable distance from the grand sources of civilization above mentioned, had early degenerated into a state of savagism, that this degeneracy increased exactly in proportion to their distance from those two points; that none of those nations who are known to have sunk into that state ever became civilized till they had renewed their correspondence with nations, or individuals, who had derived light and knowledge from the oriental sources;[1] that previous to the opening of this correspondence, no one people discovered the least propension or tendency towards culture and civilization; that, consequently, had all mankind been, at any one period, absolute savages, they would have continued in that unhappy state as long as the world existed; that if this train of reasoning should happen to be just, there must always have existed, in some part of the globe, a select society, a civilized race of men, among whom the knowledge of arts and sciences was always preserved, and from whom the blessings of civilization, and a cultivated state of life, were, in process of time, propagated to all the other nations, which at this day enjoy these invaluable benefits." This reasoning, supported with much ingenuity and learning, directly leads to the conclusion, which he leaves the reader to draw for himself, that the scriptural account of the primeval history of the human race is much more consonant with the principles of sound philosophy than the account devised by the united wisdom of modern philosophers.

His next publication, which is of a very different description, bears the subsequent title: "Extracts from a Poem on the Prospect from Stirling Castle. I. The Vision. II. Carmore and Orma, a love Tale. III. The Garden. IV. The King's Knot. V. Three Hymns, Morning, Noon, and Evening." Stirling, 1796, 4to. The entire publication extends to 35 pages. As a specimen of his English versification, we transcribe a passage from the Vision, in which he introduces the shade of Wallace addressing King Robert the night before the battle of Bannockburn. The hero mentioned in the first verse is Sir John Graham.

Great was the hero's fall, when squadrons round,
Mow'd by his well-try'd falchion, strew'd the ground;
Thrice blest his envy'd fall, maturely dead,
Fresh laurels blooming round his sacred head!
While I by Faction's tumults rudely tost,
My country thrall'd, my patriot labours lost,
Betray'd, and basely sold, inglorious died,
The sport of perjur'd peers and tyrant pride.
Go, noble Bruce! fulfil thy happier fate,
On thee new glories smile, new triumphs wait:
To-morrow's sun, I see the fulgence rise,
Shall seal thy fame, and waft it to the skies;
To-morrow's sun shall blast yon barbarous host,
And chase the cloud that low'rs o'er Scotia's coast.
Dread not, great sire, their threats or boasted might,
Their skill in council or their fame in fight.
Now patriot blood, by impious Edward shed,
In flaming vengeance bursts o'er Edward's head:
Far round thy camp, array'd in blazing arms,
Thy Scotia's slaughtered heroes sound th' alarms;
On fiery steeds, unseen they watch the fray,
And spread terrific din, and pale dismay;
With dreams of conquer'd foes they fan the fire,
And bid ev'n dastard souls to fame aspire,
With shields of proof thy half-armed bands protect,
Each random lance, each wav'ring shaft direct,
Till, deeply sped, it reach the deadly wound,
And stretch some champion breathless on the ground,
Till heaps of carnage choak th' impurpled flood,
And all these fields are drench'd in hostile blood.
I see Caernarvon pale, aghast with fear,
Fly swift, great Douglas thundering in his rear:
Ill fare the faithless churl who shelter lends,
And homeward safe the trembling tyrant sends.

These are the only works which Dr Doig published in a separate form. For the reputation of authorship he appears to have felt no particular ambition; he was, however, an indefatigable student, and wrote many tracts which were never printed, which he probably had no intention of printing. He wrote an elaborate dissertation *On the Ancient Hellenes*, which appeared in the Transactions of the Royal Society of Edinburgh, vol. iii. He afterwards prosecuted the same subject, and transmitted his manuscript to one of the secretaries of the society; but on the decease of that gentleman, no vestige of it could be found among his papers. His contributions to the third edition of the present work, and particularly the article *Philology*, exhibit the most conspicuous monument of his erudition. In the articles *Mysteries* and *Mythology*, although they bear marks of the same hand, he has not taken so wide a range; but the article *Philology* is a long and elaborate treatise, distinguished by ingenuity as well as learning. "In addition," says Lord Woodhouselee, "to the most profound knowledge of the Greek and Latin languages, which he wrote with a classical purity, Dr Doig had successfully studied the Hebrew, Arabic, and other kin-

[1] Relative to the barbarism and civilization of Greece, the following passage occurs in the work of a very ancient philosopher: Πολλακις γαρ και γεγονε και ἐσται βαρβαρος ἡ Ἑλλας, οὐχ ὑπ' ἀνθρωπων μονον γινομενη μεταναστατος, ἀλλα και ὑπ' αὐτης της φυσεως οὐ μειζονος οὐδε μειονος αὐτης γινομενης, ἀλλα και νεωτερας ἀει, και προς ἡμας ἀρχην λαμβανουσης. (Ocellus Lucanus de Universi Natura, cap. iii. edit. Gale, 1688.)

Doig.

dred dialects, and was deeply versed in Oriental literature." Of this diversified knowledge he has fully availed himself in his treatise on Philology. That portion of the Encyclopædia Britannica which contains it was published in London during the same week with a tract on the Greek verb, written by Dr Vincent, afterwards dean of Westminster,[2] "who was so struck with the coincidence of Dr Doig's opinions on many points with his own, that he began an epistolary correspondence with the author; and these two eminent scholars went hand in hand in their researches, and in a free communication of their opinions, with a liberality of sentiment which did honour to both. Such likewise was the conduct of the learned Mr Bryant, who had entered into a correspondence with Dr Doig on the subject of ancient mythology."[3]

Dr Doig, who was married and left descendants, died 16th March 1800, at the mature age of eighty-one. The following epitaph, written by himself, has been engraved on a marble monument erected to his memory by the town of Stirling, where he was respected for his worth and admired for his learning:—

Edidici quædam, perlegi plura, notavi
  Paucula, cum domino mox peritura suo.
Lubrica Pieriæ tentarem præmia palmæ,
  Credulus, ingenio heu nimis alta meo.
Extincto famam ruituro crescere saxo
  Posse putem, vivo quæ mihi nulla fuit?

Of his Latin versification we subjoin a more considerable specimen, which relates to the erection of a monument to the memory of Buchanan.

En, Buchanane, pii, longo post tempore, cives
  Ingenio statuunt hæc monumenta tuo.
Scotia te natum, te Gallia jactat alumnum,
  Te canit Europe, quæ plaga cunque patet.
Nil opus est saxo, nil indice: læta sonabunt
  Carmine Levinium sæcula cuncta decus.
Seu decoras Latio divina poemata cultu,
  Seu recinis nugas, ludicra, festa, sales;
Grandia seu tragico devolvis verba cothurno,
  Seu reseras varii claustra viasque poli;
Æmula seu captas Patavî præconia linguæ,
  Fœdera dum patriæ, bella virosque refers,
Eloquio, gravitate, sono, vi, lumine, verbis,
  Æquiparas veteres, exsuperasque novos.
Quod Graii potuere simul, quod Romula virtus,
  Tu solus numeris, arte, lepore potes.
Sin aliqua titubas patriæ labefactus amore,
  Aut nimium vera pro pietate pius,
Ipsa notam lecti Libertas plorat alumni,
  Ipsa tegit lauri Calliopea comis.
Sæpe nitor veri spissis latet obrutus umbris,
  Nec semper Lynceus cuncta videnda videt.

Besides Latin and English poems, Dr Doig left an immense variety of works in manuscript. The following list includes his most considerable treatises:—*A Rational Demonstration of the Divinity and Incarnation of Christ*, 36 pp. fol.; *The History of the Passion*, 45 pp. 4to; *On Vicarious Punishments*, 19 pp. fol.; *Strictures on Dr Campbell's Translation of the Sermon on the Mount*, 15 pp. 4to; *An Analysis of the Epistle to the Romans*, 48 pp. fol.; *An Analysis of the Epistle to the Hebrews*, 60 pp. 4to; *A Dissertation on the Place where the Ark rested after the Deluge*, 30 pp. fol.; *An Essay on the Situation of Tarshish and Ophir*, 66 pp. 4to; *A Dissertation on the Origin of Idolatry*, 21 pp. 4to; *An Enquiry into the Origin of Statue-Worship*, 84 pp. fol.; *A Philological Dissertation on Chain and Remphan*, 135 pp. fol.; *A Philological Dissertation on the Gods of the Egyptians*, 344 pp. 4to; *The History of the Titans*, 146 pp. 4to; *On the Doctrine of Demons*, 199 pp. 4to; *Letters on Mr Bryant's Ancient Mythology*, 133 pp. fol.; *An Essay on the Origin of the Greeks*, 406 pp. fol.; *Elucidations of Grecian Antiquities*, 98 pp. 4to; *On the Origin of the Scots*, 33 pp. 4to; *On the Origin of Language*, 59 pp. fol.; *Letters to Lord Kames on Language*, 112 pp. fol.; *Strictures on Dr Smith's Considerations on the Formation of Language*, 33 pp. fol.; *Letters to Dr Vincent on the Formation of Greek Verbs*, 48 pp. fol.; *An Essay on the Utility of the Learned Languages*, 49 pp. 4to, *Figures of Rhetoric poetically described*, 16 pp. 4to.

Doit || Dolci.

DOIT, a small Dutch copper coin, in value half a farthing. It was also the name of the ancient Scottish pennypiece, of which 12 were equivalent to a penny sterling.

DOKKUM, a town of Holland, province of Friesland, 12 miles N.E. of Leeuwarden, and about a league from the North Sea, with which it communicates by means of the ship canal Dokkum-diep. It has salt-refineries, breweries, and building-docks; and some trade in cheese, butter, and cattle. Pop. 3800.

DOLABELLA, Publius Cornelius, one of Cæsar's generals and the son-in-law of Cicero, was born about B.C. 70. At the death of Cæsar he espoused the party of Brutus, but soon after went over to that of the Triumvirs. By them he was intrusted with the province of Syria and the command against the Parthians; and accordingly he proceeded to Asia Minor, where he abused his power for the purpose of extorting money and troops from the inhabitants. For this he was declared an enemy of his country; and Cassius, to whom the proconsulate of Syria had been handed over, declared war against him. After the fall of Laodicea, Dolabella in despair ordered one of his soldiers to kill him, B.C. 43.

DOLCI, Carlo, or Carlino, a painter of considerable celebrity, was born at Florence in 1616. He was a disciple of Jacopo Vignali; and when only eleven years of age he attempted a whole figure of St John, which received extraordinary approbation. He afterwards painted a portrait of his mother, and displayed a new and delicate style, which brought him into notice, and procured him extensive employment at Florence and in other parts of Italy. Dolci appears to have used his pencil chiefly in sacred subjects, and bestowed much labour on his pictures. In his manner of working he was remarkably slow; and it is said of him that his brain was affected by seeing Luca Giordano despatch more business in four or five hours than he could have executed in as many months. His works are consequently not numerous. He generally painted in a small size, although there are a few pictures by him as large as life. He died at Florence in 1686, leaving a daughter (Agnese), who also painted historical pieces, and arrived at some degree of excellence in copying the works of her father.

Carlo Dolci holds the same rank in the Florentine that Sassoferrato does in the Roman school. Without the possession of much genius or invention, both these artists produced pleasing and highly-finished pictures. The works of Dolci are easily distinguishable by the delicacy of the composition, and by an agreeable tint of colour, improved by judicious management of the chiaroscuro, which give his figures a surprising relief. "His pencil," says Pilkington, "was tender, his touch inexpressibly neat, and his colouring transparent; though he has often been censured for the excessive labour bestowed on his pictures, and also for giving his carnations more of the appearance of ivory than the look of flesh." All his best productions are of a devout description, and most frequently represent the patient suffering of Christ, or the sorrows of the Mater Dolorosa. In these the heads are marked with calm intellectual beauty and pathetic emotion, and are peculiarly expressive of pure and tranquil devotion. They are full of sensibility, and yet all unstained by earthly passion. There is, we allow, a want of character and deep shadowing in his pictures, but the colouring and general tone accord with the idea of the passion portrayed; nothing is turgid or bold, harsh, or obtrusive; all is modesty, repose, and placid harmony. The best works of this master are the "St Sebastian;" the "Four Evangelists," at Florence; "Christ Breaking the Bread," in the Marquis of

[1] On this subject Dr Vincent published two different tracts. The Origination of the Greek Verb; an Hypothesis; Lond. 1794, 8vo. The Greek Verb analysed; an Hypothesis, in which the Source and Structure of the Greek Language in general is considered; Lond. 1795, 8vo.

[2] Woodhouselee's Memoirs of Lord Kames, vol. ii., p. 142.

Exeter's collection at Burleigh; and several smaller pictures, which are highly valued, and occupy honourable places in the richest galleries. (A. H.)

DOLE, a town of France, capital of a cognominal arrondissement in the department of Jura; situated on the declivity of a hill, on the right bank of the Doubs, and on the canal between the Rhone and Rhine; 28 miles N. of Lons-le-Saunier. Pop. (1851) 9913. It is the seat of a tribunal of primary instance, and has a Jesuit college, agricultural society, school of design, and a public library of about 6000 volumes. It is pleasantly situated and well built. The principal public buildings are the Hall of Justice; the Church of Nôtre Dame, a Gothic edifice; the Hôtel-Dieu; the new prison; barracks; two hospitals; and the ancient tower of Vergy, now used as a prison. Part of the Roman road leading from Lyons to the Rhine, and remains of a Roman aqueduct and theatre, are to be found here. Among its manufactures are straw hats, hosiery, leather, chemicals, and agricultural implements; and its trade in agricultural produce, wood, iron, marble, &c., is considerable. Dôle is a place of great antiquity, and was at one time the capital of the Franche-Comté and the seat of a parliament and university. In 1479 it was taken by Louis XI., when the greater part of the town was destroyed, and many of its inhabitants were put to the sword. It subsequently came into the hands of the Spaniards, and was fortified by Charles V. in 1530. In 1636 it was ineffectually besieged by the Prince of Condé. In 1668 it was taken by the French; and again in 1674, when its fortifications were destroyed.

DOLE, in the Saxon and British tongue, signified a part or portion; most commonly of a meadow where several persons had shares, and called dole-meadow. It also still signifies a distribution or dealing of alms, or a gift made by a great man to the people.

DOLE, in *Scotch Law* (Lat. *dolus*), is used for malevolent intention. It is an essential ingredient to constitute a crime; and hence the rule, *Crimen dolo contrahitur*.

DOLGELLEY, a market-town of North Wales, Merionethshire; situated on the Wnion, in a wide and fertile valley at the foot of the majestic mountain Cader Idris, 18 miles S.W. of Bala. The town is very irregularly built, and many of the older buildings are mean and unsightly; but these are gradually giving place to modern erections of a superior class. The Wnion is here crossed by a neat stone bridge of seven arches, erected in 1638; and a small stream, the Aran, descending from the Cader Idris, flows through the town. The church is a spacious edifice, standing on an eminence in the centre of the town, but with no pretensions to architectural beauty. It has a large tower, and contains some handsome monuments. The other principal buildings are the county hall, county gaol, old parliament house, and national school. Market-days—Tuesday and Saturday. Its manufactures are chiefly coarse woollen cloths and flannels. Pop. (1851) 2041.

DOLLAR, a village of Scotland, county of Clackmannan, 11 miles N.E. of Stirling; only worthy of notice for its academy, endowed by a Mr M'Nab, a native of the place, who left nearly L.80,000 for that purpose. The academy is an elegant Grecian structure, founded in 1819.

DOLLAR (Ger. *thaler*), the name of a silver coin of Spain and of the United States; worth 100 cents, or about 4s. 2d. sterling. The dollar appears to have been originally a German coin; and in various parts of Germany there are coins of different values so called. See MONEY.

DOLLOND, JOHN, a practical and theoretical optician of the highest celebrity; the discoverer of the laws of the dispersion of light, and inventor of the achromatic telescope; descended from a family of French refugees, was born in London on the 10th June 1706.

His first destination was the manufactory which afforded employment to the greater part of the French colony established in Spittalfields, and he passed some of his earlier years in the mechanical labour of a silk-weaver. He was, however, always attached to the mathematics and to natural philosophy, and he even extended his studies to the outlines of anatomy and of scholastic divinity; and in the pursuit of these objects he found himself obliged to acquire a competent knowledge of the Latin and Greek languages, a task which was much facilitated to him by the possession of a memory no less retentive than his observation was accurate and his reasoning correct. He married early, and he continued in his first occupation till he had established his eldest son, Peter Dollond, who inherited his own tastes as an optical instrument maker; and the success of the undertaking was such as to induce him, in 1752, to leave his own business, and to enter into partnership with his son in Vine Court.

These arrangements having taken place, it was not long before Mr Dollond communicated to the Royal Society some of the results of the application of his inventive powers to his new pursuits; and Mr Short, who then enjoyed the highest reputation as an optician, paid him the compliment of bringing them forward to the Society under the auspices of his name.

1. *A Letter to Mr James Short, F. R. S. concerning an Improvement of Refracting Telescopes. Phil. Trans.* 1753, p. 103. The author here describes a telescope with six glasses, as calculated for correcting, either wholly or in great measure, the errors of refraction arising from the dispersion of the different colours, as well as from the spherical form of the surfaces of the eye-glasses; appealing to the superiority of the telescopes which he had thus constructed, to those which had before been in use; but he reserves a more ample detail of the theory for a future occasion, which, however, does not appear to have presented itself, the improvement having been superseded by others incomparably more important.

2. *A Letter to James Short, A. M. F. R. S. concerning a Mistake in Mr Euler's Theorem for correcting the Aberration in the Object Glasses of Refracting Telescopes;* read 23d November 1752; together with an introductory letter of Mr Short, in which Euler's calculations are somewhat too categorically condemned, and with Euler's answers to Short and Dollond. *Phil. Trans.* 1753, p. 287. It is remarkable with what profound respect the experiments of Newton are treated in Mr Dollond's letter: "It is somewhat strange," he says, "that any body now-a-days should attempt to do that which so long ago has been demonstrated impossible." But although the investigation of truth was perhaps in this instance retarded, yet its ultimate discovery was not prevented by a just deference to a high authority. Euler was, however, certainly right in considering the law which he had assumed as sufficiently compatible with the results of Newton's experiments; although he was much mistaken in his conjectures respecting the achromatic properties of the eye.

3. *A Description of a Contrivance for Measuring Small Angles. Phil. Trans.* 1753, p. 178. This apparatus consists of a divided object-glass, with a scale for determining the distance of the images, by measuring the linear displacement of the two portions of the glass, which subtends the same angle from the focus of parallel rays, as the actual distance of the images does from the object-glass. The apparatus is recommended as particularly calculated to be applied to a reflecting telescope, and was afterwards adapted by Mr Peter Dollond to the improved achromatic telescopes. Mr Savery and Mr Bouguer had before used two separate lenses in a manner nearly similar; but the employment of a single glass divided affords a much more convenient arrangement.

Dollond.

4. *An Explanation of an Instrument for Measuring Small Angles. Phil. Trans.* 1754, p. 551. This paper contains a more detailed theory of the divided object-glass micrometer, and a testimony of its utility from Mr Short, founded on actual experiments.

5. *An Account of some Experiments concerning the Different Refrangibility of Light. Phil. Trans.* 1758, p. 733. We have here the important results of a series of accurate experiments, by which the author had undertaken to investigate the foundations of the Newtonian theory of refraction; though he began them without any hope of a success so brilliant as that which ultimately crowned his labours.

It was in the beginning of 1757 that Mr Dollond made the decisive experiment of putting a common prism of glass into a prismatic vessel of water, and varying the angle of the vessel till the mean refraction of the glass was compensated; when he found that the colours were by no means destroyed, as they were supposed to have been in a similar experiment related by Newton; for the remaining dispersion was nearly as great as that of a prism of glass of half the refracting angle. Mr Dollond then employed a thinner wedge of glass, and found that the image was colourless when the refraction of the water was about one fourth greater than that of the glass. He next attempted to make compound object-glasses by inclosing water between two lenses; but in this arrangement he found great inconvenience from the spherical aberration; so that he was obliged to try the effects of different kinds of glass, and he fortunately discovered that the refractions of flint and crown glass were extremely convenient for his purpose, the image afforded by them being colourless when the angles were to each other nearly as two to three; and hence he inferred that a convex lens of crown glass and a convex one of flint would produce a colourless image when their focal distances were in the same proportion. The spherical aberration, where the curvature was so considerable, still produced some inconvenience; but having four surfaces capable of variation, he was enabled to make the aberrations of the two lenses equal; and since they were in opposite directions, they thus corrected each other. All these arrangements required great accuracy of execution for their complete success; but, in the hands of the inventor, they produced the most admirable instruments, and he was singularly fortunate in obtaining a quantity of glass of more uniform density than had been ever manufactured on so large a scale. He afterwards made some small Galilean telescopes with triple object-glasses, and Mr Peter Dollond applied this construction to the longer telescopes with compound eye-pieces, the alteration rendering the spherical aberration still more manageable.

The merits of Mr Dollond's inventions were promptly acknowledged on the part of the Royal Society by the adjudication of the Copleyan medal for the year. In 1761, he was appointed optician to the king, and was elected a fellow of the Royal Society; a distinction which is often obtained on easy terms by those whose situation in life exempts them from the suspicion of seeking it for any purpose degrading to science, but which is generally an object of considerable ambition to persons of mechanical or commercial occupations.

A considerable share of the credit due to Mr Dollond's discoveries has been very erroneously attributed by some late historians and biographers on the Continent to Leonard Euler, a mathematician who most assuredly has little need of the appropriation of the merits of others to establish his claim to immortality. But in fact the only idea of Euler that could be said to have furnished any hint to Mr Dollond, has been shown by the calculations of Dr Maskelyne, and by the experiments of Dr Thomas Young and Dr Wollaston, to have been completely erroneous; nor did Euler even admit the accuracy of Mr Dollond's conclusions after his discovery was made, without considerable hesitation and scepticism. Mr Klingenstierna had simply expressed a doubt with respect to the result of Newton's experiments, though he by no means suspected the extent of the error. Mr Peter Dollond has sufficiently vindicated his father's claim to complete originality, in a paper read to the Royal Society in the year 1789; he has also suggested an explanation of the origin of Newton's mistake, by stating that there exists a kind of Venetian glass, of which the dispersive power little exceeds that of water, whilst its specific gravity nearly approaches to 2·58, which is assigned by Newton to glass in general; and it certainly seems more probable that some such circumstance as this was the cause of the error, than that Newton should, as some have suspected, have mixed acetate of lead with the water which he used, for an experiment which was so much more likely to be satisfactory without it.

Dolomieu.

Mr Dollond's appearance was somewhat stern, and his language was impressive, but his manners were cheerful and affable. He was in the habit of attending regularly, along with his family, the service of the French Protestant church. He constantly sought his chief amusement in objects connected with the study of those sciences which he had so much contributed to improve. Perhaps, indeed, he pursued them with an application somewhat too intense; for on the 30th of November, as he was reading a new work of Clairaut on the theory of the moon, which had occupied his whole attention for several hours, he had an attack of apoplexy, which shortly became fatal. He left two sons and three daughters. His sons succeeded to his business; and the younger dying a few years afterwards, his place was filled by a nephew, who assumed the family name, and who long conducted the establishment with undiminished respectability and success. (Kelly's *Life of John Dollond, with an Appendix of all the Papers referred to*, 3d edit, 4to, Lond. 1808.) (T. Y.)

DOLOMIEU, Deodatus Guy Silvanus Tancred de Gratet de, a distinguished mineralogist and geologist, son of Francis de Gratet de Dolomieu, and Frances de Berenger, was born on the 24th of June 1750, in the province of Dauphiné.

He was admitted a member of the order of Malta during his earliest infancy, as if he had been devoted from his cradle to glory and to misfortune. At eighteen he embarked in one of the galleys belonging to the order, and soon afterwards unhappily found himself under the necessity of fighting a duel, in which his adversary fell. The laws condemned him to die, but he received a pardon from the grand master; it was, however, necessary that it should be approved by the pope, who for a long time refused to confirm it, notwithstanding the solicitations of several European powers in behalf of the offender, until his consent was at last obtained by the Cardinal Torregiani. Dolomieu, in the mean time, was closely imprisoned in the island for nine months, and this period of solitude seems to have contributed materially to increase the seriousness of his character, and to confirm him in a contemplative turn of mind.

At the age of twenty-two he went to Metz as an officer in the regiment of carabineers, in which he had held a commission for seven years; and he displayed great courage and personal activity on occasion of an accidental conflagration which occurred soon afterwards. His leisure hours were employed in the study of chemistry and natural history, with the assistance of M. Thirion, an apothecary residing in that city. About the same time he also

Dolomieu. became intimate with De la Rochefoucault, with whom he maintained an unshaken friendship ever after.

1. He commenced his literary career with an *Italian translation of Bergman's Work on Volcanic Substances*, to which he added some *Notes*, and some observations on the *classification* of those substances.

2. He also furnished some *Notes* to a translation of Cronstedt's Mineralogy.

3. In 1775 he published *Researches on the Weight of Bodies at different distances from the Earth's Centre;* and upon the recommendation of La Rochefoucault, was made a correspondent of the Academy of Sciences at Paris. This compliment seems to have contributed to his determination to relinquish his prospects of success in the army, and to devote himself exclusively to science. Having resigned his commission, he commenced his geological labours with a tour in Sicily, Italy, and Switzerland.

4. This expedition afforded him the materials for his *Voyage aux Iles de Lipari, fait en* 1781, which he published in 1783, with some other tracts. He describes a singular kind of volcano at Macaluba, in Sicily, formed by air bubbling up from the crater, and causing its contents to overflow. The *Essay on the Climate of Malta* is rendered inconclusive by the imperfection of the eudiometrical apparatus that was then commonly employed.

5. He spent a part of the same year in examining the effects of the earthquake in Calabria, which are described in his *Mémoire sur les tremblemens de Terre de la Calabrie*, 8vo, Rome, 1784. Among other observations, he notices the singular fact, that all those parts of Calabria to which the earthquake extended are of a calcareous nature, without any traces of volcanic substances.

6. He published, in the *Journal de Physique*, vol. xxv. p. 191, a paper *on the extinct volcanoes* of the Val di Noto in Sicily.

7. His *Mémoire sur les Iles Ponces*, 1788, contains also a catalogue of the productions of Mount Etna, and an account of the eruption of 1787.

At the beginning of the revolution Dolomieu embarked, together with his friend La Rochefoucault, in that which appeared to be the cause of liberty. He was in Paris on the 14th of July, but he did not accept of any office under the newly-modified government. La Rochefoucault soon fell a victim to the horrors of the times. Dolomieu was present in his last moments, and received the affectionate messages which he sent to his mother and his wife, who were more distant witnesses of the dreadful scene.

8. No longer hoping for any benefit to his country from the political events of the day, he appears to have resumed his geological studies in other parts of Europe. In a *Letter on the Origin of Basalt*, dated Rome, 1790, *Journ. Phys.* vol. xxxvii. p. 193, he considers some stones of this description, for instance, the black trapps of Saxony, as the productions of water; and others, particularly the varieties found in the south of Europe, as of volcanic origin.

9. He writes, in 1791, a *Letter from Malta*, describing a species of limestone found in the Tyrol, hard enough to become phosphorescent upon collision, and not effervescing with acids until powdered. It was afterwards called the Dolomite. *Journ. Phys.* vol. xxxix. p. 3.

10. In a paper of *Directions for Naturalists*, he gives some useful advice to the circumnavigators about to sail to the South Seas. *Journ. Phys.* vol. xxxix. p. 310.

11. A series of his essays *On Compound Stones and Rocks* appeared from time to time in the *Journal de Physique*, vol. xxxix. p. 374; vol. xl. p. 41, 203, 372. In these he insists on the necessity of supposing that the ocean must have acted with great violence in reducing the continents into their present state; neither the slow subsidence of a general deluge, nor the continued action of ordinary rivers, being sufficient to explain the phenomena; and he remarks, that a violent agitation, such as must necessarily be supposed to have taken place, would naturally cause several alternations in the state of the waters, like immense waves or tides, which must have contributed to the modifications impressed on the earth's form. Indeed, the facts which support this opinion appear to be so obvious and so numerous, that it is difficult to understand how the opposite hypothesis should ever have become popular.

12. In the same volume there is a short paper *On Petroleum found in Rock Crystal*, and on some elastic fluids obtained from it, p. 318.

13. The progress of his memoirs was now interrupted by the proscription, in which many of the best and wisest of his countrymen were indiscriminately involved. "His duty and his inclination," he says, in a *Note* without a date, "required the devotion of his time and his arm to the defence of his king;" and he was obliged to submit to a temporary dereliction of his pursuits of science. P. 481.

14. But the cause was hopeless, and it was impossible for him to render it any essential service. He soon resumed his pen, and took occasion to express, with great spirit and energy, his political feelings, in his *Memoir on the Physical Constitution of Egypt. Journ. Phys.* vol. xlii. p. 41, 108, 194. In Egypt, he observes, there are many calcareous rocks and sands, which cannot have been brought down by the Nile; but there is also much of the soil which has the appearance of having been derived from the mud, with an admixture of sand only. The same cause, he thinks, may possibly have raised the bed of the river, so that the relative height of the inundations may have been little altered. He conceives that the Delta has increased even in modern times, though far less rapidly than it appears to have done formerly; for he is disposed to admit the credibility of the Homeric account of the distance of the Pharos from the continent, although he attempts to explain a part of the supposed change by the filling up of the lake Mareotis only; and, on the whole, he imagines that about a thousand square leagues of the surface of Egypt have been gained from the sea. He has not, however, thought it necessary to discuss the arguments which Bruce and others have brought against the established opinion, and against the facts asserted by Herodotus in its support; although some of the best informed of modern travellers have allowed the accuracy of Bruce's statements relating to this subject.

15. In a short paper *On the Figured Stones of Florence*, M. Dolomieu attributes the appearance of the arborescent and architectural figures which characterize them, to the process of slow decomposition and oxidation, gradually producing the stains in the extremely minute fissures, which favour these changes. *Journ. Phys.* vol. xliii. p. 285.

16. Upon the establishment of the school of Mines, in 1795, he accepted the situations of professor of geology and inspector of mines. He was also made one of the original members of the National Institute of Sciences and Arts, then organized by a law of the existing government. From this time he appears to have redoubled the energy with which he had before laboured in the pursuit of natural knowledge, and he published a great number of memoirs in the course of a very few years. One of the first of these consisted of *Observations on a pretended Coal Mine, called the Désirée. Journal des Mines*, year iii. N. ix. p. 45.

17. His *Methodical Distribution of Volcanic Substances* appeared in the new *Journal de Physique*, vol. (i.) xliii. p. 102, 175, 241, 406; vol. (ii.) xliv. p. 81. Of the five classes which he had before proposed in his notes on Bergman, the first comprehends substances actually pro-

duced by volcanoes; the second, substances thrown out by them unaltered; the third, bodies altered by the volcanic vapours; the fourth, bodies altered in the moist way; and the last, substances illustrative of the history of volcanoes only. The subsequent papers are partly continuations of the *Memoirs on Compound Rocks;* and they also relate particularly to the nature of lavas, some of which are shown to be formed from argillaceo-ferruginous stones. The heat of lavas has been pretty accurately entertained, in some cases, by the fusion of silver coins exposed to it, whilst those of copper remained entire; there is, however, an account of a stream of lava over which some nuns are stated to have walked while it was yet fluid; and this circumstance M. Dolomieu attributes to a mixture of sulphur, which remained melted at a temperature comparatively low. Some objections to this opinion have, however, been advanced by Mr Sage. *Journ. Phys.* vol. xlv. p. 281. *An Explanation of the New Method adopted in the Description of Minerals* was also published in the *Magazin Encyclopédique,* vol. i. p. 35.

18. Among the shorter essays of M. Dolomieu, we find a *Description of the Beryl. Journ. des Mines,* year iv. Ventose, p. 11.—19. *Description of the Mine of Manganese at Romanèche.* Germinal, p. 27.—20. *Letter on the Heat of Lavas.* Messidor, p. 53.—21. *On Quartzose Concretions,* p. 56. —22. *On Ancient Lithology. Mag. Enc.* i. p. 437.—23. *Description of the Emerald,* ii. p. 17, 145.—24. *A Letter from Berlin on the Magnetic Serpentine,* ii. vol. vi. p. 7.—25. *On the Leucite, or White Garnet. Journ. des Mines,* year v. p. 177.—26. *On the Necessity of Chemical Knowledge to a Mineralogist, and on the term Chrysolith,* p. 365.

27. *An Introductory Discourse on the Study of Geology* appears in the *Journal de Physique,* vol. xlv. p. 256. It was preliminary to a course of lectures on the natural position of minerals, and it contains good and detailed directions for the use of students, with some eloquent advice on the benefits of travelling, and on the merits of temperance and simplicity of manners.

28. In the next volume, p. 203, our author announces the *Discovery of the Crystallized Sulphate of Strontia in Sicily.* It had before been found uncrystallized in France.

29. *On Colour as a Characteristic of Stones. Journ. Phys.* vol. (iii.) xlvi. p. 302. This essay contains some objections to Werner's habit of relying too implicitly on colour, and the white tourmaline of St Gothard is adduced as an instance of the triumph of form over complexion; a just tribute of commendation is also paid to the merits of Haüy.

30. A paper *On the Pyroxene, or Volcanic Schörl,* is chiefly designed to support the opinion that such crystals have been formed previously to the existence of the volcano, by the observation of a specimen found adhering to a rock which had never undergone the effect of fire. *Journ. Phys.* vol. xlvi. p. 306.

31. *A Memoir read to the Institute* contains the report of M. Dolomieu's mineralogical tours, made in the years 1797 and 1798. *Journ. Phys.* vol. xlvi. p. 401. *Journ. des Mines,* year vi. p. 385. He visited the south of France, the Alps, and the neighbouring lakes and mountains, almost always on foot, and with his hammer in his hand, accompanied by Brochart, Cordier, Bonniers, and his brother-in-law the Marquis de Drée. From his observations in Auvergne, in particular, he concludes that the foundation or origin of the volcanoes there is certainly below the granite rocks, which therefore cannot, properly speaking, be called primitive; and he proceeds to a much bolder and less admissible conjecture, that the central parts of the globe are at present in a state approaching to fluidity, which he attempts to support by the ready transmission of the shocks of earthquakes to distant places; and he even quotes the authority of Lagrange as having been disposed to encourage the opinion. Volcanoes, in general, he divides into ancient and modern, as separated by the intervention of the changes which have reduced the continents to their present form. With respect to the heat of the lava, he observes, that it has not been sufficient to expel the carbonic acid from the limestone which has been exposed to it. He also remarks, that, where basalt in fusion has been suddenly cooled by water, the contraction has caused it to divide into columns, which are not crystalline, because their angles are irregular, and which are smaller and more uniform in proportion as the water is deeper. He contrasts the horizontal strata of France with the vertical tables of the Alps, and particularly describes the accretion of a mantle of calcareous substances, two miles in height, which has attached itself to the north-east faces of the Alps, subsequently to their first formation as mountains. From this expedition he brought home an immense collection of rocks and stones, principally valuable for their arrangement with a view to the illustration of his particular doctrines in geology, which, with the rest of his cabinet, have since formed a part of the superb museum of M. de Drée.

32. He published, about the same time, a paper *On the Mountains of the Vosges. Journ. des Mines,* year vi. p. 315.

33. *Extract of a Report on the Mines of the department of the Lozère,* p. 577.

34. The only communication of M. Dolomieu printed in the *Memoirs of the Institute,* is rather on a mechanical than a mineralogical subject, containing an *Account of the Art of Making Gun-Flints. M. Math.* vol. iii. p. 348. Nicholson's *Journal,* 8. vol. i. p. 88.

He was engaged, after his return from Switzerland, in some mineralogical contributions to the *Encyclopédie Méthodique,* when he was invited to take a part in the scientific arrangements of the expedition to Egypt. He did not, however, strictly confine himself to this department, but was successfully employed as a negociator for the surrender of Malta. In Egypt he visited the pyramids, and examined some of the mountains which form the limits of the country, but his health soon compelled him to return to Europe. In this voyage the vessel on board of which he had embarked was nearly overwhelmed by a tempest, and appears to have been only saved by the temporary expedient of throwing overboard pounded biscuit mixed with straw, which entered the leaks with the water, and afforded a partial remedy, which was repeated from time to time, until the vessel, at the last extremity, was driven into a port in the Gulf of Tarentum. The counter-revolution of Calabria had occurred but a few days before, and Dolomieu, with his companion Cordier, and many others of his countrymen, were thrown into prison, and they even owed their lives to the great exertions of an individual among the insurgents in their favour. They were afterwards removed to Sicily, but with the loss of their collections and their manuscripts; and Dolomieu being denounced, as a member of the order of Malta, for high treason, was separated from his countrymen, and closely confined in a dungeon. Solicitations were addressed to the king of Naples on his behalf, by the National Institute, by the French government, by the king of Spain, and in the name of the Royal Society of London, although its illustrious president was certainly not "at the time in Sicily," as the *Nouveau Dictionnaire Historique* affirms; but the captive derived essential assistance from the good offices of an English gentleman at Messina, and some Danes accommodated him in his pecuniary arrangements. Whilst still a prisoner, he was appointed successor to Daubenton, at the Museum of Natural History; and the very circumstance of his captivity seemed to give him an advantage

over his competitor. In the treaty made by the French with the king of Naples, after the battle of Marengo, it was expressly stipulated that Dolomieu should be set at liberty.

35. Upon his return to Paris he was made a member of the Conservative Senate, and he delivered soon afterwards a course of lectures on the philosophy of mineralogy. He had written part of an essay on this subject during his imprisonment in Sicily, with a bone for a pen, and a mixture of soot and water instead of ink, on the margins of such books as were allowed him; and his last publication was *Sur la Philosophie Minéralogique, et sur l'espèce Minéralogique*. Paris, 1801. His classification depended on considering the species as determined by the integrant molecule, and on arranging the different external forms as varieties, whether regular as modifications, or irregular as imperfections; besides the variations of colour and appearance, and the more essential affections of the consistence of the substance, which may be called contamination; but the whole essay may be considered as rather of a logical than of a physical nature.

After the delivery of his lectures, he set out upon a new expedition to his favourite mountains, in company with Mr Neergard and Mr d'Eymar, who published an account of the journey. Paris, 1802. He meditated a tour into Germany and to the north of Europe; but his return to Paris was interrupted by indisposition, when he had arrived, by way of Lyons, at Chateauneuf, where he met his sister and his brother-in-law, and this journey was his last.

The merits of Dolomieu consisted as much in his personal character as in his scientific attainments. His conversation was modest, though his courage was heroic; his manners were simple though refined; and though his talents were considerable, they seem to have been surpassed by his industry. It has been remarked, that he often undertook more than he had any reasonable prospect of completing; but, in the mean time, he was perhaps as happy in the pursuit as he would have been in the attainment of his object. He died, universally regretted, at Drée, near Maçon, on the 27th of November 1801, in the midst of his affectionate family, who had been the partakers in his pursuits, and the consolation of his misfortunes.

Lacépède, *Notice Historique sur la Vie et les Ouvrages de Dolomieu; Mém. Math. Inst.* vol. vii. 1806, p. 117; Chalmers's *Biographical Dictionary*, vol. xi. 8vo, London, 1818. (T. Y.)

DOLPHIN. See index to ICHTHYOLOGY.

DOLPHIN, in nautical language, a rope or strap fastened round the mast of a ship to give support to the *puddening* (a mass of yarn or oakum used to prevent chafing), where the lower yards rest on the slings. *Dolphin* is also applied to a spar or buoy furnished with a large ring, and anchored, to which a vessel may bend its cable.

DOM, or DON, a title of honour, invented, and chiefly used, the former by the Portuguese, the latter by the Spaniards. It is an abbreviation of *dominus*, and signifies *sir* or *lord*.

This title, it seems, was first given to Pelayo, in the beginning of the eighth century. In Portugal no person can assume the title of *Dom* without the permission of the king, since it is looked upon as a mark of honour and nobility. In France it is sometimes used among the religious. The old English form of the word is *dan*, so frequently used by Chaucer.

DOM AND SOM, in old charters, signifies full property and jurisdiction.

DOMAT, or DAUMAT, JEAN, a celebrated French jurisconsult, born at Clermont in Auvergne, in 1625. He is principally known from his elaborate legal digest, in four volumes 4to, under the title of *Lois Civiles dans leur Ordre Naturel*; an undertaking for which Louis XIV. settled on him a pension of two thousand livres. Domat was intimate with Pascal, and at the death of that celebrated philosopher was intrusted with his private papers. Besides the *Lois Civiles*, Domat made in Latin a selection of the most common laws in the collections of Justinian. This work, however, did not appear until after his death, when it was published separately under the title of *Legum Delectus*, and was subsequently appended to the *Lois Civiles*. It has been translated into English. Domat died in 1696.

DOME. See index to ARCHITECTURE, and ARCH.

DOME, or DOOM, judgment, sentence, or decree. The homagers' oath in the black book of Hereford ends thus: "So help me God at his holy dome, and by my trowthe."

DOMENICHINO, or DOMENICO, ZAMPIERI, the celebrated painter, was born at Bologna in 1581. He was placed, when young, under the tuition of Denis Calvart; but having been treated with great severity by that master, he left him, and became a pupil in the academy of the Caracci, where he remained for a long time. The genius of Domenichino was slow in its development. He was at first timid and distrustful of his powers; whilst his studious, thoughtful, and reserved manners were misunderstood by his companions for dulness. But the intelligent Annibale Caracci, who observed his faculties with more attention, and knew his abilities better, predicted that the apparent slowness of Domenichino's genius would in time produce what would be an honour to the art of painting. When his early productions had brought him into notice, he studied with incredible application, and made such advances in painting as to raise his works into a comparison with those of the most admired masters. From his acting as a continual censor of his own works, he became amongst his fellow pupils the most accurate and expressive designer; his colours were the truest to nature, and of the best *impasto*, and he proved the most universal master in the theory of his art; in short, the only painter, amongst them all, in whom Mengs found nothing to desire, except a somewhat larger proportion of elegance. That he might devote his whole being to the art, Domenichino shunned all society; or if he occasionally sought it in the public theatres and walks, it was in order better to observe the play of the passions in the features of the people—those of joy, anger, grief, terror, and every affection of the mind, and to commit them vividly to his tablets; and thus, says Belloni, it was that he succeeded in delineating the soul, in colouring life, and calling forth heartfelt emotions, at which all his works aim, as if he waved the same wand which had belonged to the poetical enchanters Tasso and Ariosto.

After several years' severe study at Bologna, Domenichino went to Parma, in order to examine the beautiful works of the Lombards; and thence proceeded to Rome, where he assisted Annibale Caracci, and obtained employment through his recommendation from Cardinals Borghese, Farnese, and Aldobrandi, for all of whom he painted works in fresco, which were justly admired. The distinguished reputation which he had acquired excited the jealousy of some of his contemporaries, who represented his very excellences as defects. Lanfranco in particular, one of his most inveterate enemies, asserted that his communion of St Jerome was an imitation from Agostino Caracci, and procured an engraving of this master's picture of the same subject, copies of which were circulated for the purpose of showing up Domenichino as a plagiarist. But this stratagem only tended to expose the calumnious intents of his rivals, as it was evident that there was no other resemblance in the compositions than what must necessarily be the case in the pictures of two artists treating the same subject; and that every essential part, and all that was admired in the work, were entirely his own. If it had been possible for the exertions of modest merit to have repelled the shafts of

Domesday. slander, the pictures which he painted immediately afterwards, representing subjects from the life of St Cecilia, might have silenced the attacks of envy and malevolence; but they only increased the alarm of his competitors, and redoubled their injustice and malignity. Disgusted with these cabals, Domenichino left Rome for Bologna, where he remained until he was recalled by Pope Gregory XV., who appointed him principal painter and architect to the pontifical palace. But the persecutions of his enemies continued unabated, and are said to have absolutely wearied out his life. He died, not without suspicion of being poisoned, in 1641.

Domenichino, in correctness of design, expression of the passions, and simplicity and variety in the airs of his heads, is allowed to be little inferior to Raffaelle. "We must," says Lanzi, "despair to find paintings exhibiting richer or more varied ornaments, accessaries more beautifully adapted, or more majestic draperies. The figures are finely disposed both in place and action, conducing to the general effect; whilst a light pervades the whole, which seems to rejoice the spirit, growing brighter and brighter in the aspect of the best countenances, whence they first attract the eye and heart of the beholder." The persons delineated could not tell their tale to the ear more plainly than they speak it to the eye. The scourging of St Andrew, which he executed in competition with Guido at Rome, is a powerful illustration of this truthful expression. Of the two works of these masters, Annabale Caracci preferred that of Domenichino. It is said that in painting one of the executioners the artist actually threw himself into a passion, using threatening words and actions, and that Annibale Caracci surprising him at that moment, embraced him, exclaiming with joy, "To-day, my dear Domenichino, thou art teaching me." "So novel," remarks Lanzi, "and at the same time so natural, it appeared to him, that the artist, like the orator, should feel within himself all that he is representing to others." Domenichino is universally esteemed as the most distinguished disciple of the Caracci. Algarotti prefers him to the greatest masters; and Nicolo Poussin considered him as the first painter after Raffaelle. His pictures of the Communion of St Jerome, Adam and Eve, and the Martyrdom of St Agnes, are esteemed amongst his best works. Domenichino was unrivalled in his frescos. He excelled also in landscape painting. In that style the beauty arising from the natural and simple elegance of his scenery, his trees, his well-broken grounds, and, in particular, the character and expression of his figures, gained him as much public admiration as any of his other performances.

The worth of Domenichino, as Agucchi foretold, was never rightly appreciated during his lifetime. But the spirit of party which set in so strongly against him whilst living, soon passed away when he was no more; and impartial posterity has done justice to the talents of this illustrious painter, whose works are in the highest esteem, and fetch enormous prices. (A. H.)

DOMESDAY, or Doomsday Book, a very ancient record containing a survey of all the lands of England, made in the time of William the Conqueror. It consists of two volumes—a greater and a less. The first is a large folio, written on 382 double pages of vellum, in a small but plain character, each page having a double column. Some of the capital letters and principal passages are touched with red ink, and some have strokes of red ink run across them, as if scratched out. This volume contains the description of 31 counties. The other volume is in quarto, written upon 450 double pages of vellum, but in a single column, and in a large but very fair character. It contains the counties of Essex, Norfolk, Suffolk, part of the county of Rutland, included in that of Northampton, and part of Lancashire, in the counties of York and Chester.

This work, according to the red book in the exchequer, was begun by order of William the Conqueror, with the advice of his parliament, in the year 1080, and completed in the year 1086. The reason given for taking this survey, as assigned by several ancient records and historians, was, that every man should be satisfied with his own right, and not usurp with impunity what belonged to another. But besides this, it is stated by others, that all those who possessed landed estates now became vassals to the king, and paid him so much money by way of fee or homage, in proportion to the lands they held; a circumstance which appears very probable, as there was at that time extant a general survey of the whole kingdom, made by order of King Alfred.

For the execution of this survey recorded in Domesday-book, commissioners were sent into every county and shire, and juries summoned in each hundred, out of all orders of freemen, from barons down to the lowest farmers. These commissioners were to be informed by the inhabitants, upon oath, of the name of each manor and that of its owner, also by whom it was held in the time of Edward the Confessor; the number of hides; the quantity of wood, of pasture and of meadow land; how many ploughs were in the demesne, and how many in the tenanted part of it; how many mills and how many fish-ponds or fisheries belonged to it; the value of the whole in the time of King Edward, as well as when granted by King William, and at the time of this survey; and also whether it was capable of improvement or of being advanced in value. They were likewise directed to return the tenants of every degree, the quantity of lands then and formerly held by each of them, what was the number of villeins or slaves, and also the number and kinds of their cattle and live stock. These inquisitions, being first methodized in the county, were afterwards sent up to the king's exchequer.

This survey, at the time when it was made, gave great offence to the people, and occasioned a suspicion that it was intended for some new impost. But notwithstanding all the precaution taken by the Conqueror to have the survey faithfully and impartially executed, it appears that a false return was given in by some of the commissioners, probably, as is alleged, from a pious motive. This was particularly the case with the Abbey of Croyland in Lincolnshire, the possessions of which were greatly underrated, both with regard to quantity and value. Perhaps more of these "pious frauds" were discovered, as it is said that Ralph Flambard, minister to William Rufus, proposed making a fresh and more rigorous inquisition; but this was never carried into operation.

Notwithstanding the proof of its falsehood in some instances, which must throw a suspicion on all others, the authority of Domesday-book was never permitted to be called in question; and when it has been necessary to distinguish whether lands were held in ancient demesne or in any other manner, recourse was always had to Domesday-book, and to it only, in order to determine the doubt. From this definitive authority, from which, as from the sentence pronounced at domesday, or the day of judgment, there could be no appeal, the name of the book is said to have been derived. But Stowe assigns another reason for this appellation, namely, that Domesday-book is a corruption of "*domus Dei* book;" a title given it because heretofore it was deposited in the king's treasury in a place of the church of Westminster or Winchester called *domus Dei*. From the great care formerly taken to preserve this survey, we may learn the estimation in which it was held. In the dialogue de Sacrariis it is said, *Liber ille* (meaning Domesday-book) *sigilli regis comes est individuus in thesauro.* Until latterly it has been kept under three different locks and keys; one in custody of the treasurer, and the others in that of the two chamberlains of the exchequer. It is now deposited in the chapter-house at Westminster, where

it may be consulted, on paying to the proper officers a fee of six-and-eightpence for a search, and fourpence per line for the matter transcribed from it.

Besides the two volumes above mentioned, there is also a third made by order of the same king, and which differs from the others in form rather than in matter. There is likewise a fourth, which is kept in the exchequer, and which, though a very large volume, is only an abridgment of the others. In the remembrancer's office in the exchequer there is kept a fifth book, also called Domesday, which is the same with the fourth book already mentioned. King Alfred had a roll which he called Domesday; and the Domesday-book made by William the Conqueror referred to the time of Edward the Confessor, as that of King Alfred did to the time of Ethelred. As the fourth book of Domesday had many pictures and gilt letters in the beginning, relating to the time of King Edward the Confessor, this led some into an opinion altogether erroneous, namely, that Domesday-book was composed in the reign of King Edward.

DOMESTIC, one who lives in the family of another in some particular capacity, as that of chaplain, secretary, servant, &c.

DOMFRONT, a town of France, capital of a cognominal arrondissement in the department of Orne, on a steep eminence at the foot of which flows the Varenne, 35 miles W.N.W. of Alençon. This was formerly one of the strongest places in Normandy. It was several times taken and retaken by the French and English, and by the Protestants and Catholics. The church of Notre Dame is a fine old building, and contains the tomb of William, Count of Bellesme, the founder of the town. The chief manufactures are coarse linen and hempen cloths. Pop. (1851) 2773.

DOMIFYING, in *Astrology*, the dividing the heavens into twelve houses, in order to erect a theme or horoscope, by means of six great circles, called *circles of position.* There are various ways of domifying. That of Regiomontanus, which is the most common, makes the circles of position pass through the intersections of the meridian and the horizon; but others make them pass through the poles of the zodiac.

DOMINANT, in *Music.* See MUSIC, *passim*, §§ *Harmony*, *Chords.*

DOMINATION, or DOMINION, in *Theology*, the fourth order of angelic beings in the celestial hierarchy.

DOMINGO, ST. See HAYTI.

DOMINIC DE GUZMAN, founder of the Dominican order of monks, was born at Calahorra, the ancient Calagurris, in Old Castile, in 1170. He preached with great zeal against the Albigenses when Pope Innocent III. proclaimed a crusade against that unhappy people; and he was appointed inquisitor in Languedoc, where he founded his order, and had influence enough to get it confirmed by the Lateran council in 1215. He died at Bologna in 1221, in the fifty-first year of his age, and was afterwards canonized. The Dominican order has produced many illustrious men. See DOMINICANS.

DOMINICA, one of the Leeward group of islands in the West Indies, belonging to Britain, and lying between the French islands of Martinique and Guadaloupe, 24 miles N. of the former, and about the same distance S. of the latter. Dominica was so named by Columbus from his having discovered it on a Sunday (in 1493). It was ceded to England by the peace of Paris in 1763, but was taken by the French in 1778. At the peace of 1783 it was restored to England, in whose possession it has since remained. Dominica is 29 miles in length from N. to S., and 16 in breadth, and has an area of about 186,436 acres. The principal town, Roseau, situated on the S.W. side of the island, is in Lat. 15. 19. N., Long. 61. 28. W. The surface is generally rugged and mountainous, interspersed with fertile and well-watered valleys. The highest point is 5314 feet above the level of the sea. The origin of this island is volcanic, and sulphur and other volcanic products are abundant. The soil is light and well adapted for the growth of coffee. The hills are covered with valuable timber trees of the kinds commonly found in the West Indies. Game is abundant, and the fisheries on the coast are very productive. The principal productions are sugar, molasses, rum, coffee, cocoa, and oranges. The cultivation of cotton has lately been introduced to a small extent, and has been found to answer very well, particularly on land near the sea coast. The principal staple products exported in the years ending 5th January 1852 and 5th January 1853 were as follows:—

	1852.	1853.
Sugar	62,168 cwts.	65,788 cwts.
Rum	30,927 galls.	35,794 galls.
Molasses	95,600 „	81,016 „
Coffee	58,063 lbs.	67,594 lbs.
Cocoa	33,884 „	69,296 „
Lime juice	4,280 galls.	5,062 galls.
Arrow root	5,944 lbs.	3,525 lbs.
Oranges	1,019,800	1,354,020
Cotton Wool	2,000 lbs.	3,250 lbs.

The value of exports and imports, and the revenue for the years 1849, 1850, and 1851, were as follows:—

	1849.	1850.	1851.
Imports	L.50,616	L.57,656	L.71,828
Exports	48,070	58,265	62,527
Revenue	8,913	10,275	12,901

The population in 1844 was 22,200, of whom 11,604 were females. There are places of worship for Episcopalians, Methodists, and Roman Catholics. A board of education has recently been established. There are three free schools in Roseau, and seven in other parts of the island, having in all (1852) 1190 pupils. The principal harbours are Roseau and Prince Rupert's Bay.

DOMINICAL LETTER, popularly called *Sunday Letter*, one of the seven letters A B C D E F G, used in almanacks to denote the Sundays throughout the year. (See CALENDAR, vol. vi. pp. 80, 81.) The word is formed from *Dominica* or *Dominicus dies*, the Lord's day. The dominical letters were introduced into the calendar by the primitive Christians instead of the *nundinal* letters in the Roman calendar.

DOMINICAL, in *Ecclesiastical History.* The council of Auxerre, held in 578, decreed that women should communicate with their dominical. Some authors contend that this signified a linen cloth in which they received the species, not being allowed to receive them in the bare hand; while others suppose it was a kind of veil for the head. The most probable account is, that it was a linen cloth in which in times of persecution they received and preserved the eucharist, to be taken upon occasion at home. That this was the case appears by the practice of the first Christians, and by Tertullian's book *Ad Uxorem.*

DOMINICANS, an order of religious persons, called in some places *Jacobins*, and in others *Predicants* or *Preaching Friars.*

The Dominicans took their name from their founder Dominic de Guzman, a Spanish gentleman of Calahorra, in Old Castile. He was first canon and archdeacon of Ossuna; and afterwards, as above stated, preached with great zeal and vehemence against the Albigenses in Languedoc, where he laid the first foundation of his order. It was approved of in 1215 by Innocent III., and confirmed in 1216 by a bull of Honorius III. under the title of St Augustin. Dominic afterwards added several austere precepts and observances, obliging the brethren to take a vow of absolute poverty, to abandon entirely all their revenues and possessions, and to assume the title of *Preaching Friars*, because public instruction was the main object and end of their institution.

Their first convent was founded at Toulouse by the bishop of that place and Simon de Montfort. Two years afterwards another was established at Paris, near the bishop's house; and some time subsequently a third in the Rue St Jacques, whence the denomination of *Jacobins*.

Immediately before his death Dominic sent Gilbert de Fresney, with twelve of the brethren, into England, where, in 1221, they founded their first monastery at Oxford, and soon afterwards another at London. In 1276 the mayor and aldermen of the city of London gave them two whole streets by the river Thames, where they erected a very commodious convent, whence that place is still called Black Friars, from the name by which the Dominicans were called in England.

St Dominic at first only took the habit of the regular canons, that is, a black cassock and rochet; but this he quitted in 1219 for that which the order afterwards wore, and which, it is pretended, was shown by the blessed Virgin herself to the beatified Renaud d'Orleans.

This order gradually diffused itself throughout the whole known world. It had forty-five provinces under the general, who resided at Rome; and twelve particular congregations or reforms, governed by twelve vicars general.

This order has produced three popes, above sixty cardinals, several patriarchs, a hundred and fifty archbishops, and about eight hundred bishops; besides masters of the sacred palace, whose office has been constantly discharged by a religious person of this order ever since the time of St Dominic, who held it under Honorius III. in 1218.

Of all the monastic orders, none enjoyed a higher degree of power and authority than the Dominican friars. Their credit was great, and their influence universal. But the measures which they used in order to maintain and extend their authority were so perfidious and cruel, that towards the beginning of the sixteenth century their influence began to decline. The tragic fate of Jetzer, at Bern, in 1509, which occurred there during an uninteresting dispute between them and the Franciscans relating to the immaculate conception, must ever reflect indelible infamy on this order. An account of it will be found in Burnet's *Travels through France, Italy, Germany, and Switzerland* (p. 31), and also in Mosheim's *Ecclesiastical History* (vol. iii. p. 294, 8vo). They were indeed perpetually employed in stigmatizing with the opprobrious name of heretic numbers of learned and pious men; in encroaching upon the rights and property of others, in order to augment their possessions; and in laying the most iniquitous snares and stratagems for the destruction of their adversaries. They were also the principal counsellors by whose instigation and advice Leo X. determined on the public condemnation of Luther. The papal see never had more active and useful abettors than this order and that of the Jesuits. As Nominalists, Augustinians, and Thomists, the dogmas of the Dominicans were keenly pitted against those of the Franciscans.

DOMINIS, Marc Antonio de, celebrated as a theologian and natural philosopher, was born in the island of Arbe, in 1566. He was educated in the order of the Jesuits, and was raised from the bishopric of Segni to the archbishopric of Spalatro. His endeavours to reform the church soon after made him obnoxious to the papal authorities, and he was compelled to leave his native country. Having become acquainted with Bishop Bedell, whilst chaplain to Sir Henry Wotton, ambassador from James I. at Venice, he communicated to that prelate his books *De Republica Ecclesiastica*, which were afterwards published at London, with Bedell's corrections. He came to England with Bedell, where he was received with great respect, and preached and wrote against the Roman Catholic religion. In 1619 he published at London Father Paul's *History of the Council of Trent*, with a dedication to King James. But on the promotion of Pope Gregory XIV., who had been his schoolfellow and old acquaintance, he was deluded by Gondomar the Spanish ambassador into the hopes of procuring a cardinal's hat, and thus of proving an instrument of great reformation within the church. Accordingly he returned to Rome in 1622, recanted his errors, and was at first well received; but he afterwards wrote letters to England recanting his recantation, and these being intercepted, he was imprisoned by Pope Urban VIII. and died in 1625. He is believed to have been the first to promulgate a true theory of the rainbow.

DOMINIUM Directum, in *Feudal Law*, the right which a superior retains in his lands, notwithstanding the feudal grant to his vassal. The right which the vassal acquires in the lands by such grant is termed *dominium utile*.

DOMINO (Ital.), a long robe of black silk furnished with a hood removable at pleasure, and used as a disguise by persons of both sexes, chiefly at masquerades.

DOMINUS (Lat. *lord*, *master*), a title formerly prefixed to a name, usually to denote that the person was either a knight or a clergyman. The title was sometimes also given to a gentleman not dubbed, especially if he were lord of a manor. In Holland the title *dominus* is still used to distinguish a minister of the Reformed Church.

DOMITIAN, Roman emperor, reigned A.D. 81–96. See Roman History.

DOMREMY LA PUCELLE, a small village of France, department of Vosges, on the left bank of the Meuse, 7 miles north of Neufchateau. It is only remarkable as being the birthplace and original residence of the famous Joan of Arc. The house which she inhabited is still preserved; and opposite to it a handsome monument surmounted by a colossal bust of the heroine was erected in 1820.

DON, a title of honour. See Dom.

Don, a river of Scotland, Aberdeenshire, rising in Ben Aven, near the N.W. boundary of the county, and after a course of 62 miles falling into the German Ocean about a mile and a half north of Aberdeen. Not far from its mouth it is crossed by the "Brig of Balgownie," an old Gothic one-arched bridge celebrated by Lord Byron; and a little farther down is a new bridge of five arches.

Don, a river of England, Yorkshire, rising upon Snailsden-pike near the borders of Cheshire, a few miles W.N.W. of Penistone, and falling into the Aire immediately below Snaith, after a course of about 50 miles. By means of artificial cuttings and canals it has been made navigable for 39 miles.

Don, a large river of Russia. See Russia.

Don Cossacks, land of, a province of Russia in Europe, taking its name from the river Don, by which it is traversed. It extends from N. Lat. 47. to 51., and from E. Long. 37. 20. to 44. 45., and contains about 62,300 square miles. The whole district is a plain, except on the S.E. part, where a low range of hills, a continuation of the Caucasian range, extends into the steppes. The soil is dry (consisting for the most part of a sandy clay), and the pasturage scanty, but near the river it is highly fertile. Besides the Don, it has other streams which mostly empty themselves into that river, but are in summer almost or wholly dry. Agriculture is but little pursued, and the corn raised is barely sufficient for the consumption. The breeding of cattle, especially of horses, is the chief occupation. Even the poorer Cossacks have from 5 to 10 horses, and many of the richer class from 500 to 1000. The fishing on the rivers and lakes is the branch of industry next in importance to the breeding of cattle. The feudal system prevails, the land is held by military tenure, and every man is a soldier. The country is divided into seven circles. Pop. (1846) 704,300. See Cossacks.

DONABUE, in the British province of Pegu recently acquired from the Burmese, a town situate within the delta of the river Irrawaddy. This place merits notice chiefly from its association with historical recollections. In 1825,

during the first Burmese war, it maintained a successful resistance against the assault of a British force under the command of Brigadier Cotton; and here in 1853, during the last war with the same nation, a detachment of British Sepoys, accompanied by a party of seamen and marines, under the command of Captain Granville Lock, R.N., suffered a repulse in an encounter with a Burmese force, and lost several officers, including its distinguished commander. Lat. 17. 10., Long. 95. 27. (E. T.)

DONAGHADEE, a seaport and market town of Ireland, county of Down, on the Irish Channel, 17 miles E.N.E. of Belfast. Pop. (1851) 2821. The town is built in the form of a crescent round the harbour. A new pier has recently been constructed, inclosing a basin of 7 acres in extent, with a depth of 16 feet at low water, and having a lighthouse at its extremity. It is not however a place of much trade. The principal exports are cattle, grain, and potatoes; and the imports coal, culm, and herrings. Many of the female inhabitants of the town are engaged in the embroidery of muslin; and in the neighbourhood are numerous flax mills. A submarine telegraph has been established between this town and Portpatrick in Scotland.

DONALDSON, Walter, a learned Scottish writer of the seventeenth century, was a native of Aberdeen, but the period of his birth has not been specified. His father was Alexander Donaldson, who is denominated an esquire: his mother was Elizabeth the daughter of David Lamb of Dunkenny.[1] In his youth, as he himself informs us, he attended David Cunningham, bishop of Aberdeen, and Sir Peter Young, during their embassy to the king of Denmark and to some of the princes of Germany. He returned to Scotland, but after a short residence he again visited the Continent; and he now prosecuted his studies in the university of Heidelberg, where the civil law was ably taught by the elder Gothofredus. It was perhaps in that university that he took the degree of LL.D.[2] While he resided at Heidelberg, he appears to have taken private pupils; for he mentions that he there read to some students a synopsis of ethics, which a young man named Werner Becker, a native of Riga, published without his consent or knowledge. This work, which was reprinted in Britain as well as in Germany, bears the title of "Synopsis Moralis Philosophiæ, III. libris;" *Ex officina Paltheniorum*, 1604, 8vo. He likewise complains that Keckermann had too unscrupulously availed himself of his labours, and he specifies a curious instance of this plagiarism. Donaldson afterwards settled in France, where he was appointed principal of the College of Sédan, and at the same time discharged the duties of professor of moral and natural philosophy, and of the Greek language; so that his attainments must have been various, and his labours not inconsiderable. In this Protestant seminary he was associated with two of his learned countrymen: Andrew Melville was one of the professors of divinity, and John Smith was one of the professors of philosophy.[3] His next publication, an arrangement in Greek and Latin of passages extracted from Diogenes Laertius, is entitled "Synopsis Locorum Communium, in qua Philosophiæ Ortus, Progressus, &c. ex Diogene Laertio digeruntur." Francof. 1612, 8vo. At Sédan he continued to reside for the space of 16 years, and was then invited to open a college at Charenton, near Paris; but the attempt was immediately resisted, and it seems to have been ultimately frustrated by the jealousy of the Papists. In order to occupy himself during the dependence of the legal process, he prepared for the press another learned work: "Synopsis Oeconomica, authore G. Donaldsono Scoto-Britanno, Abredonensi, J. C. ad celsissimum Carolum, Walliæ Principem." Paris, 1620, 8vo. It was reprinted at Rostock, 1624, 8vo; and another edition speedily followed, Francofurti, 1625, 8vo. Bayle considered this as a book which deserved to be read.[4] With respect to the subsequent history of the author we have not been able to collect any information; but it is not improbable that he resumed his station at Sédan, and there ended his days. Elizabeth Goffin, describing herself as the widow of Donaldson, addressed to Sir John Scott a letter dated at Sédan on the 15th of April 1630.[5] From this letter it appears that he left several children. (D. I.)

DONARIUM, in *Antiquity*, was used to designate the treasure chamber or place in a temple where the votive offerings were kept, and also the offering itself; and, by metonymy, was sometimes used to denote a temple, sanctuary, or altar. The custom of making presents to the gods was common to the Greeks and Romans; and these gifts were not only very various in kind, but frequently of the most costly description, such as gold and silver ornaments, statues, pictures, and, in short, everything that could enhance the magnificence of the terrestrial habitations of the gods.

DONATION (Lat. *donatio*), an act or contract by which a man transfers to another either the property or the use of the whole or a part of his effects as a free gift.

DONATISTS, ancient schismatics in Africa, so denominated from their leader Donatus. This sect arose in A.D. 311, when, in the room of Mensurius, who died in that year on his return to Rome, Cæcilian was elected bishop of Carthage, and consecrated by the African bishops alone, without the concurrence of those of Numidia. The people refused to acknowledge him, and set up in opposition Majorinus, who, accordingly, was ordained by Donatus, bishop of Casæ Nigræ. The Donatists were condemned in a council held at Rome two years after their separation; again, in another held at Arles the year following; and a third time at Milan in 316, before Constantine the Great, who deprived them of their churches, sent their seditious bishops into banishment, and even punished some of them with death. Their cause was espoused by another Donatus, called the Great, the principal bishop of that sect, who, with great numbers of his followers, was exiled by order of Constans. Many of them were punished with great severity. However, after the accession of Julian in 362, they were permitted to return, and restored to their former liberty. Gratian, however, in 377 deprived them of their churches. and prohibited all their assemblies. Yet notwithstanding the severities which they suffered, it appears that towards the close of this century they had a very considerable number of churches; but about the same time they began to decline, on account of a schism among themselves, occa-

[1] Litera Prosapiæ Alexandri Donaldson, Medicinæ Doctoris, dated at Edinburgh 15th November 1642. This is the son of Walter Donaldson. MS. Adv. Lib. W. 6. 26. p. 21. According to this account, one of his ancestors was Elizabeth Hay, daughter of George Earl of Errol.

[2] In the attested pedigree already quoted, we find mention made "Walteri Donaldson, Armigeri, Utriusque Juris Doctoris apud Ruppellam in Gallia;" but as Rochelle was not the seat of a university, we cannot but suspect the accuracy of the statement. A college, including a principal and four regents, was established there in the year 1561; but it did not obtain the privileges of a university, and had no law faculty, and no professor of law. (Expilly, Dictionnaire Géographique, Historique, et Politique des Gaules et de la France, tom. vi., p. 354.)

[3] M'Crie's Life of Melville, vol. ii., p. 420.

[4] Bayle, Dictionnaire Historique et Critique, tom. ii., p. 1013.

[5] Epistolæ doctorum Virorum ad Jo. Scotum, No. 227. MS. Adv. Lib. In the pedigree, she is described as the legitimate daughter "Joannis Goffan de Mostancells prope seden, et Joan. de Hen." For *seden*, we must apparently read *Sedanum*. The entire transcript, which is in the hand-writing of Robert Myln, is far from being accurate. In the preceding line, Donaldson's wife is called Hoffan. Her real name appears to have been Goffin.

sioned by the election of two bishops, in the room of Parmenian, the successor of Donatus. One party elected Primian, and were called *Primianists*, and another Maximian, and were called *Maximianists*. Their decline was also precipitated by the zealous opposition of St Augustin, and by the violent measures which were pursued against them by the Emperor Honorius, at the solicitation of two councils held at Carthage, the one in 404, and the other in 411. Many of them were fined, the bishops were banished, and some were put to death. The sect revived and multiplied under the protection of the Vandals, who invaded Africa in 427, and took possession of this province; but it sunk again under new severities, when their empire was overturned in 534. Nevertheless they remained in a separate body till the close of this century, when Gregory, the Roman pontiff, succeeded in suppressing them, and there are few traces of the Donatists to be found after this period. They were distinguished by other appellations, as *Circumcelliones*, *Montenses or Mountaineers*, *Campites*, *Rupitani*, and so on. They held three councils, or conciliabules, one at Cyrta in Numidia, and two at Carthage.

The primary errors of the Donatists consisted in holding that baptism conferred out of the church, that is, out of their sect, was null (for which reason they re-baptized those who joined their party from other churches, and re-ordained their ministers), and that theirs was the only true, pure, and holy church, all the rest of the churches being regarded as prostitute and fallen. From the Donatist controversies, the doctrine passed into the Catholic Church, that there is no salvation beyond the pale of the church, and that therefore men might be compelled to enter in. (Luke xiv. 23).

Donatus seems likewise to have inclined to the doctrine of the Arians, with whom he was closely allied; and accordingly St Epiphanius, Theodoret, and some others, accused the Donatists of Arianism; nor is it improbable that the charge was well founded, because they were patronized by the Vandals, who maintained that doctrine. But St Augustin affirms that the Donatists, in this point, kept clear of the errors of their leader.

DONATIVE (Lat. *donativum*), a present made by any person; called also *gratuity*.

The Romans made large donations to their soldiers, and hence the soldiers in time became the masters of the Romans. Julia Pia, wife of the Emperor Severus, is called on certain medals *mater castrorum*, because of the care she took of the soldiery, by interposing for the augmentation of their donatives.

The *donativum* or gift to the soldiers was also called *congiarium*, though by post-Augustan writers generally the latter term is used distinctively to signify a largess to the people. Salmasius, in his notes to Lampridius's Life of Heliogabalus, in mentioning a donative which that emperor gave of three pieces of gold per head, observes, that this was the common and legitimate rate of a donative. Casaubon, in his notes on the Life of Pertinax by Capitolinus, observes, that Pertinax made a promise of 3000 denarii to each soldier; also, that the legal donative was 20,000 denarii; that it was not customary to give less, especially to the prætorian soldiers; and that the centurions had double, and the tribunes more in proportion.

DONATIVE, in the canon law, a benefice given and collated to a person by the founder or patron, without either presentation, institution, or induction by the ordinary.

DONATORY, in *Scotch Law*, a donee of the crown; or one to whom property escheated to the crown is, on certain conditions, made over.

DONATUS, ÆLIUS, a celebrated grammarian of the fourth century, the author of a grammar, and also of *Notes on Terence and Virgil.* He taught rhetoric at Rome, where he had as his pupil the famous St Jerome. From the celebrity of his grammar, his name was in the middle ages used as a synonyme for that study.

DONAUESCHINGEN, a town of Baden, circle of the Lake, on the Brigach, 46 miles N.W. of Constance. Pop. 3000. In the court of the palace of the Prince of Fürstenberg is a spring, which some consider to be the source of the Danube. See DANUBE.

DONAUWERTH, or DONAUWORTH, a town of Bavaria, in the circle of Suabia, on the Danube, which is here crossed by a bridge and receives the Wernitz; 25 miles N. of Augsburg. Pop. 2700, principally employed in the raising of flax, hemp, and hops, and in trading by means of the Danube. The town is well built and surrounded by walls. It was formerly a free town of the empire, but since 1607 it has been in the possession of Bavaria. In the vicinity Marlborough gained a signal victory over the Bavarians in 1704.

DONCASTER, a municipal borough and market-town of England, in the west riding of Yorkshire, situated on the right bank of the Don, here crossed by two bridges, 36 miles S. by W. of York. It was the Danum of Antoninus, and was called by the Saxons *Dona Castre*, whence its present name is derived. The town stands on the Watling Street of the Romans; and coins, urns, and other Roman remains are occasionally dug up in the neighbourhood. It received its first charter of incorporation from Richard I. Under the new act it is divided into three wards, and governed by a mayor, six aldermen, and eighteen councillors. Doncaster is one of the cleanest and most agreeable towns in the kingdom. Among the public buildings the principal are the mansion house, a handsome structure, used for meetings of the corporation, concerts, &c., and which cost about L.10,000; Christ Church, erected in 1827–8, for which a sum of L.13,000 was bequeathed by the late J. Jarratt, Esq., a native of this place; the town-hall, gaol, theatre, market-house, &c. The parish church of St George was a spacious and elegant structure surmounted by a fine tower 141 feet high; but it was recently burned down and is at present (1854) in course of being rebuilt. There are a grammar and other schools, a public library, savings-bank, dispensary, union workhouse, Yorkshire institution for the deaf and dumb, and numerous public charities. About a mile S.E. of the town is the race-ground where the celebrated Doncaster races are held annually in the third week of September. They continue for five days. The grand stand is a magnificent and commodious edifice. Doncaster has several iron and brass foundries, and manufactories of sacking and linen. Market-day Saturday. The corn market is one of the largest in the kingdom. Pop. (1851) 12,052.

DONEGAL, a maritime county in the extreme N.W. of Ireland, in the province of Ulster; bounded on the N. and W. by the Atlantic Ocean; on the E. by Londonderry, or more strictly Lough Foyle, the Foyle river, and Tyrone; on the S. by the Bay of Donegal, and the counties of Fermanagh and Leitrim. According to the ordnance survey, it comprises an area of 1865 square miles, or 1,193,443 acres; of which 393,191 are arable, 769,587 uncultivated, 7079 in plantations, 479 in towns, and 23,107 under water.

Donegal, in Irish Dun-na-ngall, or the fortress of the foreigners, probably so named from a fortress erected here by the Danes, was anciently called Tir-conaill, or the country of Conall; and it was sometimes called O'Donnell's country, after the head chieftains of the district. The other chieftains of note were the O'Doghertys, MacSweeneys, O'Boyles, O'Gallaghers, O'Gormleys, O'Breslins, &c. Tyrconnell is connected with some of the earliest events recorded in Irish history or tradition. The chief castle of the O'Donnells, who became princes of Tyrconnell in the twelfth century, was at Donegal, and the place of their inauguration the rock of Doune in Kilmacrenan. The celebrated Red Hugh

O'Donnell, one of the most distinguished chieftains of the race, in conjunction with the Earl of Tyrone, became a formidable opponent to the government of Queen Elizabeth; but being ultimately defeated, he sailed to Spain to solicit fresh succours, was there seized with fever, and died at Valladolid. Rory O'Donnel, who was promoted to the chieftainship by the English government, and created Earl of Tyrconnel, a title now extinct, became afterwards disaffected to the government and fled to Rome, where he died in exile, his estates having been previously confiscated by James I. In 1608, Sir Cahir O'Dogherty, lord of Innishowen, deceived by hopes of aid from Spain, raised an insurrection against the English government in Ulster. He burnt Londonderry and maintained his ground for a short period; but the Lord-deputy Chichester having offered a reward for his head, he retired to the wilds of Kilmacrenan, and was shot by a Scotch settler in his encampment on the rock of Doune. His extensive estates were confiscated and transferred to Chichester, the able governor of Ireland at that time, and ancestor of the earls and marquises of Donegal. Shortly afterwards, the colonization of Ulster with English and Scotch undertakers and settlers, in pursuance of the scheme of James I., was partially carried out, and the baronies of Boylagh and Bannagh were allotted to John Murray; Sir James Cunningham, Sir John Stewart, and other Scotch undertakers, received the district of Portlough; the London Grocers' Company obtained Muff in Innishowen; Sir Roger Bingley, Sir John Kingsmill, and other English settlers the district round Lifford; Sir William Stewart, Sir John Kingsmill, Sir George Macburie, Captain Hart, Sir M. M'Swine, Turlogh Roe O'Boyle, MacSwine Bannagh, MacSwine Fannet, and other servitors and natives the district of Kilmacrenan. Since the period of the settlement of Ulster, no forfeitures have taken place in this county. The landholders remained loyal in the rebellion of 1641, and also during the war of the Revolution.

This district was formed into the county of Donegal in the reign of Queen Elizabeth, A.D. 1585, by the Lord-deputy Sir John Perrott. It is now divided into six baronies, viz., in the N. Innishowen, which is peninsulated by Loughs Foyle and Swilly, and the mountainous Kilmacrenan; in the W. Boylagh; in the E. Raphoe, including the best land in the county; in the S. Bannagh, a mountainous barony and Tyrhugh, containing the towns of Donegal and Ballyshannon. These six baronies are subdivided into fifty-one parishes, comprising the entire diocese of Raphoe, and small portions of the dioceses of Derry and Clogher. The union workhouses are at Ballyshannon, Donegal, Dunfanaghy, Glenties, Innishowen, Letterkenny, Milford, and Stranorlar. Portions of the county are included in the neighbouring unions of Strabane and Londonderry. The net annual value of property rated to the poor is L.267,398; and the amount of property valued under the 6th and 7th William IV., cap 84 (Griffith's Valuation), L.225,049. The county is in the Belfast military district, with barracks for infantry at Lifford and at Ballyshannon, where the staff of the county militia is stationed. The constabulary force, consisting of 275 officers and men, has its headquarters at Letterkenny; the district stations are at Buncrana, Ballyshannon, Carndonagh, Glenties, Dunfanaghy, Killybegs, Raphoe, and Ramelton. This county, as being the chief seat of illicit distillation in Ireland, affords occupation to a considerable portion of the revenue police, namely, to 220 men and officers, at 18 different stations.

The towns are small in extent and importance. Lifford, the county town, "the smallest of county towns," and formerly a parliamentary borough, is practically nothing more than a suburb of Strabane, in the neighbouring county of Tyrone, which derives all the advantages properly belonging to the county town of Donegal; and in the same manner the trade of Londonderry is swelled into greater magnitude by monopolizing that of the county of Donegal, which is deficient in the means requisite for carrying on its own commerce. Ballyshannon (population 3697) is the most populous and important town in the county. It stands on both sides of the noble river Erne, but has not yet derived much advantage from its favourable situation, in consequence of the fall of the river, usually called the Salmon Leap, above the town, and the bar at the mouth of the harbour. Were these impediments to its prosperity removed, as it is supposed they might be, the first by a canal four miles in length, and the other by a change in the position of the harbour, Ballyshannon would become an important commercial town. Letterkenny, with 1947 inhabitants, is next to Ballyshannon the largest town in the county. Rathmelton and Killybegs are inconsiderable seaports: and Donegal, which, instead of Lifford, should have been the county town, is of insignificant extent. It is situated at the foot of a range of magnificent hills in the midst of scenery of great natural beauty, with a mineral spa of the same quality as that of Harrogate, and sea-bathing close to the town. "Were all the advantages of scenery, locality, bathing, and cheapness of living, which this town possesses, connected with any English town, it would not be long before it was a second Brighton, or Bath, or Cheltenham."—*Foster's Letters on the Condition of the People of Ireland.*

This county returned no fewer than twelve members to the Irish parliament; two for the county at large, and two for each of the insignificant boroughs of Ballyshannon, Donegal, Killybegs, Lifford, and Johnstown. Since the union with Great Britain, it has been represented in the imperial parliament by two county members only.

The population of Donegal, according to the different enumerations taken by authority of parliament, has been returned as follows:—

Year.	Population.
1821	248,270
1831	289,149
1841	296,448
1851	255,160

The manners and habits of the people differ according to the local circumstances of the districts they inhabit. The lowland and fertile districts are chiefly peopled by an industrious and comfortable yeomanry, composed of small farmers and artizans, whose modes of life differ little from those in similar circumstances in the adjoining counties. In the mountainous and less cultivated tracts the want of free intercourse, and the consequent tardy spread of manufacturing and agricultural improvement, have occasioned a corresponding backwardness in education and civilization. "If you enter their cabins and converse with them frankly and kindly, you will find the people intelligent and communicative, quick to comprehend, and ready to impart what they know. Small holdings and minute subdivisions of land prevail in Donegal to a greater extent than I have found in any other part of Ireland; and the consequent growth of population has been there so great as to press hard upon the productive powers of the soil, and to depress the condition of the people to nearly the lowest point in the social scale, exposing them, under the not unfrequent contingency of an unfavourable season, or a partial failure of the potato crop, to the most dreadful privations. . . . Yet with all this suffering, no disturbance or act of violence has occurred in Donegal."—*Second Report of Mr Nicholls, Poor-Law Commissioner*, 1837.

The houses, particularly in the mountainous parts, are mean, and very little attention is paid to cleanliness. The pigs and cattle, if any, are not unfrequently housed along with the family. The fuel used by the people is everywhere turf; their food, potatoes and oaten bread, with milk and butter occasionally, and fish if near the sea. The men

are clothed in home-made frieze; the women, chiefly in cheap cottons. The Irish language still maintains its ground in the retired parts, though its use is every year diminishing. Adepts in the language consider the dialect spoken in this county as the purest known.

The state of instruction in the county of Donegal may be deduced from the following statement relating to the population above the age of five years:—

1851.	Rural Districts.	Civic Districts.	Total.	Proportion per cent.	
				Males.	Females.
Could read and write.....	47,415	1640	49,055	29	15
Could read only............	47,168	1121	48,289	19	23
Could neither read nor write......................	129,147	1715	130,862	52	62

This return exhibits a state of education much lower than that of any other county in Ulster. Yet crime, which is sometimes supposed to be in proportion to the ignorance of the population, is by no means frequent in Donegal; for although backward in the knowledge of the useful arts, the people are stained with few of the vices which indicate a demoralized state of society. The most common offences against the laws are connected with the practice of illicit distillation. The nature of the country peculiarly favours the operations of the unlicensed distillers, whose occupation is facilitated by an abundant supply of fuel and numerous inaccessible retreats, where they are able, by setting watches on the hills, to gain sufficient time to sink their tubs in the lake near at hand, knock off the head of the worm, and carry off the wort and whisky to the other side of the lake, before the revenue police could reach the scene of their operations.

In addition to the mountainous district, a considerable portion is high bog and moor land, making the general character of the surface of the county highland, inferior in elevation and grandeur to the Scottish highlands, but partaking of their nature, with a much larger proportion of bog land. The mountains and irregular groups of highlands occupy the whole interior of the county, sloping from Belleck on the border of Fermanagh in the south to Barnesmore hills northwards, turning westwards along the sea-coast by Killibegs to the great promontory of Tellen Head, from thence spreading northwards over the waste expanse of the Rosses round by the northern coast to Lough Swilly, and through Innishowen barony to Malin Head and Greencastle, rising occasionally to a considerable altitude. Arrigal mountain attains an elevation of 2462 feet above the level of the sea, and commands from its summit a fine panoramic view over a considerable portion of the county. Bluestack (2213 feet), Muckish mountain (2190 feet), in Kilmacrenan barony, and Slieve Snaght (2019), in Innishowen, are, next to Arrigal, the highest mountains. The eastern and southern portions of the county are comparatively level, and contain the most fertile land. Occasionally the scenery attains a character of savage and romantic grandeur in the highland districts and on the sea-coast, and of much beauty in the eastern part of the county; but a considerable portion of the surface, disfigured by bogs, entirely destitute of timber, and partaking of sombre sameness, may be described, in the language of the first Lord Bristol, as presenting "nothing curious to engage admiration, and nothing horrid enough to stare at."

The main body of the county rests upon mica slate, which forms the eastern districts and most of the barony of Bannagh. From Sheephaven to Lochrusmore and the north-western coast, granite forms the surface rock, and quartz is very abundant, often forming mountains of considerable elevation. Carboniferous or mountain limestone occurs round Donegal Bay. The geological aspect of the county affords many indications of internal wealth, which are in most cases but conjectural, very few attempts having been made to ascertain more accurately the mineral resources of the district. The minerals hitherto discovered are lead and iron. Mines of the latter of these metals were formerly wrought in the parish of Templecarne, until relinquished in consequence of the failure of timber for fuel. Manganese, copper pyrites, and clay for potteries and brick-making, are also found. Siliceous sand, raised in Muckish Mountain, and rolled down in bags, was formerly conveyed in large quantities to Belfast and Scotland for the manufacture of glass. Indications of coal have been observed near Lough Swilly, and at Inver on the southern coast; and marble of fine quality is found in many places. Among the mountain streams the pearl-mussel (*Unio margaritifera*) is sometimes found.

With the exception of the tidal river Foyle, which forms the boundary between this county and Tyrone and Londonderry, the rivers though numerous are of very inferior size. The branches of the Foyle which rise in Donegal are the Derg, issuing from Lough Derg, and the Swilly; the Finn rising in the beautiful little lake of the same name in the highlands, and passing through some of the best cultivated land in the county. The Foyle, augmented by their contributions, and by those of several other branches from Tyrone and Londonderry, proceeds northwards, discharging its waters into the southern extremity of Lough Foyle, at the city of Londonderry. It is navigable for vessels of large burden to this place, where their farther progress is prevented by a bridge; and thence by lighters of fifty tons as far as Lifford. Boats of fourteen tons can proceed up the Finn river as far as Castlefinn. The fine river Erne flows from Lough Erne through the southern extremity of the county into the southern extremity of Donegal Bay. Its navigation is prevented by a fall of 12 feet, generally called the Salmon Leap, in the neighbourhood of Ballyshannon, and by rapids between Ballyshannon and Belleck, on the confines of Fermanagh. Schemes for opening the navigation to the sea have been formed, but never carried out. The Guibarra, the Awen Ea, and the Eask, are the only other streams of any note.

Lakes, or rather loughlets, are very numerous in Donegal. The most remarkable, and also the largest in the county, is Lough Derg, comprising within its waters several small islets, on one of which, Station Island, is the cave named Saint Patrick's Purgatory, a celebrated place of resort for pilgrims and devotees—the victims of ignorance and superstition. The penances consist of constant prayer, fasting, and vigils. The circumference of the lake is about nine miles, and less than one acre is the extent of the island to which the pilgrims are ferried over. "Stowed like so many brutes in the bottom of the boat from front to stern—the master shoving and pushing them as he would a drove of pigs—no one could contemplate the scene without being forcibly reminded of the paintings of Charon and his cargo of damned." (*Inglis.*) The landscape around Lough Derg is desolate and sombre in the extreme. Barren moors and heathy hills, possessing neither form nor elevation, surround it on all sides, without one green spot, house, or tree, to refresh the eye. The other lakes are worthy of note only as being the sources of most of the rivers of the county.

The county of Donegal possesses a large extent of sea-coast indented by numerous bays and inlets. Ballyshannon harbour, the most southern of them, is small, and has a bar at its mouth, as have Donegal and Inver harbours farther west. Killibegs harbour is well sheltered, and capable of receiving large vessels. On the western coast are Bruckles or M'Swiney's Bay, and Tellen harbour, suitable for small vessels; and on the north is Sheephaven, within which is Dunfanaghy Bay, where the largest ships may lie in safety, as they may also in Mulroy Bay, farther east. Lough Foyle, which divides Donegal from Londonderry, is a noble sheet of water, but shallow and dry at ebb tide, contracted at its

entrance, and encumbered with shoals. A few miles from Malin Head, the most northerly portion of the mainland of Ireland, the varied and extensive Lough Swilly runs far into the interior. From these two loughs much land has of late years been reclaimed.

Numerous islands, islets, and isolated rocks stud the coast of Donegal. The largest is Arranmore or North Arran, about fifteen miles in circumference, with a lofty hill in its centre, and a gradual declivity down to the sea. On another of the Arran group of islands Innismacdurn, a town named Rutland, with stores and curing houses, was built in the last century, and the herring fishery cultivated with spirit; but the fishery having declined, the place is now in a ruinous condition. On the northern coast are Tory Island, on which is one of those singular round towers marking the holy places of ancient times, and Innistrahul the *ultima Thule* of Ireland. The inhabitants of the islands obtain a precarious livelihood by fishing, kelp-burning and rude husbandry, but are often reduced to extreme destitution.

The fishery districts of the county are—Dunfanaghy, Killibegs, and Carne, together comprising 395 miles of maritime boundary, employing about 2000 vessels and 9000 men and boys. In the project for the plantation of Ulster, drawn up in the early part of the reign of James I., twenty-five places in this county are named as being approved stations for the salmon, herring, and ling fishery. The principal salmon fishery at present is at Ballyshannon.

There are several mineral springs in the county, the chief of which is the sulphureo-chalybeate water at Killymard, adjoining the town of Donegal and of considerable local celebrity.

The modes of agriculture present little peculiar to the county, and the spade still supplies the place of the plough where the rocky nature of the surface prevents the application of the latter implement. The soil of the greater portion of the county, *i.e.* the granite, quartz, and mica slate districts, is thin and cold, while that on the carboniferous limestone is warm and friable. The number of holdings exceeding one acre in extent, in 1852 was 31,607; in 1853, 31,139—being a decrease of 468. In 1853 the number of cottier tenements or holdings which do not exceed one acre in extent, have somewhat increased in number over those of the previous year.

The division of land into holdings during the years 1852 and 1853 was as follows:—

	Not exceeding 1 Acre.	From 1 to 5 Acres.	From 5 to 15.	From 15 to 30.	From 30 to 50.	From 50 to 100.	From 100 to 200.	From 200 to 500.	Above 500.
1852......	668	3147	11,273	8872	4086	2914	857	352	106
1853......	697	2942	10,396	8121	4227	2901	864	334	114

The extent of land under crops in 1853 was 236,097 acres, being 792 or 3 per cent. less than in 1852; which year, however, showed an increase of 4·1 per cent. over the year preceding.

The crops on the land were divided in the following manner:—

	Corn, Peas, and Beans.	Potatoes.	Turnips, Mangold-Wurzel, &c.	Cabbage, &c.	Flax.	Meadow.
1852........	122,286	37,331	18,385	1945	21,604	35,338
1853........	118,547	39,221	18,876	1832	25,610	32·011

The total produce of corn, beans, and peas in 1853 was 76,688 tons, or an average of 673 lbs. per head, being 27 lbs. per head below the average of all Ireland: that of potatoes averaged 181 stones per head (41 stones above the general average), or a total produce of 2,307,993 barrels.

Of the 32 counties of Ireland arranged in the order of the condition of their farms as to cultivation, Donegal stands number 30 on the list, and number 28 in the comparison of the state of the road-sides as to the growth of weeds. The live stock in the county, in 1852, on 31,607 holdings, consisted of 23,025 horses, 1946 mules and asses, 149,852 cattle, 88,410 sheep, 17,731 pigs, 2946 goats, and 314,265 poultry, of the total value of L.1,289,750. The estimated value of stock in 1841 was L.882,203.

In proportion to its extent, Donegal contains a larger portion of uncultivated land, and a smaller area occupied by towns or plantations, than any other county in Ireland. On the authority of Mr Griffiths, the general valuation commissioner, and the commissioners of inquiry into the occupation of land in Ireland, it is stated as matter admitting of no doubt, that, notwithstanding the wetness of the soil, and the nature of the subsoil, "vast tracts may be easily reclaimed by the expenditure of a moderate capital, and the introduction of additional labourers. From a careful examination, it would appear that Donegal contains about 760,000 acres of unimproved and uncultivated land, 253,000 of which are situated at elevations which exceed 800 feet above the level of the sea; and, in such a climate, unless in favoured and sheltered spots, cultivation should not be attempted at elevations exceeding 800 feet. It is probable that, within the limits of the county of Donegal, there are about 150,000 acres which might be improved for cultivation, 250,000 acres might be drained and thus rendered available for the rearing of young cattle, and 369,000 acres of mountain land which it is probable would not repay the expense of draining." The reclamation of these 150,000 acres capable of being improved for cultivation would afford both present and future employment for the entire labouring population, increase the means of tenant farmers, and in addition to these advantages create a considerable rental for land now almost worthless. In some instances the process has been successfully carried out in spite of the torpidity and prejudice of the population, who are accustomed to regard as of paramount importance the amount of rent rather than the value or capabilities of the land for improvement. A remarkable and instructive instance of what may be accomplished in the most remote districts, and under great disadvantages, is recorded in Lord George Hill's work, "Facts from Gweedore," describing the circumstances of a large estate, exceeding 23,000 acres, in this county, the condition of its inhabitants, and the means employed to convert a property and community from a state of utter neglect, poverty, and disorganization, into one of order and comfort.

Gweedore is situated in the remote north-western portion of the county, in the midst of wild and magnificent mountain scenery, and when purchased by Lord George Hill, was almost wholly uncultivated, but in part thickly peopled, the population being in the most poverty-stricken condition; "famine was periodical among them, with fever as its attendant, and wretchedness pervaded the district." The land was held in rundale, *i.e.* a tenant had his proportion of a town-land sometimes in thirty or forty different places, each tenant considering himself entitled to a portion of each various quality of land, and the man who had some good land at one extremity was sure to have some bad at the other, and a bit of middling in the centre, and bits of other quality in odd corners, each bounded by his neighbour's holdings. Rents were almost nominal, and they were collected at fairs in small sums as they could be got; often no receipt being given, and no accurate account kept. There were arrears of eight, ten, and even twenty years' standing, and many lived on the estates who were quite unknown. The rents in fact were so small, numerous, and difficult to be obtained, that they were not worth the trouble and expense of collecting. There were no fences between the small patches

of land; and "fights, trespasses, confusion, disputes, assaults, and litigation, were the natural and unavoidable consequences of this system." There was neither inn, road, nor market within a dozen miles, and the only alternative therefore was for the people to distil their grain into whisky. The people had become so far degenerated as to be reconciled to the state of things, and the chief obstacles to improvement were found in their ignorance and prejudices; yet, by skilful management and perseverance, this portion of the county has been raised to a state of comparative independence. Notwithstanding much neglect, there are many other instances of improvement in this county; prominent among which is Sir Charles Style's estate of Cloghan (16,000 acres), in Glenfinn, not many years ago an uncultivated waste, inhabited by *potheen* makers, but now annually covered with rich crops.

In Donegal, as in other counties of Ulster, the linen manufacture affords employment for many of the people, especially in the neighbourhood of the Foyle and about Raphoe, Letterkenny, Stranorlar, and also to some extent near Ballyshannon. There are many corn mills in the county, but the export trade is carried on through the port of Londonderry.

Numerous ruins of ancient castles along the coast prove that much attention was formerly paid to the defence of the country from invasion, or, what was more to be dreaded, piratical depredations. The principal are—Kilbarron Castle, an ancient stronghold of the O'Clerys, near Ballyshannon; Donegal Castle, built by the O'Donells, anciently their chief residence, and now a fine ruin standing close to the water's edge; Burt Castle, built in the reign of Henry VIII. on the shores of Lough Swilly by Sir Cahir O'Dogherty, to whom is also attributed the erection of Green Castle, one of the strongholds of the clan on Lough Foyle. Near the Castle of Doe, or M'Swiney's Castle, at Horn Head, is a natural perforation in the roof of a cave, called M'Swiney's Gun, wrought by the workings of the ocean into the overhanging cliff. When the wind blows due north, and the tide is at half flood, the gun is seen to spout up jets of water to a height of 100 feet, attended with explosions heard occasionally in favourable weather at an immense distance. Culmore Fort, on the coast of Lough Swilly, supposed to have been erected by the O'Doghertys, having come into the possession of the crown, was granted in 1609 to the corporation of London. It was afterwards enlarged or rebuilt, and acted a prominent part in the celebrated siege of Derry. It is, and has been for the last century and a half, unoccupied as a military station, although the governorship of Culmore and Londonderry is still continued as a post of honour and emolument.

Traces of religious houses, some existing only in traditionary or documental records, are also numerous. Ashroe Abbey, on a small stream near Ballyshannon, was of great extent. The ruins of that of Donegal, founded in 1474, also afford proofs of its ancient grandeur. But its memory will be held in veneration by the lovers of antiquity as the place in which was written the celebrated collection of ancient Irish annals, still known by the name of the Annals of the Four Masters, and sometimes called the Annals of Donegal, compiled in the year 1632, by Michael O'Clery and his learned coadjutors, fellow brothers in that house, at the instigation and expense of Fergal O'Gara, lord of Moy O'Gara and Coolavin, in the county of Sligo. The original of this curious and valuable manuscript is now in the library of the Royal Irish Academy. (H. S—R.)

DONERAILE, a market-town of Ireland, county of Cork, on the Awbeg, here crossed by a handsome stone bridge, 6 miles N.N.E. of Malone, and 23 miles N.N.W. of Cork. It is a small but neat town, with a parish church, a spacious Roman Catholic chapel, a nunnery, courthouse, and dispensary. Pop. (1851) 1856. Previous to the Union it sent two members to the Irish parliament. About two miles N. of the town are the ruins of Kilcolman Castle, at one time the residence of the poet Spenser.

DONGOLA, a province of Nubia, extending along the banks of the Nile, from about 18. to 19. 30. N. Lat., but having generally a breadth of only from 1 to 3 miles. It is chiefly famous for its horses, which rival in beauty the finest Arabian breeds, besides being larger, and having more bone. The principal towns are New and Old Dongola.

DONGOLA, *New*, or *Marakah*, stands on the left bank of the Nile, in Lat. 19. 7. 30. N., and Long. 29. 54. 35. E., according to Linant; but according to Rüppell, in Lat. 19. 10. 19. N., Long. 30. 22. 15. E. It has taken its rise within the last forty years; and is now a considerable town, and a resting-place for the caravans from Kordofan and Senaar. The bazaar is well supplied with shoes, printed cottons, calicoes, rice, sugar, coffee, hardware, &c. from Cairo. It has large barracks, and a manufactory for indigo. Pop. about 6000.

DONGOLA, *Old*, lies to the S. of the preceding, on the right bank of the Nile. It was formerly a place of some importance, but is now in ruins, and does not contain more than 300 inhabitants. The sand has accumulated here in such quantities, as in many parts to conceal the houses, while others of them are only accessible by the roof.

DONGURPORE, in Hindustan, a town, the chief place of a petty native state of the same name, situate in the province of Rajpootana. This territory extends from Lat. 23. 35. to 24. 3., and from Long. 73. 40. to 74. 18. It contains an area of 1000 square miles, and its population is estimated at 100,000. Its chief is descended from a branch of the Odeypore family, whose ancestors became dependent on the emperor of Delhi, and so continued until subjugated by the Mahrattas, from whose yoke the country was rescued by the British. The treaty by which the British connection was established with this state was concluded in 1818. The town of Dongurpore is distant north from Bombay 345 miles. Lat. 23. 50. Long. 73. 50. (E. T.)

DONJON, or DUNGEON, the principal tower in ancient castles, underneath which there were vaults in which prisoners were confined. It was likewise called the *Keep*. See CASTLE.

DONNE, DR JOHN, a poet and divine, was born at London in 1573. His parents were of the Roman Catholic faith, and used their utmost efforts to keep him firm in the same persuasion; but an early examination of the controversy between the Church of Rome and the Protestants determined him to adhere to the creed of the latter. After having prosecuted the study of law for some time at Lincoln's Inn, he travelled into Italy and Spain, where he learned the languages of both countries to perfection. Soon after his return to England, Sir Thomas Egerton, keeper of the great seal, appointed him his secretary; and in this post Donne continued five years. Having however married privately Anne, the daughter of Sir George Moore, then chancellor of the garter, and niece to the lord keeper's lady, he was dismissed from his situation at the instigation of his father-in-law, and thrown into prison. But he was afterwards reconciled to Sir George by the good offices of Sir Francis Wooley. In 1612 he accompanied Sir Robert Drury to Paris. During this time many of the nobility solicited the king to give him some secular employment. But James I., who took pleasure in his conversation, and was highly delighted with his *Pseudo-Martyr*, a polemic treatise against Catholicism, printed at London in 1610, prevailed on the author to enter into holy orders, and appointed him one of his chaplains. He also procured him the degree of doctor of divinity from the university of Oxford. In 1619 Dr Donne attended the Earl of Doncaster in his embassy into Germany. In 1621 he was made dean of St Paul's; and the vicarage of St Dunstan in the West soon afterwards fell to him. Besides the work above men-

tioned, he wrote *Devotions upon emergent Occasions; the Ancient History of the Septuagint*, translated from the Greek of Aristeas, 1633, 12mo; *Three volumes of Sermons*, 1640, 1649, 1660, folio; A Treatise against suicide, entitled *Biathanatos;* and Poems.

Donne's writings show him to have been a man of wit and learning; but he chiefly excelled in satire. Lord Falkland, no mean judge, styles him one of the most witty and most eloquent of modern divines. His reputation as a poet was higher in his own time than it has been since. Dryden, with his usual judgment and discrimination, characterizes him as "the greatest wit, though not the best poet, of our own nation;" and adds, that "he affects metaphysics, not only in his satires, but in his amorous verses, where nature only should reign, and perplexes the minds of the fair sex with nice speculations of philosophy, when he should engage their hearts and entertain them with the softness of love." Donne's numbers, if they may be so called, are certainly the most rugged and uncouth of any of our poets; yet he was by no means ignorant nor unskilled in the higher attributes of style, for he wrote elegantly in Latin, and displays considerable taste in some of his smaller pieces and epigrams.

DONNYBROOK. See Dublin, *County of.*

DOOMSDAY Book. See Domesday Book.

DOON, a small river of Ayrshire, Scotland, immortalized by Burns. It rises in Loch Doon, a lake about 6 miles in length and $\frac{3}{4}$ths of a mile in breadth; and after a course of 18 miles falls into the Firth of Clyde, 3 miles S. of Ayr.

DOORNIK, the Flemish name of Tournai. See Tournai.

DOOSHAK, a town of Afghanistan. See Jelalabad.

DOR, the English name of the black beetle, or the hedge-chafer, a species of Scarabæus.

DORADO, a southern constellation of six stars, not visible in our latitude. It is also called *xiphias.*

DORAK, or Felahi, a town of Persia, province of Khuzistan, situated in low and marshy ground, on two branches of the river Jerahi, 75 miles S. of Shuster. It is surrounded by mud walls about 2 miles in circumference, 16 feet thick, and flanked with towers. It contains few houses within the walls, as the majority of the people prefer living in the suburbs, under the shade of date trees. Dorak is celebrated for its manufacture of Arabian cloaks, which are exported in great numbers, but it has little other trade. Pop. about 8000.

DORCHESTER (the *Durnovaria* of the Romans), a parliamentary and municipal borough and market-town of England, capital of the county of Dorset, situated on an eminence on the right bank of the Frome, 8 miles N. of Weymouth, and 120 miles from London by railway. It is governed by a mayor, four aldermen, and twelve councillors, and returns two members to parliament. Pop. of burgh (1851) 6394. Registered electors (1851-52), 432. The town, consisting chiefly of three spacious streets, is neat and pleasantly situated, and is nearly surrounded by a fine avenue. St Peter's church is an ancient edifice in the perpendicular style, containing some curious monuments. The grammar-school has two exhibitions to St John's College, Cambridge, and one to either university. Of the other public buildings the principal are, the town-hall, with market-house, shire-hall, county jail and house of correction, theatre, and county hospital. The cavalry barracks in the vicinity may also be noticed. There are also several almshouses and other charities, and a savings-bank. Market-days, Wednesday and Saturday. Its woollen manufacture was once considerable; but it is now noted principally for its ale. Dorchester is a place of considerable trade, and large sheep and lamb fairs are held here annually. The borough includes four parishes, All-Saints, St Peter's, Holy Trinity, and Fordington. In the vicinity there are some interesting Roman remains, including an amphitheatre, the most perfect of its kind in England. The seats for the spectators are formed of masses of chalk, rising 30 feet above the arena. This amphitheatre when perfect is supposed to have been capable of accommodating 13,000 spectators. Durnovaria was one of the principal stations in England of the Romans, by whom it was surrounded with a wall and fosse; part of the former having been standing as late as 1802. Here Judge Jeffries's "bloody assize" was held in September 1685.

Dorchester (the ancient *Durocina*), a village, formerly a market-town of Oxfordshire, situated at the junction of the Thame with the Thames, 50 miles from London. In 635 it was made the seat of a bishopric, which was removed to Lincoln in 1086. The church is a curious old building in the Norman and later styles; it has a leaden font said to be the most ancient of its kind in England; four brasses, effigies of bishops; and a window of richly painted glass, representing the genealogy of Christ from Jesse. Numerous Roman remains have been found in the vicinity.

DORDOGNE, an inland department in the S.E. of France, taking its name from its principal river the Dordogne, and formed out of the old province of Périgord, with a small portion of Limousin. It is bounded on the N. by Haute Vienne, W. by Charente and Charente-Inférieure, S.W. by Gironde, S. by Lot-et-Garonne, and E. by Lot and Corrèze. It extends from 44. 35. to 45. 42. N. Lat., and from 0. 0. to 1. 28. E. Long., being about 77 miles in length from N. to S., and 69 in breadth from E. to W. In extent it is only exceeded by the departments of Gironde and Landes, its area being 2,261,781 acres, or 3534 square miles. It is divided into five arrondissements, with cantons, communes, and population, as follows:—

	Cantons.	Communes.	Pop. 1851.
Perigueux	9	116	110,748
Bergerac	13	187	118,247
Nontron	8	87	86,697
Riberac	7	93	73,177
Sarlat	10	146	116,920
	47	629	505,789

This department belongs almost wholly to the basin of the Dordogne; and, though it has no mountains properly so called, it is very hilly, the greater part of it being covered by low projections of the Limousin and Auvergne mountains. The highest elevations are in the S.E., but even there they do not exceed 650 feet in height. Dordogne is formed by the union of two mountain streams, the Dor and the Dogne, which rise in Mont d'Or, Puy-de-Dôme, and unite after a short course. It flows westward through the departments of Corrèze, Lot, Dordogne, and Gironde, and after a course of 250 miles (for 180 miles of which it is navigable), joins the Garonne 13 miles N. of Bordeaux. Its principal affluents are the Vézère and the Isle, both of which are in this department. The climate is on the whole agreeable and healthy, but rather humid, the winter and spring being generally rainy. The prevailing winds are from the north and west. A great part of the department consists of arid heaths and wastes incapable of cultivation. Sufficient corn, however, is grown for home consumption. About one-tenth of its entire surface is taken up in the cultivation of the vine. Its red and white wines are in high repute. In the forests the prevailing trees are the oak and the chestnut. The fruit of the latter is much used both as food by the people and for fattening hogs. The walnut is extensively cultivated for making oil. The truffles of this department are considered the best in France. Dordogne is rich in various kinds of minerals, as iron, copper, lead, manganese, coal, marble, alabaster, lithographic stones, gypsum, &c. The chief branches of industry are the working in metals, particularly iron and steel, and the manufacture of paper. Dordogne also produces coarse woollens, serges, leather, earthenware, hosiery, beer, brandy, &c. The language is a patois of French and Provençal.

DORIA, Andrea, the famous Genoese admiral, was born at Oneglia in 1466. He entered into the service of Francis I. of France, and commanded his fleet in the Mediterranean, but preserved that spirit of independence which is so natural to a sailor and a republican. When the French, however, attempted to render Savona, long the object of jealousy to Genoa, its rival in trade, Doria remonstrated in a high tone against the measure; and this bold action, represented by the malice of the courtiers in the most odious light, irritated Francis to such a degree that he ordered his admiral Barbésieux to sail for Genoa, then in the hands of the French troops, to arrest Doria, and to seize his galleys. But Doria got a timely hint of this rash order; retired with all his galleys to a place of safety; and, whilst his resentment was warm, closed with the offers of the emperor Charles V., returned his commission with the collar of St Michael to Francis, and hoisted the imperial colours. To deliver his country, now weary alike of the French and the imperial yoke, from the dominion of foreigners, was Doria's highest ambition; and the favourable moment had presented itself. Genoa was afflicted with the pestilence, the French garrison was ill paid and greatly reduced, and the inhabitants were sufficiently disposed to second his views. He sailed to the harbour with thirteen galleys, landed five hundred men, and made himself master of the gates and the palace with very little resistance. The French governor with his feeble garrison retired to the citadel, but was soon forced to capitulate; upon which the people speedily levelled the citadel with the ground. It was now in Doria's power to have rendered himself the sovereign of his country; but, with a magnanimity of which there are few examples, he assembled the people in the court before the palace, disclaimed all pre-eminence, and recommended to them to settle what form of government they chose to establish. The people, animated by his spirit, forgot their factions, and fixed that form of government which, with little variation, subsisted until 1815. Doria afterwards engaged in an expedition against the Turks, from whom he took Coron and Patras. He also co-operated with Charles V. in the reduction of Tunis and Goulette. In 1547 two successive attempts were made against his life by Fieschi and a Genoese emigrant of the name of Giulio Cibo. He resigned his command in 1556, and died at Genoa in November 1560, being then ninety-four years of age. He is still celebrated in Genoa by the most honourable of all appellations, the Father of his Country, and the Restorer of its Liberty.

DORIAN or Doric *Mode*, in *Music*, one of the most ancient Greek modes or scales. It was equivalent to *d, e, f, g, a, b, c, d*, in which the two semitones occur between the second and third, and the sixth and seventh notes.

DORIANS, a people of Greece, who derived their origin from those districts in which the Grecian nation bordered towards the north upon numerous and dissimilar races of barbarians. According to Herodotus, they were from early times one of the chief races of that nation, which, in fact, was composed of Dorians and Ionians; the one of Hellenic and the other of Pelasgic origin, the former a migratory and the latter an aboriginal race. In this definition it is assumed that the Pelasgi were Greeks and spoke the Grecian language in its elder form; an opinion in support of which many arguments might easily be adduced. But all the races whose migrations took place at a comparatively late period, such as the Achæans, Ionians, and Dorians, particularly the last, were not sufficiently numerous or powerful to effect a complete change in the customs of a barbarous population: many districts, as Arcadia and Perrhæbia, remained entirely Pelasgic, without being inhabited by any nation not of Grecian origin: the most ancient names either of Grecian places, or those mentioned in the traditions of the Grecian race, belonged indeed to a different era of the dialect, but not to a different language: and, lastly, the great similarity between the Latin and the Greek can only be explained by supposing the Pelasgic language to have formed the connecting link. The Dorians are mentioned in ancient legends and poems as having been established in one extremity of the great mountain chain of Upper Greece, namely, at the foot of Mount Olympus; but there are, nevertheless, many reasons for supposing that, at a period still earlier than that to which these monuments refer, they dwelt at its other extremity, reaching to the farthest limit of the Grecian nation. Indeed the Doric Hylleans had a tradition that they came originally from those northern districts which bordered on the Illyrians, and were afterwards occupied by that people; a tradition, we may observe, which many facts and circumstances unite to confirm, or at least to render highly probable. Be this as it may, however, the earliest ascertained seat of the Dorians was the district of Mount Olympus. But, either from a restless and wandering disposition, or impelled by the pressure of some northern hordes, they seem to have migrated from this district into Crete, that is, from one end of the Grecian world to the other; thus presenting a striking anomaly in the history of the ancient colonies. The earliest trace of this circumstance is found in the Odyssey, where it is mentioned that the "thrice divided" (τριχαΐκες) Dorians formed part of the population of Crete. Though originally inhabiting a mountainous region, they appear, in course of time, to have become, as it were, the Normans of Greece, and to have sought settlements wherever they could find them. But the most important, and the most fertile in consequences, of all the migrations of the Grecian races, and that which continued even to the latest period to exert its influence upon the Greek character, was the expedition of the Dorians into the Peloponnesus. This circumstance is mentioned by Herodotus, who states that, under Deucalion, they dwelt in Phthiotis, and in the time of Dorus, the son of Hellen, inhabited the country at the foot of Ossa and Olympus, called Hestiæotis; that, afterwards, being driven from Hestiæotis by the Cadmeans, they dwelt under Mount Pindus, and were called the Macedonian nation; that thence they again migrated to Dryopis, and from Dryopis passed into the Peloponnesus, where they were called the Doric race. The traditionary name of the expedition in question is "the Return of the descendants of Hercules," who are admitted to have been of Doric origin; and, in process of time, successive conquests were effected by them in the Peloponnesus, until the whole of that country was at length subdued and occupied by the Dorians. Argos was captured by this people; Sicyon was conquered from Argos, Phlius from Sicyon, and Cleonæ from Argos. The Dorians expelled the Ionians from Epidaurus, and afterwards reduced Ægina and Trœzen; they appear also to have made themselves masters of Corinth and Megara; and, under Aristodemus, they conquered Laconia, which soon afterwards rose into great importance among the states of Greece. In due time, Doric colonies from Argos, Epidaurus, and Trœzen established themselves on the south-west coast of Asia Minor; and other colonies of the same race also settled in different parts of the same country, where, at a very early period, we find them forming a league against the Ionians, whom they had either encroached upon or expelled. In fact, there is nothing so remarkable in the history of this remarkable race as its extraordinary propagation and diffusion. In course of time it spread itself on all sides, from Greece to Asia Minor, Byzantium, Syracuse, and the country which sweeps round the Gulf of Tarentum, including the territory afterwards known by the name of Magna Græcia, with Crotona, Locri, and Lyctus, to say nothing of Chalcis, Solium, Ambracia, Anactorium, Leucadia, Corcyra, Epidamnus, Apollonia, Potidæa, Chalcedon, Trogilus, Thapsos, Selinus, and other places, which it conquered or colo-

Dorians.

nized. It is remarkable that, wherever any portion of Doric invaders or settlers proceeded, they not only carried along with them, but gave a permanent ascendency to the peculiarities and characteristics of their race. Their religion, their laws, their literature, their manners, and in short all that distinguished them as a separate people, appear to have taken root wherever they pitched their tents; and it is by the vestiges which still remain of their migrations, settlements, and power, that we are enabled to trace with some degree of certainty events which either took place before the commencement of authentic history, or in regard to which history, tradition, and even fable, are alike silent. The limits of this article, however, preclude our entering into details, which in fact would require volumes for their full development and illustration. We shall therefore confine ourselves to some general remarks on the character of the Dorians, deduced from the masterly analytical investigations of Karl. O. Müller in his *History and Antiquities of the Doric Race;* a work not more distinguished for its almost boundless erudition, than for the critical sagacity and philosophic spirit which is displayed in it throughout.

And the first peculiarity in the Doric character which we shall notice, is the tendency which it exhibited to produce uniformity and unity. Every individual was destined to remain within those limits which were prescribed by the will of the whole; every one was bound to obey in his own place. All the smaller associations were regulated on the same principle; there was a gradation of power, but never independent equality. The Dorians also had little inclination to admit the customs of others, and strong desire to disconnect themselves from foreigners; their instinct seems to have been to adhere scrupulously to their own national habits, and to preserve that distinct individuality of national character which appears to have given them so decided an ascendency over all the races amongst which they intermingled or settled. They loved independence, and knew well how to maintain and defend it. A calm and steady courage was the natural quality of the Dorians; and though they sometimes yielded to the impetuosity of excitable and enthusiastic enemies, their fortitude and pertinacity commonly secured them the victory, and almost always prevented defeat from degenerating into disaster. As they were not ready to receive, neither were they prone to communicate, outward impressions; and hence, both in their poetry and prose, the narrative is often concealed by expressions of the feeling, and tinged as it were with the hue and colour of the mind. They endeavoured always to condense and concentrate their thoughts, which was the cause of the great brevity and obscurity of their language; and as their attention was turned to the past rather than the future, they cherished an ardent attachment to the usages and manners of their forefathers, as embodied and preserved in their actual institutions. Hence the Dorians preserved most rigidly, and represented most truly, the customs of the ancient Greeks. They were not a stationary, far less a retrograding people; but the advances which they made were slow, and all their changes imperceptible.

With the desire to attain uniformity, for which the Dorians were distinguished, there was also combined in their character another remarkable peculiarity, namely, a love for measure and proportion. Their works of art are conspicuously marked by this attention to singleness of effect; and everything discordant or useless was pruned off with an unsparing hand. Their moral system also prescribed the observance of the proper medium in all things; and it was in this that the temperance which so distinguished them consisted; it was the synonyme, not of abstinence, but of moderation. One great object of the worship of Apollo, which the Dorians introduced into Greece, was to maintain undisturbed the balance of the mind, and to remove everything calculated to disquiet the thoughts, inflame the passions, or overcloud the serenity of the soul. The nature of this singular race seems to have required an equal and regular harmony; and for this reason dissonances, even if combined into harmony, were by no means suited to their taste. The national song was doubtless not remarkable for soft or pleasing melody; and the general accent of the language had the tone and character of command, without any of that delicacy or flexibility which are required in Elysian airs or Lydian measures. But the Dorians were contented with themselves, and with the powers to which they owed their existence and their happiness; in almost every sense, they were a self-centred race, living in themselves and for themselves; they looked not to future, but to present existence, and they loved their own laws, religion, institutions, manners, customs, literature, and arts, too much to envy those of other nations, or even desire to imitate them. Man was the chief and almost only object which attracted their attention. This feeling may be detected in their religion, which was always unconnected with the worship of any natural object, and originated solely from their own reflections and conceptions; and to the same source may perhaps be traced their aversion to mechanical and agricultural labour, a feeling which belongs and is indeed natural to minds of a contemplative turn. In a word, the whole Doric race bears the stamp and character of the male sex among nations; the desire of assistance and connection, of novelty and curiosity, the characteristics of the weaker sex, being directly opposed to the nature of the Dorians, which, from first to last, was marked by severe simplicity, inflexible independence, subdued strength, and unquenchable nationality. (See Müller's *History and Antiquities of the Doric Race*, English translation, Oxford, 1830, 2 vols. 8vo.) (J. B—E.)

Doric.

DORIC, pertaining to Doris, or to the Dorians.

Doric, in *Architecture*, the second of the five orders. See Architecture.

Doric *Dialect*, one of the five dialects, or forms of speech, which prevailed among the Greeks. It was first used by the Lacedæmonians, and particularly by those of Argos; and thence it passed into Epirus, Libya, Sicily, and the islands of Rhodes and Crete. Pindar used the Doric dialect in his poems, as did also Archimedes and Theocritus, who were both Syracusans.

In strictness, however, we should rather define Doric the manner of speaking peculiar to the Dorians, and which afterwards came to prevail among the Lacedæmonians and other states. Some even distinguish between the Lacedæmonian and Doric; but in reality, setting aside a few peculiarities in the language of the Lacedæmonians, these dialects were the same; as indeed is shown by Rulandus in his treatise *De Lingua Græca ejusquè Dialectis.*

Besides the authors already mentioned as having written in the Doric dialect, we might add Archytas of Tarentum, Bion, Callinus, Simonides, Bacchylides, Cypselas, Alcmæon, and Sophron.

Most of the medals of the cities of Græcia Magna and Sicily savour of the Doric dialect in their inscription: thus, ΑΜΒΡΑΚΙΩΤΑΝ, ΑΠΟΛΛΩΝΙΑΤΑΝ, ΑΧΕΟΡΟΝΤΑΝ, ΑΧΥΡΙΤΑΝ, ΗΡΑΧΛΕΩΤΑΝ, ΤΡΑΧΙΝΙΩΝ, ΘΕΡΜΙΤΑΝ, ΚΑΥΛΟΝΙΑΤΑΝ, ΚΟΠΙΑΤΑΝ, ΤΑΥΡΟΜΕΝΙΤΑΝ. These names indicate the countries in which the Doric dialect was used.

The general rules of this dialect are laid down by the grammarians of the Port-Royal; but they are much better explained in the fourth book of Rulandus, where he even notes the minuter differences of the dialects of Sicily, Crete, Tarentum, Rhodes, Lacedæmon, Laconia, Macedonia, and Thessaly. The omega abounds everywhere in the Doric; but this dialect bears so close a conformity to the Æolic, that many reckon them but one. (See Müller's *History and Antiquities of the Doric Race*, vol. ii., Appendix.)

Doric *Mode*, in *Music*. See Dorian Mode.

DORING, or Daring, among sportsmen, a method of taking larks, by means of a clapnet and a looking-glass. For this purpose there must be provided several pieces of looking-glass, which are to be so fixed in a frame as to reflect their light upwards; and this apparatus is supported on a moveable pin, with the end of a long line fixed to it, and so arranged that by pulling one end of the cord the apparatus is made to rotate. Several larks, termed *calls*, are provided; and these, with the glittering of the looking-glasses as they twirl round in the sun, invite the other larks down. The card which communicates with the net is then to be drawn, in order to bring the net over the birds so attracted to the spot. The places best adapted for daring larks are open fields remote from any trees and hedges, except one for the concealment of the fowler.

DORIS, the smallest state of ancient Greece, was bounded north by Thessaly and Locris, east by Phocis, south by the Locri Ozolæ, and west by Ætolia. The country itself, which is very limited in extent, is surrounded on every side by spurs of the mountain ranges of Œta and Parnassus, and intersected by the river Pindus (now the *Apostolia*), a tributary of the Cephissus. The cities of the Doric tetrapolis, which were all situated in the vale of this river, were Boium, Cytinium, Erineus, and Pindus.

The original name of Doris is said to have been Dryopis—so named from its inhabitants the Dryopes, who were expelled from the country when the Dorians took possession of it. In addition to the small territory to which they gave name, these Dorian adventurers are said to have occupied a great tract of the adjoining country: a supposition all the more probable as it is nearly incredible that Doris Proper should have maintained a population capable of subduing the Peloponnese. An account of this expedition will be found under the head Dorians. The most powerful state which owed its origin to this expedition was Sparta, which in after times acknowledged her Doric descent by assisting Doris when hard pressed by her more powerful neighbours. Besides Laconia, however, all the other states of the Peloponnese, except Elis and Arcadia, and a few detached spots of small importance, were equally proud of tracing their origin to the Dorian invaders. From the Peloponnese the Dorians spread in all directions. Corinth. Corcyra, Syracuse, Gela, Agrigentum, Selinus, and Tarentum were all colonized by them; and all retained, with certain modifications, the constitution of the parent state. These colonies all subsequently attained so great importance as completely to eclipse the parent state, which in the historical times of Greece is seldom mentioned. In the second Persian invasion it submitted to Xerxes and his hosts, and its towns were therefore spared. In the wars which subsequently harassed Greece it suffered so severely, that it was matter of wonder that any of its cities maintained their very existence.

DORKING, a market-town in the county of Surrey, 21 miles S.S.W. of London. It occupies the side of a sandstone hill, in a picturesque valley, and is a neat and clean town, with wide and well-paved streets. The parish church, recently rebuilt, is a spacious structure, surmounted by a spire. The surrounding country is well wooded and remarkable for its beauty, having numerous fine seats, including Deepdene, the residence of the late Mr Hope, author of Anastasius, and the Rookery, where Malthus was born. A considerable trade is carried on in lime and chalk from adjacent pits. Market-day Thursday. Dorking is famous for its breed of fowls, which have five claws on each foot. Pop. (1851) 3490.

DORMANT, in *Heraldry*, denotes the posture of a lion, or other beast, lying in a sleeping attitude, with the head on the fore paws; by which it is distinguished from the *couchant*, where the beast, though lying, has its head elevated.

DORMER Window, in *Architecture*, a window standing vertically on the sloping roof of a house.

DORMITORY, a gallery in convents divided into several cells, in which the inmates sleep; and hence also applied to the sleeping apartments in other great establishments.

DORMOUSE. See *Myoxis* in index to Mammalia.

DORNBIRN, a market-town of the circle of Bregentz, and Austrian province of Tyrol. It stands on the river Fussach, and is a flourishing place, owing to its manufactories of muslins and cotton cambrics, and its mills for spinning flax. Pop. 4600.

DORNOCH, a parliamentary borough of Scotland, and capital of the county of Sutherland, is situated on the N.E. of the Firth of the same name, 14 miles N. of Cromarty. It unites with Dingwall, &c., in sending a member to parliament. Pop. (1851) 599. Dornoch was formerly the principal seat of the Bishop of Sutherland and Caithness, and was made a royal burgh by Charles I. in 1628. The cathedral, now the parish church, was built about the middle of the thirteenth century, and has recently been restored by the late Duchess of Sutherland. The palace or castle was a large building of most massive structure, of which only the picturesque western tower now remains. On its site a handsome new prison and court-house have recently been erected.

Dornoch *Firth*, an arm of the sea on the E. coast of Scotland, serving as the boundary between the counties of Ross and Sutherland. It is about 15 miles broad at its mouth, and here has more the character of a bay than of a firth. It gradually becomes narrower, till, about three miles west from the town of Dornoch, its breadth decreases to two miles. Above this point it becomes much broader, forming an inner harbour or bay.

DORPAT, or Derpt, a town of Russia, in the government of Livonia, and capital of a circle of the same name, on the Embach, here crossed by a handsome stone bridge of three arches; and also on the road between Riga and St Petersburg, 140 miles N.E. of the former, and 170 S.W. of the latter. Pop. (1851) 12,683. This town is neat, clean, and well-built, the streets are wide and regular, and the houses generally of one story, built of brick, or wood painted in showy colours. It consists of the town proper, and the suburbs of Riga and St Petersburg. The old fortifications have been converted into gardens and public walks. The cathedral is now in ruins, having, with the entire town, been destroyed by a great fire in 1775. Dorpat is the seat of a university originally founded by Gustavus Adolphus in 1632, when Livonia belonged to the Swedish crown. After undergoing numerous vicissitudes during the wars between Russia and Sweden, and having been removed to Pernau, it was re-established here in 1802 by the Emperor Alexander. It has faculties of theology, law, medicine, and philosophy; a library of upwards of 60,000 volumes; a noble observatory, botanical garden, and extensive collections in mineralogy, zoology, anatomy, pathology, &c. In 1852 it was attended by 607 students. Dorpat has also a veterinary school with 37 pupils, a gymnasium, normal school, &c. Lat. 58. 22. 44. N.; Long. 26. 42. 19. E.

DOROGOBUSH, a town of Russia, capital of a cognominal circle in the government of Smolensk, and 46 miles E.N.E. of the town of that name. It is situated on the left bank of the Dnieper, is surrounded by walls, and had 5677 inhabitants in 1850. On 12th October 1812 the French were defeated here by the Russians.

DORSETSHIRE, an English county, situated on the south-western coast. In British times, and previous to the landing of Cæsar, it was inhabited by the Durotriges and Morini, two appellations derived from the British language, and signifying dwellers on the coasts of the ocean. Under the Romans this county constituted a portion of *Britannia Prima;* and the Saxons called it Dorsetta (a word having

the same meaning as the above British appellation), and included it in the kingdom of Wessex. Kingston Hall and Corfe Castle are mentioned as royal residences.

On the north Dorsetshire is bounded by Somersetshire and Wiltshire, on the east by Hampshire, on the west by Devonshire and a part of Somersetshire, while the British Channel bounds it on the south. Its form is very irregular: the northern boundary has a considerable angular projection in the middle; the southern coast runs out in various points and headlands; and the western coast inclines towards Devonshire, with an irregular line. Its greatest length from north to south is about 35 miles, and its breadth from east to west 55. Its circumference, including about 632,025 acres, is nearly 160 miles. In 1851 the population was found to be 184,207; being an increase of 61 per cent. in fifty years. The number of inhabitants to a square mile was 186; to a house 5·1. The total number of houses was 37,940; 36,138 being inhabited, 1587 uninhabited, and 215 in the course of erection.

Dorsetshire is divided into thirty-four hundreds, containing more than 390 parishes, nine boroughs, twenty-two liberties, and nineteen market-towns, the principal of which are Dorchester, Bridport, Sherborne, Lyme-Regis, Shaftesbury, Wareham, Weymouth, Melcombe-Regis, Poole, and Blandford. Only thirteen members are returned to parliament, instead of twenty as formerly. The county itself sends three; Dorchester, Bridport, and Poole, two each; Melcombe-Regis and Weymouth two between them; and Lyme-Regis, Shaftesbury, and Wareham, one each. Dorsetshire forms part of the see of Bristol. Its bishop was established at Sherborne by Henry VIII., but was shortly added to the diocese of Bristol. In remote times it had been a part of the sees of Oxford, of Salisbury, and of Winchester successively.

The surface of Dorsetshire is hilly and uneven. A great portion of the county has the appearance of downs, open and uninclosed pasture land covered with sheep, the stock of which averages from 600,000 to 700,000. More sheep are pastured in the neighbourhood of Dorchester than in any other district, though great numbers of both sheep and oxen are fed in the valley of Blackmore, which is celebrated as rich pasture land, and comprises upwards of 170,000 acres. There are also in this district several orchards, producing excellent cider. On the south-western side there are many vales of great luxuriance; but on the south-eastern there is much waste land, dreary and barren, hardly supporting, even in the summer months, a few sheep and cattle, and supplying the neighbouring villages with heath for fuel. Even in this region, however, cultivation is advancing, and detached portions are improved. The turnpike-roads in this county are numerous, rendering travelling easy and agreeable.

The downs are principally of a light chalky soil, with a turf remarkably fine, producing hay, in the inclosed parts, of an excellent quality, on which beasts will thrive well in winter without any other food. About Bridport the lower lands are mostly a deep rich loam; but on the hills, throughout the western district, the soil is a sandy loam, intermixed with flint, well adapted for the growth of beech. To the north of Sherborne, where is some of the best land in the county for the plough, it is a stone *brack*, which is the case in the Isle of Portland and the Isle of Purbeck. In the centre of the county the soil is good and the land well managed. About a third of the soil is chalk, a fifth clay, a sixth sand, a ninth waste, and the remainder gravel, loam, &c.

Dorsetshire is not a well-wooded county; and, in general, native timber is scarce and dear. In some local spots, where the land is cold and wet, such as Duncliff in the vale of Blackmore, Heycombe Wood in the vale of Sherborne, and others of a similar nature, some plantations may be seen.

The air of Dorsetshire is remarkably mild and salubrious; which, added to the beauty of its scenery, has obtained for it the appellation of the Garden of England. Weymouth has long been celebrated as a fashionable watering-place; and, owing to the general calmness of the sea there, its pleasant situation, and its commodiousness for bathing, it has risen to great consequence.

The chief port in the county is Poole, situated on an estuary formed by the mouth of the Frome. Its entrance is defended by Brownsea Castle, and it is very secure in all winds. It is the chief place for equipping ships for the Newfoundland fishery; and considerable trade is carried on from it with Spain, Portugal, and the Mediterranean. Swanage, Weymouth, Bridport, and Lyme, have harbours capable of admitting small vessels only.

The rivers of Dorsetshire are the Frome, the Stour, the Piddle, and the Ivel. The Frome rises in the north-western part of the county, near Evershot; and, passing by Dorchester, reaches Poole, and falls into its bay. The Stour enters this county from Wiltshire, near Gillingham, and, pursuing a southern and south-eastern direction, enters Hampshire. The Piddle rises in the north, and, flowing to the south-east, falls into Poole Bay. The Ivel, anciently the Yoo, has its origin from several springs near Horethorn, in a hill north-east from Sherborne, from which town it flows into Somersetshire, and falls into the Parret.

Although neither coal nor any metallic ores have ever been found in Dorsetshire, the stone quarries of Purbeck and Portland have long been celebrated. Purbeck, though called an island, is more properly a peninsula, of an irregular oval form, about twelve miles in length and seven in breadth. It consists, according to Mantell, of cretaceous, wealden, and oolitic strata, in their regular order of succession, and highly inclined in their section toward Swanage Bay, where they are easily detected. At Handfast Point the chalk is discovered, its lower division dipping at a considerable angle; then comes a layer of firestone, next galt, and then greensand—all inclined; then, at Swanage Bay, a thick wealden bed; to the south of which are the Purbeck Hills, with their peculiar strata; and, a little further on, the Portland oolite. The soil is altogether calcareous, and for the most part a continued mass, either of white or a brownish limestone, the latter having a mixture of sea-shells. The quarries on the south side of the isle afford an inexhaustible fund of natural curiosities. The best quarries are at Kingston, Worth, Langton, and Swanwick. The Swanwick stone is white, full of shells, takes a polish, and looks like alabaster. About Wareham and Morden is found a stone of an iron colour, called firestone. Near Dunshay, marble of various colours, blue, red, gray, and spotted, is dug up; but all of a coarse grain. Much of the stone of this district was used in the building of St Paul's Cathedral, Westminster Bridge, and Ramsgate Pier, and may be discovered in many of our ancient cathedrals, churches, gravestones, and monuments. One of the most valuable products of Purbeck is a white clay used for making pipes, and very extensively applied to the manufacture of china. Large quantities of it are dug, and many vessels loaded with it for Staffordshire, at Russell Quay, within the port of Poole.

The cliffs in the Isle of Portland rise frequently to 100 or 150 feet in height, and large masses lie scattered on the shore. These are composed of calcareous grit, containing moulds or forms of various shells, and emitting, when rubbed with steel, a bituminous smell. The grit is cemented together by a calcareous paste. The quarries are scattered among these rocks, more or less, in every part of the isle; but those of most repute are at Kingston. At this place there is a pier, whence upwards of 6000 tons of stone, on an average, are supposed to be shipped off annually. The first stratum in these quarries is about one foot of blackish or reddish earth; then six feet of stone, not fit for exportation. Below this is the bed of good stone, ten or twelve feet

deep, and beneath it chert or clay. The stratum of stone that is worked for sale lies nearly parallel with the upper surface of the island, and without much earth or rubbish on it. When the beds are cleared, the quarrymen proceed to cross-cut the large flats, which is done with wedges. The beds being cut into distinct lumps, are squared by the hammer to the largest size which it will admit; and blocks are thus formed from half a ton to six or eight tons weight. The colour of the Portland stone (or freestone as it is sometimes called, from the freedom with which it may be broken into any shape), is well known as almost white, and as composing the materials of the most splendid erections in London, as well as in other parts of the British empire.

The general practice and management of tillage in this country is less attended to than any part of agriculture; for it appears to be the plan of the farmers to put the seed into the ground with as few ploughings as possible. The sowing of wheat is often effected with one ploughing; and symmetry and neatness are not much regarded. The plough used is called a *sull*, and is long, large, and heavy, with one small wheel at the side of the beam, and is worked by four horses or six oxen, two abreast. In the neighbourhood of the towns, land lets for from forty to fifty shillings the acre; and, in general, arable land from twenty to thirty.

Barley is found to make the best returns, yielding about 30 bushels to the acre. Flax and hemp are objects of great importance about Bridport, Bradford, and Beaminster. The flax seed is imported from Riga, and the average crop is from fifty to sixty dozen pounds per acre, worth from four shillings and sixpence to seven shillings per dozen. It is a precarious crop, depending very much on the season; and hence the quantity cultivated has of late years been gradually diminished. The farms are mostly large. Leases generally run from 10 to 20 years. Agriculture is certainly backward in the county, but it is improving.

The sheep of Dorsetshire have long been celebrated. They are horned, white faced, with long small white legs, the carcass rather long and thin, the mutton fine-grained and of good flavour, weighing per quarter, in wethers at three years and a half old, from sixteen to twenty pounds. Their wool is fine and short; and the breed has the peculiar property of producing lambs at any period. There is a small breed in Portland and Purbeck, the quarter of which weighs about eight pounds.

Many fine Devonshire oxen are fattened for the market in Dorsetshire. In the hilly districts a hardy race of half long-horned cattle, with brindled sides, and white on the underparts, exists. Great quantities of butter are sent to the London market. The skimmed-milk cheese is much esteemed, though very little of it is exported.

Vast numbers of mackerel are taken near Abbotsbury, and along the shore from Portland to Bridport. The season for taking them is from the middle of March till midsummer, in nets or seines. Herrings and other fish common in these seas are also taken in abundance.

The manufactures of Dorsetshire are not extensive. The principal are those of flax and hemp, in the neighbourhood of Bridport and Beaminster, and also on a smaller scale in the Isle of Purbeck; of all sorts of buttons, chiefly at Blandford, and to a smaller extent at Shaftesbury; and of a sort of flannel or coarse woollen cloth, called swanskin, at Sherminster. At Stalbridge is a manufacture for spinning silk, and at Sherborne is another upon a larger scale. Some worsted stockings are made at Wimborne.

On the extended downs in the neighbourhood of Dorchester several tumuli are thrown up in all directions, proving this town to have been an important place in British times. Maiden Castle, situated on the apex of a hill about one mile south of the town, is undoubtedly the remains of an original British fortress. Nearly two miles N.W. of Kingston Hall, in the parish of Chapwicke, is a large British encampment called Bradbury Rings, which occupies the summit of a considerable eminence. This camp is of a circular form, with treble ramparts and ditches, having two entrances, one on the N.E. and another on the western side. The circumference of the outer rampart is nearly a mile. In the parish of Lullworth is another British fortification, consisting of three ramparts and ditches, including an area of about five acres. It is generally called Flowers' Barrow, from the prevalence of these ancient sepulchres within its compass. Many of these barrows have been opened, and found to contain burnt bones, corroded metal, and remains of ancient warlike instruments. A barrow was opened some years ago at Stowborough, in which a body was discovered in an excavated oak trunk, wrapped in folds of skin. Between three and four miles from Corfe Castle eastward is Nine Barrow Down, an eminence which derives its name from the nine large barrows situated on it in a line. About a mile from Winterbourn Abbas is a small circle of stones, the diameter of whose area is twenty-eight feet; and the adjacent downs are much fuller of Celtic barrows than even Salisbury plains. There is an endless field in many parts of the country for those fond of British antiquities.

The *Via Iceniana*, or Icennine Way, enters the county near Woodyates; and, passing through Dorchester, takes its course to Seaton in Devonshire. There are several smaller ways proceeding from Dorchester, Wimborne-Minster, and some other places in the county. The Roman stations in Dorsetshire appear, from the best authorities, to have been *Londinis*, now Lyme-Regis; *Canca-Arixa*, Charmouth; *Durnovaria*, Dorchester; *Vindogladia*, Winborne; *Clavinio*, Weymouth; *Morinio*, Wareham; and *Bolclannio*, Poole. Near Dorchester are the remains of a Roman amphitheatre, which is computed to have held nearly 13,000 spectators. A large circular entrenchment may be traced upon Woodbury Hill, supposed to have been the *Castra Stativa* of the Romans. On Hambledon Hill is another encampment; and also the remains of what has been thought to be a labyrinth. In the parish of Rampisham a beautiful tessellated pavement, about fourteen feet by ten, was discovered in 1799; and in the vale between Maiden-Newton and Frampton, at the distance of 150 yards from the river Frome, another of much larger dimensions was found in 1794. At Sturminster-Newton are the ruins of a castle, in the form of the letter D.

The remains of ancient castles are numerous in Dorsetshire. The principal are, Corfe, whose ruins are large, and allowed to be among the noblest and grandest in the kingdom; Abbotsbury, a little north of East Bexington; Brownsea Castle, in the island of the same name; and Portland Castle.

The abbeys whose ruins may yet be discovered, are those of the monastery of Benedictines at Cranborne, a part of which now forms the parish church, one of the oldest in the county; Cerne Abbey, said to be founded by St Augustin, the remains of which though not extensive are interesting; Abbey Milton, whose church is now converted into a private chapel; and the monastery of Shaftesbury, the ruins of which are discernible near the mansion of Sir Thomas Arundel. Some parts of the cloister and domestic buildings of the Abbey of Sherborne are now occupied by silk machinery; besides inconsiderable remains of several more.

The church of Fordington is partly in the Saxon style; that of Corfe is Gothic. The churches of Dorchester, Sherborne, Millbourne, St Andrew, Rapisham, Weymouth, and Shaftesbury, are all venerable buildings; but Dorsetshire cannot boast of many ancient ecclesiastical structures.

Amongst the modern erections of this county should be mentioned the new jail of the county town. It was built according to Howard's plan, under the direction of Bradburn the architect. In its external appearance it is peculiarly handsome and characteristic; and the interior possesses every convenience appropriate to its purpose.

This county affords the following titles to different noble families: Duke of Dorset, to the family of Sackville; Duke of Portland, to that of Bentinck; Earl of Dorchester, to that of Carleton; Earl of Sherborne, to that of Dutton; Earl of Shaftesbury, to that of Ashley Cooper; Earl of Digby, to that of Digby; and Viscount Bridport, to that of Hood.

Bishop Stillingfleet was born at Cranborne; Prior the poet at Wimborne; and Hussey, the artist, who drew by the proportions of the musical scales, at Marnhull, in Dorsetshire.

Places of worship belonging to Church of England 304, sittings 94,097; day schools 664, day scholars 25,004; Sunday schools 386, Sunday scholars 27,676.

DORSAL (Lat. *dorsum*, the back), pertaining to the back; as the *dorsal fin* of a fish, &c.

DORSIFEROUS, in *Botany*, bearing seeds on the back of the leaves, as the ferns.

DORT or DORDRECHT, an important commercial city of Holland, capital of a cognominal district in the province of South Holland, 10 miles S.E. of Rotterdam. It is situated on an island of the Meuse, said to have been separated from the mainland in 1421, by an inundation which swept away 72 villages, and about 100,000 inhabitants. This is one of the oldest cities of Holland, but the period of its rise is uncertain. It was surrounded by walls in 1231 by Florent IV. Count of Holland, who made it his residence, and granted it many important privileges. In 1457, almost the entire town, including the church of Notre Dame, founded in 1366, and other public buildings, was destroyed by fire. It was one of the first towns to embrace the Reformed religion, and to throw off the yoke of the Spanish king. In 1572 a meeting of deputies was held here when the independence of the United Provinces was first declared: and in 1618 and 1619 sat the celebrated synod of Dort. The town-hall is a handsome building; and the principal church is an old Gothic structure 300 feet long by 125 wide, with a heavy square tower, and numerous monumental stones, some of great antiquity. The hall in which the synod was held is now a public house. The houses are generally of an antique fashion, with the gables turned outwards, and many of them date from the period of the Spanish occupation. Dort possesses a good harbour, from which two canals lead to the centre of the town, and thus facilitate the conveyance of goods to the warehouses. It carries on an extensive trade in corn, flax, salt fish, train oil, and timber, brought down the Rhine; and has shipbuilding docks, saw-mills, sugar and salt refineries, tobacco factories, linen bleaching, and white-lead works. Dort is the birthplace of the brothers De Witt. Pop. (1850) 20,878.

DORTMUND, a walled town in the Prussian province of Westphalia, capital of a cognominal circle, in the government of Arnsberg. It is situated in a fertile district on the Emscher, and on the Minden and Dusseldorf railway, 29 miles W.N.W. of Arnsberg. Pop. (1849) 10,532. It is the seat of a superior mining board, and has manufactures of woollens, linens, velvets, tobacco, nails, and cutlery, and some trade.

DORYPHORI (δόρυ, *spear*, and φέρω, *I bear*), in *Antiquity*, the body-guard of kings and tyrants, of which the spear was the characteristic weapon. In imitation of the Greeks, the Roman emperors had similar body guards. The Prætorian bands likewise were thus designated.

DOSITHEANS (*Dosithei*), an ancient sect among the Samaritans in the first century of the Christian era. On the subject of the Dositheans, see Archbishop Usher.

DOSSER (Fr. *dos*, the back, or *dossier*, a bundle), a pannier or basket to be borne on the shoulders of men; sometimes used in fortification for carrying earth.

DOSSIL, in *Surgery*, a pledget of lint made into a cylindric form.

DOTIS or TATA, a town of Hungary, county of Komorn, and 12 miles S.E. of the town of that name. It consists of the Upper and the Lake town, the latter so called from a small lake in its vicinity. In the neighbourhood are several mineral springs, and stone and marble quarries. Pop. about 8000.

DOTTARD, a tree kept low by cutting; a pollard.

DOUAI, or DOUAY, an ancient and strongly fortified town of France, capital of a cognominal arrondissement in the department of Nord, situated on the Scarpe, 18 miles south of Lille, with which, as well as with many other large towns both in France and Belgium, it is connected by railway. Old walls flanked with towers surround the town, which is farther defended by a detached fort on the left bank of the river, about 2 miles distant. Douai contains numerous literary and scientific institutions, including a university; academy; royal college; college for the education of English Roman Catholic priests, founded by Cardinal Allen; a royal school of artillery; school of drawing and music; museum of natural history; collection of paintings; botanic garden; and a public library, with about 30,000 volumes. It was formerly the seat of a university, founded in 1562. It contains also one of the three royal cannon foundries of the kingdom, an arsenal, and large establishments of artillery; and is the seat of royal court for the departments of Nord and Pas-de-Calais. Its railways and canals open up to Douai an extensive trade in corn, wine, brandy, cattle, wool, hops, flax, and its manufactured produce, chiefly lace, gauze, cottons, linens, thread, earthenware, glass, soap, sugar, salt, and paper. According to some, Douai existed in the time of the Romans; but this seems to be very doubtful. It, however, rose to considerable importance under the Counts of Flanders, and passed with that country into the hands of the king of Spain. In 1667 Louis XIV. took possession of Douai. In 1710 it was taken by the allies under Marlborough and Eugene, but was retaken by the French the following year. Douai gives name to an edition of the Holy Scriptures with copious notes by Roman Catholic divines, prepared for the use of the members of that communion. Pop. (1851) 18,013.

DOUBLE-BASS. See MUSIC, § *Musical Instruments*.

DOUBLET, among lapidaries, a counterfeit stone composed of two pieces of crystal, with a colour between them; so that they present the same appearance to the eye as if the whole substance of the crystal were coloured.

The crystal or glass is first cut in the manner of a brilliant, except that the figure must be composed of two separate pieces. After the two plates have been thus cut, and fitted with the utmost exactness, the upper part is to be polished ready for setting. The colour is then put between the two plates by the following method:—To two scruples of Venice turpentine add one scruple of the grains of very pure mastich previously powdered; melt them together in a small silver spoon, add to them gradually any of the coloured substances mentioned below, in a state of fine powder, and stir them well together as the colour is put in. Then warm the doublets to the same temperature as the melted mixture, apply it to the surface of the lower plate; and put the upper one instantly upon it, and press them to each other, taking care that they be conjoined perfectly even. When the cement is quite set, the redundant part of it, which has been pressed out of the joint, should be scraped off. In the setting, the mounting should cover the joint, in order to prevent the separation of the pieces.

The colour of the ruby may be imitated by mixing a fourth part of carmine with some of the finest crimson lake; the sapphire, by very bright Prussian blue, mixed with a minute portion of crimson lake; the emerald, by distilled verdigris, to which is added a little powdered aloes; the garnet, by dragon's blood, with the addition, if necessary, of a very small quantity of carmine; the amethyst, by mixing some Prussian blue with crimson lake; the yellow

topazes, by mixing powdered aloes with a little dragon's blood, or by good Spanish arnotto; the chrysolite, hyacinth, vinegar garnet, aqua-marine, and such other weaker or diluted colours, may be formed in the same manner, by lessening the proportions of the colours, or by compounding them together so as to correspond with the hue of the stone to be imitated.

DOUBLETS, a game on dice within tables. The men, fifteen in number, are placed thus:—Upon the six, cinque, and quatre points, there stand three men a-piece; and upon the trey, deuce, and ace, only two. He who throws highest has the benefit of throwing first, and what he throws he lays down, and so does the other: what the one throws and has not, the other lays down for him, but on his own account; and thus they proceed until all the men are down, and then they "bear," as it is called. He who is first down bears first, and will doubtless win the game if the other throws not doublets to overtake him; which he is sure to do, since he advances or bears as many as the doublets make, namely, eight for two fours.

DOUBLING, in the military art, the putting of two ranks or files of soldiers into one. Thus, when the word of command is *double your ranks*, the second, fourth, and sixth ranks march into the first, third, and fifth, so that the six ranks are reduced to three, and the intervals between the ranks become double what they were before.

Doubling, in *Navigation*, the act of sailing round or passing beyond a cape or promontory.

DOUBLOON, or Doblon, a Spanish and Portuguese coin, being the double of a pistole.

DOUBS, one of the eastern frontier departments of France, bounded on the E. by Switzerland, from which it is separated partly by the Jura chain of mountains, and partly by the river Doubs, and on the N., W., and S. by the departments of Upper Rhine, Upper Saône, and Jura. It is formed of part of the ancient province of Franche-Comté, and the ancient German principality of Montbéliard. Four parallel chains of the Jura mountains traverse it from N.E. to S.W. In the highest and most eastern of these, the principal summit, Mont Luchet, attains a height of 5283 feet; but in the most western the highest points do not exceed 1000 feet. These chains are all of calcareous formation, and present numerous rocky crags, grottoes, caverns, and other natural curiosities. The river Doubs, which gives name to the department, rises at the foot of Mount Rixon, in the arrondissement of Pontarlier, and, after twice traversing this department through its entire length, passes through the department of Jura, enters that of Saône-et-Loire, and joins the Saône. It has an entire course of about 250 miles, 195 of which are in this department. Near Morteau it forms a magnificent cataract, having a perpendicular fall of 88 feet. From Besançon to near Montbéliard it forms part of the navigable canal between the Rhine and the Rhone. Doubs is abundantly watered by numerous smaller rivers and rivulets. The differences in its elevation give it a very variable climate, but the general character is cold, with long and severe winters. The prevailing winds are the north-east and south-west. The surface may be divided into three distinct regions. The highest region, on which the snow usually lies for six months in the year, is mostly covered with vast forests of fir trees, and affords good pasturage to numerous herds of cattle. The second or less elevated region is chiefly occupied by forests of oak, beech, sycamore, the walnut-tree, &c., and the intervening valleys are susceptible of cultivation. The plain region is the most fertile, producing wheat, rye, maize, hemp, pulse, fruits, and wines. Of its entire area of 525,212 hectares (2020 square miles), 191,577 hectares are arable; 120,646 in wood; 101,688 in heath and pasture; 79,892 in meadow; and 8011 in vineyards. Agriculture is in a very backward state—cattle-rearing and dairy produce, particularly cheese, receiving a great share of attention. It has numerous iron foundries; manufactures of cotton and woollen cloths, hardware, cutlery, watches, paper, glass, leather; and a considerable trade in cattle, hides, timber, and dairy produce. There are also mines of iron, coal, and lignite; and quarries of gypsum, marble, building stone, &c. It is divided into four arrondissements, which, with their subdivisions and population, are as follows:

Arrondissements.	Cantons.	Communes.	Pop. 1851.
Besançon,............	8	203	110,826
Pontarlier, ...	5	89	52,195
Baume,...............	7	187	68,354
Montbéliard,.........	7	161	65,304
	27	640	296,679

The capital is Besançon.

DOUCHE (French), a jet of water directed upon some part of the body, as a cure for local weakness, rheumatism, &c.

DOUGLAS, Gavin, bishop of Dunkeld, was the third son of Archibald earl of Angus, and of Elizabeth the daughter of Robert Lord Boyd, who for some time filled the office of high chamberlain. He appears to have been born in 1474, or the ensuing year. With the place of his birth or education we are not acquainted, but we may suppose his course of study to have been suitable to his profession. Having entered into holy orders, he was collated to the rectory of Hawick;[1] and as the dormant energies of the human mind are awakened by external objects, his early residence amid the fine pastoral scenery of Teviotdale may have had a strong tendency to cherish in his imagination the seeds of genuine poetry. In the year 1509, we find him described as provost of the collegiate church of St Giles in Edinburgh.[2] This preferment was in the gift of the crown: it placed him in a situation of no small dignity and emolument, and he appears to have held it with his other benefice. It was while he occupied these less elevated stations that he composed the very ingenious works which have rendered his name so conspicuous in the literary annals of his country.

His father, who is sometimes denominated the great earl of Angus, and sometimes *Bell-the-cat*, followed the standard of James the Fourth when he invaded England; but finding his prudent counsels disregarded, he excused himself on account of his advanced age, and withdrew from the army. His two eldest sons, George and William, together with about two hundred gentlemen of the name of Douglas, perished in the fatal battle of Flodden-field. This calamity to the nation in general, and to his own family in particular, made so deep an impression on his heart, that having retired to St Mains, a religious house in Galloway, he died there within the space of twelve months.[3] His title and estates descended to his grandson Archibald, a young nobleman whose personal attractions were so unrivalled that he speedily obtained the tender regard of the widowed queen, and their nuptials were solemnized before she had completed the year of mourning. This precipitate match, which had been concluded without the concurrence of the principal nobility, excited general indignation: the queen was no longer willingly acknowledged as regent; the pre-eminence of her husband rendered him odious in the eyes of the more powerful subjects; and the house of Douglas was involved in persecutions which this resentful spirit of jealousy excited.

[2] Keith's Catalogue of the Scottish Bishops, p. 93.
[3] Hume's History of the Houses of Douglas and Angus, p. 235. Edinb. 1644, fol.

Among those who perished at Flodden were the archbishop of St Andrews, the bishop of the Isles, the abbot of Kilwinning, the abbot of Inchaffray, and other warlike sons of the church. The archbishop of St Andrews, Alexander Stewart, who was the king's natural son, and a young man of very promising talents, had likewise held the abbacies of Aberbrothock and Dunfermline, together with the priory of Coldingham. In a letter addressed to Pope Leo the Tenth, the queen, after extolling Gavin Douglas as second to none in learning and virtue, earnestly requested that he might be secured in the possession of the abbacy of Aberbrothock, till his singular merit should be rewarded by some more ample preferment.[1] After the death of the late primate, William Elphinstone, bishop of Aberdeen, had been nominated to the vacant see; but his modesty or infirmities induced him to decline this splendid offer, and the queen afterwards attempted to elevate Douglas to the primacy. Confiding in the royal nomination, and in the influence of his own family, he took possession of the archiepiscopal palace; but his claims were disputed by two powerful rivals, John Hepburn, prior of St Andrews, and Andrew Foreman, bishop of Moray in Scotland, and archbishop of Bourges in France. Hepburn having prevailed upon the canons to elect him to the see, laid siege to the castle, and after meeting with some resistance, expelled the retainers of his competitor; nor did the earl of Angus, with a party of two hundred horse, succeed in his attempt to recover the possession of this strong hold.[2] In the mean time, Foreman, who was a person of great influence, found means to obtain from Rome a grant of the archbishopric of St Andrews, and the other preferments which had been held by the late primate.[3] Douglas, actuated by a decent spirit of moderation, resolved to abandon the pursuit of this high object of ecclesiastical ambition; but the other competitors seem to have been alike insensible to motives of private virtue and of public decorum. Foreman being afraid to publish the papal bulls, prevailed upon Lord Hume, by bestowing on his brother the priory of Coldingham, to undertake the support of his cause; and this border chieftain enabled him to appear at Edinburgh, attended by ten thousand men in arms. Having performed the necessary ceremony, they hastened to St Andrews in order to complete their pious task, but they found the prior sufficiently prepared for their reception: in the castle and in the cathedral he had placed so considerable a garrison, that Foreman was unwilling to hazard an attack, and deemed it more prudent to adjust their claims by an amicable negociation; it was finally stipulated that he should be put in quiet possession of the primacy, that Hepburn should receive a yearly pension from the bishopric of Moray, and should retain such rents as he had already levied from the archbishopric of St Andrews.[4]

From this negociation Douglas derived no advantage; and, to complete the measure of his disappointments, the abbacy of Aberbrothock, which he had regarded as secure, was transferred to James Beaton, archbishop of Glasgow, and chancellor of the kingdom. The death of George Brown, bishop of Dunkeld, which occurred in the month of January 1515, presented him with new prospects, and exposed him to new mortifications. The queen nominated him to the vacant see, and, as is supposed, by the intervention of her brother the king of England, obtained a papal bull in his favour. But, in the mean time, the earl of Athole had induced the chapter to postulate his brother Andrew Stewart, prebendary of Craig, who had not yet taken subdeacon's orders.[5] The enemies of the queen did not neglect this opportunity of disgracing an individual so nearly allied to her husband: Douglas was cited before the competent judges, and was accused of having violated the laws, by procuring bulls from Rome. Such practices had indeed been prohibited by several statutes, but these had very seldom been enforced. Of this offence he was however convicted; and being committed to the charge of his former rival Hepburn, he was successively confined in the castles of Edinburgh, St Andrews, and Dunbar, and again in that of Edinburgh. Before the period of his trial, the queen's party had almost entirely lost its influence: the duke of Albany, who was the grandson of James the Second, and the cousin of the late king, arrived from France on the 10th of May, and within the space of about two months was declared regent of the kingdom. A compromise at length took place between the two parties: Douglas obtained his liberty after an imprisonment of more than twelve months; and his claim to the bishopric was secured by Beaton's mediation with the new regent. He was consecrated at Glasgow by the same prelate, who defrayed the expenses attending this ceremony; and having paid a visit to the metropolitan city of St Andrews, he proceeded to Dunkeld, where the clergy and laity testified the utmost joy at the arrival of so noble, learned, and pious a bishop. The bulls having with the usual solemnities been read at the high altar, he retired to the residence of the dean, George Hepburn, by whom he was suitably entertained. The episcopal palace was still occupied by the retainers of Stewart; and the bishop finding next day that they had likewise seized the tower of the cathedral, was obliged to perform divine service at the deanery. In the afternoon he held a consultation with the nobility, gentry, and clergy, by whom he was attended; but their deliberations were speedily interrupted by the intelligence that Stewart had taken up arms, and was advancing to support his adherents; and at the same time they were alarmed by the commencement of a fire from the palace and the cathedral. Lord Ogilvy, with the eldest son of the earl of Crawford, and many other friends, including a considerable number of ecclesiastics, with the dean among the rest, immediately began to prepare for action; and messengers having been dispatched to the neighbouring districts, his party was next day strengthened by the arrival of a formidable reinforcement of armed men. Stewart, who did not find himself strong enough to hazard an attack, retired into the woods. His retainers, who garrisoned the palace and the cathedral, were now summoned to surrender, under the pain of excommunication; and on their refusing to obey this summons, the bishop's servants, led by a valiant prebendary, and by James Carmichael,

[5] It may not be unnecessary to remark, that in the popish church there are seven orders, namely, those of porter, lector, exorcist, acolyte, subdeacon, deacon, and priest; and that no person can regularly be elected a bishop, unless he has at least taken subdeacon's orders. Although he cannot be elected, he may however be postulated by the chapter; and if this postulation is admitted by the pope, he is then considered as elected and confirmed. "Postulatio est ejus, qui eligi non potest, in prælatum concors capituli facta petitio." (Lancelotti Institutiones Juris Canonici, lib. ii. tit. viii.) There are other canonical impediments, which we need not enumerate; for Stewart's disqualification is particularly specified by Myln.

took possession of the cathedral. Intimidated by this event, those who occupied the palace requested that a truce might be granted, and the sentence of excommunication delayed for a few hours; but when the stipulated time had elapsed, they still refused to surrender. The interference of the regent at length enabled Douglas to take possession of his palace without the effusion of blood; a circumstance, as one of his biographers has remarked, which "was certainly very acceptable to the good bishop; who in all the actions of his life discovered a gentle and merciful disposition, regulating the warlike and heroic spirit of his family by the excellent laws of the Christian religion."[1] After these events, Stewart hastened to the court, accompanied by his brother the earl; and Douglas having likewise made his appearance, their respective claims were taken into consideration by the regent and council. It was finally agreed that Stewart should relinquish his pretensions to the see of Dunkeld, but should retain such rents as he had already levied, and should be confirmed in the possession of the two benefices of Alyth and Cargill, under the condition of paying the bishop a certain annual contribution in grain.[2] Although Douglas had so recently been punished for soliciting bulls from Rome, yet the regent did not scruple to apply to the pope for a ratification of this agreement: in a letter dated on the 28th of September 1516, he entreated his holiness that all informalities might be removed, and the stipulations rendered valid by his sanction.[3]

Having at length been installed in his cathedral, he was speedily called from the discharge of his episcopal functions. During the ensuing year, an ambassador arrived from France, with a proposition for the renewal of the ancient league between the two kingdoms; and it was thought expedient that the duke of Albany should himself repair to Paris, accompanied by Bishop Douglas, and by Patrick Panter, chancellor of Dunkeld, and secretary of state. The negociation having been brought to a satisfactory conclusion, the bishop was employed to convey the earliest intelligence to Scotland.[4] His professional duties seem again to have been interrupted during some part of the year 1518: in the British Museum there is an original letter, signed by the earl of Angus and others, and recommending him to the English king as a proper person to transact certain affairs in which they were concerned.[5] Though thus exposed to occasional distractions, he yet presided over his diocese with exemplary piety. The various troubles in which he was formerly involved had not merely prevented him from accumulating riches, but had even encumbered him with debts; yet the benevolence of his disposition prompted him to perform many acts of charity and munificence.[6] The revenues of this see are represented as ample,[7] and he was again so fortunate as to fix his residence in a delightful part of the country: the situation of Dunkeld, which no intelligent lover of our early literature can visit without recollecting the name of Douglas, has a romantic beauty of which it is difficult to convey an adequate idea.

When the duke of Albany was preparing to quit the kingdom, he delegated his authority to the archbishops of St Andrews and Glasgow, and the earls of Arran, Angus, Argyle, and Huntley: but the predominating power of Angus excited the apprehensions or the jealousy of his colleagues; and they resolved to unite their strength with the view of circumscribing the influence of so formidable a rival. On the 29th of April 1520, Arran with many others of the nobility assembled at Edinburgh in the house of Archbishop Beaton: they formed the resolution of instantly seizing the person of Angus, whose power, they pretended, was so exorbitant that, while he continued at liberty, his fellow-subjects could enjoy no security. Aware of their hostile intentions, he requested his uncle the bishop of Dunkeld to mitigate their resentment, and persuade them to adopt a more lawful method of redress. He accordingly addressed himself to the archbishop, whom he found in the church belonging to the monastery of the black friars, and entreated him to act the part of a peacemaker: the crafty and turbulent prelate protested that he was at once ignorant of their designs, and unable to prevent them from being carried into execution; and to confirm this averment, he made a solemn appeal to his conscience, but having too forcibly applied his hand to his breast, he discovered to his indignant companion, that his sacred habit concealed a coat of mail. "My Lord," exclaimed the bishop, "I perceive your conscience is not good, for I hear it *clattering*," that is, telling tales. He next accosted Sir Patrick Hamilton, requesting him to interpose with his brother the earl of Arran: this gentleman was inclined to peaceable measures, when the earl's natural son Sir James, a man of a ferocious disposition, rudely upbraided him with cowardice. This charge he repelled with indignation; and having drawn his sword, he rushed furiously into the street, where the earl of Angus had stationed a numerous body of his retainers: perceiving him advance before the other assailants, the earl called aloud to his followers to save Sir Patrick Hamilton's life; but in the heat of battle it is difficult to spare those who are eager to destroy, and he was speedily slain, together with the eldest son of the earl of Eglintoun. The encounter, which was long and fierce, was at length decided by the interference of some of the citizens, who were favourably disposed to the queen, and therefore espoused the cause of her husband. Seventy-two of his antagonists perished in the battle. During this scene of disgraceful violence, the bishop of Dunkeld had retired to his chamber, and spent the anxious interval in a manner suitable to the profession; but when the contest was decided, he hastened to prevent the wanton effusion of blood. The archbishop, who appears to have been personally engaged, had taken refuge behind the altar of Black-friars church, and the rocket was already torn from his shoulders, when the interposition of Douglas saved his life.[8]

The duke of Albany, after an absence of upwards of four years, returned to Scotland in 1521; and one of his earliest measures was to reduce the inordinate power of the Douglasses. Angus and his principal adherents, having been summoned to answer for their violent proceedings, fled for refuge to the Kirk of Steill. The bishop of Dunkeld was dispatched to London as their accredited agent,

Hume's Hist. of the Houses of Douglas and Angus, p. 245.—Lindsay refers this event to the year 1515, but other historians, with greater probability, add five years to the number. The encounter was long remembered in Edinburgh by the name of *Cleanse the Causey*.

and was instructed to represent their safety as necessarily connected with that of their young sovereign.[1] At the court of Henry the Eighth, where his poetical talents had probably found many admirers, he experienced a gracious reception; and the king is said to have provided for his maintenance by the grant of a liberal pension.[2] He now contracted a friendship with Polydore Virgil, who was engaged in composing a history of England. The recent publication of Mair's history of Scotland, in which he ventured to expose the Egyptian fables of his predecessors, had excited the indignation of such of his countrymen as delighted to trace their origin to the daughter of Pharaoh. Douglas was studious to warn his Italian friend against the opinions of this worthy doctor of the Sorbonne;[3] and presented him with a brief commentary, in which he pursued the fabulous line of our ancestry from Athens to Scotland; nor was a poet to be easily induced to relinquish so fine a tissue of romantic narrative. This tract, which was probably written in Latin, seems to have shared the common fate of the manuscripts entrusted to Polydore; who, in order to secure the errors of his work from detection, is said to have destroyed many valuable monuments of antiquity.[4] Vossius has stated that Douglas wrote a history of Scotland, consisting of several books;[5] but Bishop Bale, to whose authority he refers, only mentions a single book;[6] and it is evident that the historical work to which both these writers and Dempster[7] allude, is merely the brief commentary quoted by Polydore Virgil.

While the accomplished prelate was thus employed in England, his enemies were not inactive in Scotland. His mission to the English king furnished a sufficient pretext for accusing him of treason: on the 21st of February 1522 he was declared a traitor, and the revenues of his see were placed in a state of sequestration; the king's subjects were prohibited, under the pain of treason, from affording him any pecuniary assistance, or maintaining with him any correspondence either by letters or messages. An account of these proceedings was transmitted to the pope, accompanied with a remonstrance against the nomination or recommendation of the traitor Gavin Douglas to the archbishopric of St Andrews and the abbacy of Dunfermline, or to either of those preferments.[8] The extent of his influence had manifestly excited the alarm of Beaton, who was determined at all hazards to secure these ample prelacies, recently become vacant by the death of Foreman. Nor were these the only expedients to which he resorted: as chancellor of the kingdom, he addressed a letter to the king of Denmark, entreating him to represent Douglas to the sovereign pontiff as a person altogether unworthy of his favour and protection.[9] Beaton became archbishop of St Andrews, and Douglas died in exile. He had been cited to appear at Rome, and, according to his own declaration, he intended to obey the summons;[10] but in the course of the same year, and before he began to decline from the vigour of manhood, he was seized with the plague, and speedily fell a victim to its dreadful contagion.[11] He died at London in 1522, and was interred in the Savoy church, on the left side of Thomas Halsay, bishop of Leighlin in Ireland; whose monument also contained a short inscription of his name and addition.[12] The character which he left behind him was that of a "man learned, wise, and given to all vertue and goodness."[13] With the splendour of his birth and the dignity of his person he united many accomplishments and many virtues. Although he lived in an age of lawless violence, and was connected with a powerful and turbulent family, he was uniformly distinguished by the moderation of his conduct.[14] The fruits produced by the celibacy of the Romish clergy are sufficiently known: the bishop of Dunkeld left a natural daughter, from whom Semple of Foulwood derived his lineage.[15] Transgressions of this nature were so common, that they must almost have ceased to be regarded as criminal: Patrick Hepburn, bishop of Moray, had two sons legitimated in one day, and five daughters in another.

It is the secular learning of Bishop Douglas that has chiefly attracted the attention of posterity; but Myln,

[9] Ibid. vol. p. 333.

[10] Pinkerton's Hist. of Scotland, vol. ii. p. 194.—In a letter from the bishop of Bath to Cardinal Wolsey, dated at Rome on the 19th of March, the following passage occurs: "The bishope of Dunkell his servant is come; and I doo the best I cane to helpe and assist hyme in his masters causes, accordyng your grace is commandment." (H. Ellis's Original Letters, second series, vol. i. p. 316.) See likewise p. 323. The earl of Morton was accused of treason, and, among other grounds, "for the tresonable counsale, help, supportacioun, and assistance, gevin to Gawyne bischop of Dunkeld, in his tresonable passing in Ingland:" but an act of parliament, passed in 1524, declared the charge against him, "in all the punctis it contenit, vane, vntrew, and had na veritie." (Acts of the Parliaments of Scotland, vol. ii. p. 290.)

[11] Polydori Virgilii Anglica Historia, p. 53.—According to Hume's calculation, he had reached the forty-sixth year of his age in 1520. His testament may be found in the appendix to Mr Riddell's Reply to the Misstatements of Dr Hamilton, in his late *Memoirs of the House of Hamilton corrected*. Edinb. 1828, 4to. On the 19th of September 1522, it was proved by one of the executors, Mathew Geddes, vicar of Tippermuir, his chaplain. The inventory of the bishop's goods was taken "apud hospitium Domini Dacris." In the British Museum, Calig. B. i. 27, there is an original letter from Douglas to Lord Dacre, in which he says, "our houssys ar of the auld allyat." Mr Riddell has suggested that the testament makes no allusion to the pension mentioned by Holinshed; and that "the bishop seems to have been reduced to straits, as he is obliged to pawn some of his silver plate." But as his mission to England was considered as treasonable, he had an obvious reason for avoiding the mention of an English pension; and in most cases there is no great difficulty in supposing a man's expenses to exceed his income.

who was one of the canons of his cathedral, represents him as eminently skilled in divinity and the canon law. He was perhaps the most learned of the early Scottish poets. Among the ancient poets, his favourites were apparently Virgil and Ovid; among the Christian fathers, his favourite was St Augustin, whom he denominates the chief of clerks. Of the Latin language his knowledge was certainly extensive; and as he states that Lord Sinclair had requested him to translate Homer, we may venture to infer that he was not unacquainted with Greek. It is highly probable that he had completed his education on the continent, and had thus given his studies a more elegant and classical direction. Nor were his talents less conspicuous than his learning. In all his writings he evinces an excursive fancy, with much of the fervour of genius. His allegorical sketches are efforts of no common ingenuity; but what chiefly renders his works interesting is the frequent occurrence of those picturesque and characteristic touches, which can only be produced by a man capable of accurate observation and original thinking. He exhibits perpetual vestiges of a prolific and even exuberant imagination, and his very faults are those of superabundance rather than deficiency. In his descriptions, which are often admirable, he occasionally distracts the attention by a multiplicity of objects, nor is he sufficiently careful to represent each new circumstance in a definite and appropriate manner. His style is copious and impetuous, but it cannot be commended for its purity. In his translation of Virgil he professes to be scrupulous in rejecting Anglicisms, and indeed his diction is often remote from that of the English poets: but he has imported many exotic terms from another quarter; his familiarity with the Latin language betrays itself in almost every page of his writings. His verses, though less smooth and elegant than those of Dunbar, are not unskilfully constructed.

Of Douglas's original compositions the longest is the *Palice of Honour;*[1] an allegorical poem which displays much versatility of fancy and a ready command of striking imagery. Still however it is to be considered as a Gothic structure, and as exhibiting many of the peculiarities which belong to that order: ancient and modern usages, classical and Christian subjects, are almost constantly blended together; and a nymph of Calliope's train expounds the scheme of human redemption. This poem appears to have been composed in 1501, when the author was twenty-six or twenty-seven years of age. It has been surmized that Douglas's work is probably founded on the *Sejour d'Honneur* of Octavien de St Gelais.[2] The titles have indeed an obvious resemblance to each other, but there is little or no affinity in the plan and execution of the two poems. The successive appearance of the different courts described in the Palice of Honour, may possibly remind some readers of the Triumphs of Petrarch, in which various shadowy trains succeed each other in a somewhat similar manner; but notwithstanding these different suggestions, Douglas's poem must still be regarded as entitled to the praise which belongs to an original design.

King Hart, another allegorical poem of the same author, exhibits a very ingenious adumbration of the progress of human life.[3] It is a singular composition, and may remind the reader of Phineas Fletcher's *Purple Island;* a work which furnishes a striking example of the misapplication of fine poetical talents. From the occurrence of several incorrect passages, it has been supposed to be one of Douglas's earliest performances. Incorrect passages we may expect to find in all the vernacular poetry of that age; and the versification appears to us superior to that of the Palice of Honour. As he has not enumerated it among his early works, we may perhaps venture to conclude that it was written after his translation of Virgil. The heart, being the fountain of vital motion, is here personified as man himself, and is conducted through a great variety of adventures.

But the most remarkable of Douglas's works is perhaps his translation of the Æneid.[4] In the original poems which accompany it, he has fortunately specified the origin and progress of this undertaking: he there informs us that it was begun at the request of his cousin Lord Sinclair, whom he represents as a zealous collector of books, and protector of science and literature; and that it was the labour of only sixteen months, being completed on the 22d day of July 1513, about twelve years after he had composed the Palice of Honour. This task must apparently be understood to comprehend, not merely a version of Virgil's twelve books, but likewise of the supplementary book of Mapheus Vegius, together with the original poems which he has interspersed in the volume. Whether we consider the state of British literature at that period, or the rapidity with which he executed so extensive a work, it is impossible to withhold from this version a large share of our approbation. In either of the sister languages, few translations of classical authors had hitherto been attempted. Even in England, it has been remarked, no metrical version of a classic had yet appeared; except of Boethius, who scarcely merits that appellation.[5] On the destruction of Troy, Caxton had published a kind of prose romance, which he professes to have translated from the French; and the English reader was taught to consider this motley composition as a version of the Æneid. Douglas bestows severe castigation on Caxton for his perversion of the classical story; and affirms that his work no more resembles Virgil than the devil resembles St Austin. He has however fallen into one error which he exposes in his precursor; proper names are so completely disfigured in his translation, that they cannot be recognized without some degree of difficulty. In various in-

[1] The Palis of Honoure, compeled by Gawyne Dowglas, Bysshope of Dunkyll. Imprinted at London in Fletstret, at the sygne of the Rose garland, by Wyllyam Copland. 4to. This edition, which is without a date, was probably printed about the same time with the author's translation of Virgil. They are uniformly printed, and both title-pages have the same ornamental border. Another early edition bears the following title: "Heir beginnis ane treatise callit the Palice of Honovr, compylit be M. Gawine Dowglas, Bischop of Dunkeld. Imprentit at Edinburgh be Iohne Ros for Henrie Charteris, anno 1579. *Cum Privilegio Regali.* 4to. The epistle "To the Reidar" begins thus: "Quhen we had sene and considderit the diuers impressiones befoir imprentit of this notabill werk, to haue bene altogidder faultie and corrupt, not onlie that quhilk hes bene imprentit at London, bot also the copyis set furth of auld amangis our selfis." Copland's edition is however the earliest which bibliographers have been able to trace. The Edinburgh edition has lately been reprinted for the Bannatyne Club. Edinb. 1827, 4to.

Imprinted at London, 1553, 4to. Another edition, with a life of the translator by Sage, and a glossary by Ruddiman, appeared after a long interval. Edinb. 1710, fol.

[5] Warton's Hist. of English Poetry, vol. iii. p. 112.

stances, he has been guilty of modernizing the notions of his original: the Sibyl, for example, is converted into a nun, and admonishes Æneas, the Trojan baron, to persist in counting his beads.

Douglas's translation of Virgil is certainly executed with no mean ability; it is the effort of a bold and energetic writer, whose knowledge of the original language,[1] and prompt command of a copious and variegated phraseology, qualified him for the performance of so arduous a task. It is indeed to be regretted that he did not devote a much longer period to this undertaking: he might thus have been enabled to render his versification more terse and finished; but the work, in its present state, is a singular monument of his genius and industry. One of his principal objects was to write in plain and intelligible language, so that his favourite poet might be readily understood by his countrymen; and by keeping this object constantly in view, he has frequently attained to less elevation of style than might have been expected. His translation possesses one merit which he probably did not contemplate: as a version of a well-known classic, it presents an ample fund of philological information; and Ruddiman's excellent glossary has long recommended it to all those who have paid any particular attention to the etymology of the Scottish language. The felicity of this translation has been very warmly commended by another Scottish prelate, Dr Lesley, the celebrated bishop of Ross; who, in enumerating its various excellencies, has stated that it always renders one verse by another. But this regularity of correspondence, for which it has likewise been praised by Dempster, must not be too literally understood; and it may be proper to recollect that the verses of the two poets, although they might be equal in number, could not be equal in length, as a hexameter line may consist of seventeen, and cannot consist of fewer than thirteen syllables.

The bishop of Dunkeld's version of the Æneid seems to have suggested a similar plan to the earl of Surrey, who translated the second and fourth books into English. In this translation he has exhibited the earliest specimen of blank verse that occurs in the history of English poetry. Dr Nott has remarked that "we meet with so many expressions which Surrey has evidently borrowed, with so many lines adopted with hardly any other alteration than that which the difference of the dialect, and the measure made necessary, and so many taken without any alteration at all, that all doubt ceases. It becomes a matter of certainty that Surrey must have read and studied the Scottish translation before he began his own."[2] This assertion he has verified by a long series of parallel passages, which it is impossible to read without acquiescing in his opinion.

The several books of Douglas's translation are introduced by prologues, which, in the opinion of Warton, are often highly poetical, and shew that his proper walk was original poetry. They have likewise received warm commendation from Hume of Godscroft, who was himself a scholar and a poet. "In his prologues before every book," he remarks, "where he hath his liberty, he sheweth a natural and ample vein of poesy, so pure, pleasant, and judicious, that I believe there is none that hath written before or since, but cometh short of him. And, in my opinion, there is not such a piece to be found as his prologue to the eighth book, beginning *Of drevilling and dreams*, &c. at least in our language."

These are the only works of Bishop Douglas with which we are now acquainted. On concluding his translation of Virgil, he avowed a resolution to devote his future days to the service of the commonwealth and the glory of God. The earliest of his poetical performances appears to have been a translation of Ovid *De Remedio Amoris;* but of this translation no copy is known to be extant.

> Lo thus, followand the floure of poetry,
> The battellis and the man translate haue I,
> Quhilk zore ago in myne undantit zouth,
> Unfructuous idilnes fleand, as I couth,
> Of Ovideis Lufe the Remede did translate,
> And syne of hie Honour the Palice wrate.

Bale mentions another of his compositions under the title of "Aureæ Narrationes;" which Sage supposes to be the short commentary noticed in the concluding address to Lord Sinclair:

> I haue also ane schorte commend compyld,
> To expone strange historiis and termes wylde.

This comment, as the same biographer conjectures, may have been merely a brief explanation of the classical mythology. If we may rely on the authority of Bale and Dempster, he likewise composed comedies; but both these writers are apt to multiply books as well as authors. Another biographer is inclined to suppose that he may have written the Flowers of the Forest, a song which displays no small portion of pathetic simplicity. "It may be conjectured," says Mr Scott, "that he was the author of that celebrated elegaic song, which describes the devastation occasioned by the battle of Flowdon, in that part of the country with which he had long been well acquainted."[3] It was published by Mr Lambe in the year 1774, and is described by him as an old Scotish song;[4] and Mr Ritson, who thought it "as sweet and natural a piece of elegaic poetry as any language can boast," had no hesitation in believing it to have been composed immediately after the battle of Flodden-field;[5] a decision which sufficiently evinces that, notwithstanding his confidence in his own judgment, and his undisguised contempt for almost all his predecessors, his critical opinions on such subjects were very far from being infallible. According to a more authentic account, the tune and two detached verses of this song are ancient; and all the others were composed by a lady connected with the county of Roxburgh.[6] The language and versification are evidently of a more recent date than the year 1513; nor could such a composition be safely referred to any period preceding the last century. (D. I.)

DOUGLAS, the capital of the Isle of Man, situated on a fine bay on the east coast of that island, in Lat. 54. 10. N., Long. 4. 27. W. Pop. (1851) 9880. In summer it is much frequented as a watering-place by parties from Liverpool and other places, and in consequence it has of late years undergone considerable improvements; but many of its old streets are irregular, narrow, and dirty. A fine square, several handsome terraces, and numerous detached villas, are among its recent improvements. Castle Mona, a large and handsome building, formerly one of the seats of

[1] See however the remarks of Francis Junius, which are contained in a letter published in "The Life, Diary, and Correspondence of Sir William Dugdale," p. 383. Lond. 1827, 4to.

the Duke of Atholl, is now used as an hotel. Among the public buildings may be noticed the custom-house, court-house, market-house, house of industry, odd-fellows' hall, and public hospital. Douglas has an ancient parish church, partially rebuilt in 1773, several chapels, and places of worship for Catholics, Methodists, &c.; national, infant, and other schools; mechanics' institute; museum; and several libraries. It has some coasting trade and fisheries. Liverpool, Glasgow, and Irish steamers, frequently touch here. The harbour is dry at low water; but vessels drawing from 10 to 14 feet may enter, the former at high water neaps, the latter at high water springs. The pier—520 feet in length, and upwards of 40 in breadth—has a lighthouse at its northern extremity.

DOULEIA (from δοῦλος, *a slave*), in *Antiquity*, denoted the condition of the subject allies of the Athenians; and was also used to designate the servile class generally.

DOUNE, a village of Perthshire, Scotland; situated on the left bank of the Teith, 6 miles N.W. of Stirling. Pop. (1851) 1459, mostly employed in the extensive cotton works of Deanston, in the immediate vicinity. The ruins of Doune Castle, a large and massive fortress, built about the fourteenth century, are situated on the point of a steep and narrow elevation, washed on one side by the Teith, and on the other by the Ardoch. It was anciently the seat of the earls of Menteith; but about the beginning of the fifteenth century it was forfeited to the crown, and became the favourite residence of the dukes of Albany, who governed Scotland during the captivity of James I. Queens Margaret and Mary are also said to have frequently resided in this fortress. It was held for Prince Charles in 1745; and here he confined his prisoners taken at Falkirk, and among the rest the author of the tragedy of *Douglas*.

DOUR, a town of Belgium, province of Hainault, and arrondissement of Mons, 8 miles W.S.W. of the town of that name. Pop. (1850) 6783, chiefly employed in the coal mines and iron-works of the vicinity.

DOURO, a river of Spain. See SPAIN, and PORTUGAL.

DOUW, GERHARD, a celebrated painter, was born at Leyden in 1613, and received his first instructions in drawing and design from Bartholomew Dolendo, an engraver, and from Peter Kouwhoorn, a painter on glass. At the age of fifteen he became a disciple of Rembrandt; and in that famous school he continued for three years.

From Rembrandt he learned the true principles of colouring, and obtained a complete knowledge of chiaroscuro; but to that knowledge he added a delicacy of pencil, and a patience in working up his colours to the highest degree of finish. He was more pleased with the early pictures of Rembrandt than with those by which he was distinguished in his more advanced age; because the first seemed finished with greater care and attention than his later works, which displayed more boldness, freedom, and negligence—a style that was quite contrary to the taste of Douw. But although the manner of Gerhard Douw appears so different from that of his master, yet it was to Rembrandt alone that he owed that excellence in colouring by which he triumphed over all the contemporary artists of his own country.

His pictures are usually of a small size, with figures so exquisitely touched, so transparent, so wonderfully delicate, as to excite astonishment as well as pleasure. He designed every object after nature, and with an exactness so singular, that each object appears a perfect transcript of nature in respect to colour, freshness, and force. His general manner of painting portraits was by the aid of a concave mirror, and sometimes by looking at the object through a frame crossed with many exact squares of fine silk thread. But this custom is now abandoned, as the eye of a good artist seems a more competent rule, though the use of the mirror is still practised by some painters in miniature.

It is almost incredible what sums have been given, and are still given, for the pictures of Douw, both in his own and in other countries; for he was exceedingly careful in giving them the highest degree of finish, and patiently assiduous beyond example. Of that patience Sandrart gives a very strong proof in a circumstance which he mentions relative to this artist. Having once, in company with Bamboccio, visited Gerhard Douw, they could not forbear admiring the exquisite minuteness of a picture which he was then painting, and in particular noticed a broom, at the same time expressing their surprise at the excessive labour bestowed on such an unimportant object; upon which Douw told them he would spend three days more in working on that broom before he should consider it entirely complete. The same author relates that the wife of his great patron, M. Spiering, sat to Douw five days for the finishing of one of her hands. In consequence of his tedious style of painting, few persons would sit to Douw for their portraits; and he therefore devoted his labours chiefly to works of fancy, in which he could introduce objects of still life, and employ as much time on them as suited his own inclination. Houbraken states that M. Spiering allowed him a thousand guilders a-year, and paid besides whatever he demanded for his pictures, having purchased some of them for their weight in silver; but Sandrart, with more probability, assures us that the thousand guilders a-year were paid to Gerhard on no other consideration than that the artist should give his benefactor the option of every picture he painted, for which he was immediately to receive the utmost he demanded. This celebrated painter died in 1674, aged sixty-one.

DOVE. See ORNITHOLOGY.

DOVE-TAILING, in *Carpentry*, a method of joining together boards or timbers by cutting on the end of one piece projections in the form of a dove's tail spread, or a wedge reversed, and inserting these projections into hollows of a corresponding shape in the other piece. This forms the strongest of all joints, because the tenons or projecting pieces, from their form, cannot be drawn out.

DOVER (the ancient *Dubris*), a municipal and parliamentary borough, and one of the Cinque Ports of England, in the county of Kent, 71 miles E.S.E. of London. It is situated on the N.W. coast of the Straits of Dover, in a deep valley formed by an opening in the chalk hills which surround it in the form of an amphitheatre. On one of these hills, to the eastward of the town, and rising abruptly to the height of 320 feet above the sea, stands the ancient castle. The walls of this castle inclose an area of nearly 35 acres; containing towers and other buildings of various ages from the time of the Romans to recent times, and having accommodation for a garrison of from 3000 to 4000 men. Other portions of the heights around the town are also fortified. The town has been greatly extended of late years. A continuous line of buildings now unite it with the villages of Charlton and Buckland, which are included within its boundaries. Between the east end of the town and the castle cliffs is what may be called the new town, where superior houses have been erected for the accommodation of visitors. The old part of the town is irregularly built, and the streets are narrow and dirty. Dover has two ancient parish churches, St Mary's and St James's, the former having a Norman tower; two recently built churches; a Roman Catholic, and several Dissenting chapels; national, free, and infant schools; reading-rooms, and libraries; theatre; assembly rooms; and public baths. Many attempts have been made to improve the harbour, but with comparatively little success, from the constant accumulation of sand and shingle at its mouth. The entrance is narrow, and is between two piers. The vessels registered at the port on 31st December 1853 were 70, of the aggregate burden of 3926 tons: of these 48 vessels of 1369 tons were under 50 tons each, and 1 was a steamer of 54 tons. The vessels entered and cleared at the port during 1853 were

as follows: Coasting trade, inwards, 443, tonnage 34,310; outwards 104, tonnage 5348; colonial trade, inwards 3, tonnage 252; outwards 1, tonnage 260; foreign trade, sailing vessels, inwards 69, tonnage 5870; outwards 45, tonnage 2097; steamers, inwards 90, tonnage 11,960; outwards 1, tonnage 140. Dover is the principal station and the seat of government of the Cinque Ports. It is governed by a mayor, 6 aldermen, and 18 councillors; and returns 2 members to parliament. Pop. (1851) 22,244.

DOVER, a town in the state of New Hampshire, North America, and capital of the county of Strafford, is situated on the W. side of Piscataqua river, and watered by its tributaries the Cocheco and the Black river; 60 miles N. of Boston. The Cocheco has here a sudden descent of 32½ feet, producing a great water-power, and being at the head of tide-water and 12 miles from the sea, sloops can come up to within a short distance of the mills. It has numerous and extensive manufactures, chiefly of cotton goods; a considerable shipping; and is one of the most flourishing towns in the state. Dover is the oldest town in this state, having been settled in 1623. Pop. (1850) 8186.

DOVER, the capital of the state of Delaware, and of the county of Kent, is situated on high ground, between the two principal branches of Jones's Creek, ten miles above its entrance into Delaware Bay. It is regularly laid out, with wide streets crossing each other at right angles. The principal public building is the state house, an elegant and commodious edifice. There is also a splendid monument erected to the memory of Colonel John Haslett, who fell in the battle of Princeston. Pop. 3932.

DOWAGER (Fr. *douairière*, *dower*, from Lat. *doto*, to *endow*), a widow with a jointure; a title more particularly given to the widows of princes and persons of rank. *Queen-dowager* is the designation of the widow of a king.

DOWEL, a wooden or iron pin or tenon, used for joining together two pieces of wood, &c. Corresponding holes being made in the edge of each of the two pieces, one half of the dowel is inserted into the hole in the one piece, and the other piece is then driven home on it.

DOWER (Lat. *dos*, and *dotarium*), that portion of lands or tenements of a man which his widow enjoys during her life, after the death of her husband; and which, at her death, descends to his heirs. It also signifies the property which a woman brings to her husband in marriage, and likewise any endowment or gift. It is sometimes written dowry.

DOWLAS, a kind of coarse strong linen cloth.

DOWLETABAD, a celebrated city and fortress of Hindustan, province of Hyderabad, deemed impregnable by the natives. The fort stands on the summit of a mountain, which is surrounded with several stone walls, the lowest of which incloses the town. The two lower fortifications are in this manner completely commanded by the upper. Like all the other hill forts of India, it is unhealthy, but is still considered as the key of the Deccan. This place, notwithstanding its strength, has been frequently taken. When the Mohammedan powers carried their arms into this part of the Deccan, about the year 1203, it was the residence of a powerful rajah, and was plundered of immense riches. In 1306 it was reduced by Mallek Naib, the emperor of Delhi's general. In the early part of the fourteenth century, the Afghan emperor Mohammed III. attempted to render this place, as its present name implies, the "abode of prosperity," and with this view he endeavoured to force the inhabitants of Delhi to quit their habitations and to emigrate to the Deccan; but he was unable to carry this violent scheme into effect. About the year 1595 Dowletabad surrendered to Ahmed Nizam, shah of Ahmednuggur; and on the fall of his dynasty it was taken possession of by Mallek Amber, an Abyssinian slave. His successors reigned till 1634, when it was taken by the Moguls; and it is now comprehended in the territories of the Nizam, but has much declined since the foundation of Aurungabad in its vicinity. The district of Dowletabad is situated chiefly between the 19th and 20th degrees of north latitude, and extends along the north side of the Godavery. The city is in Lat. 19.57.; Long. 75.18. (E. T.)

DOWN, a maritime county in the south-eastern part of the province of Ulster, in Ireland; bounded N. by the county of Antrim and Belfast Lough, E. and S. by the Irish Sea, and W. by the county of Armagh. Down comprises 967 square miles, or 612,495 acres; of which 514,180 are arable, 78,317 uncultivated, 14,355 in plantations, 2211 in towns, and 3432 under water.

On the authority of Ptolemy, this county is supposed to have been anciently inhabited by the tribes of the Vinderii and Voluntii, but afterwards formed part of the ancient principality of Ulidia or Dalriada, from which colonies branched into Scotland, where they afterwards united with the Scottish monarchy, and became historically more important than the parent stock. After the arrival of the English, who, under the leadership of the celebrated John de Courcy, overran the district, it was parcelled out among the English families of White, Savage, Riddel, Poer, Sendall, Chamberlain, Russell, Audley, Copeland, &c., descendants of some few of which remain at the present day in the county. Down formed two counties, Newtownards in the north and Down in the south, from the period of the English settlement to the Irish revolt in 1333, when the English settlers were driven into the maritime baronies of Ards, Lecale, and Mourne, of which they in part retained possession. The remainder of the district fell into the hands of Irish families, the O'Neills of Clandeboy, the MacArtans, MacRorys, and MacGinnises, whose possessions, however, reverted to the crown on the attainder of Shane O'Neill, in the latter half of the sixteenth century; but having afterwards submitted to the government, they received back their former estates. In 1602 the O'Neill estates were again forfeited, and granted to Sir Hugh Montgomery and Mr Hamilton, who planted Scottish colonies on the land. The estates of the remaining old Irish and Anglo-Norman families were mostly forfeited in the rebellion of 1641, or subsequently at the Revolution.

The county is now divided into eleven baronies, Ards Lower and Upper, Castlereagh Lower and Upper, Dufferin, Iveagh Lower and Upper, Kinelearty, Lecale, Mourne, and Newry lordships: these baronies are subdivided into 70 parishes, forming the diocese of Down, which includes all the sea-coast and eastern part of the county, the greater portion of that of Dromore, and the lordship of Newry, which is exempt from episcopal jurisdiction, a privilege which it enjoys from having appertained to a monastery before the Reformation. On the dissolution of the monastery the powers and privileges of the lord-abbot were transferred to the temporal proprietor, Sir Nicholas Bagnall, to whom a patent was granted by Edward VI. "on account of his excellent services as marshal of Ireland." The proprietor of the present patent, the Earl of Kilmorey, is entitled the Lord Abbot, and is *ex officio* rector of Newry, and, by his vicar-general and surrogate, grants probates of wills, letters of administration, marriage licenses, &c., and transacts the business of an ecclesiastical court, with as full power as that of any other ecclesiastical court in Ireland.

The union workhouses are at Banbridge, Downpatrick, Kilkeel, Newry, and Newtownards. Portions of the county are also included in the neighbouring unions of Belfast, Lisburn, and Lurgan. The net annual value of property rated to the poor is L.637,989, and the amount of property valued under the 6th & 7th Wm. IV., cap 84, amounts to L.455,697. The county is within the military district of Belfast. There are 24 coast-guard stations, with about 160 men and officers. The assizes are held at Downpatrick, where the county prison and county infirmary are situated. The district lunatic asylum is at Belfast, in the county of

Antrim. There are savings-banks at Newry and Hillsborough, with deposits amounting to about L.45,000.

The chief towns are as follows:—Downpatrick (pop. 4098), of very ancient foundation, supposed to be the oldest town in Ireland), and a parliamentary borough, situated within a mile of Strangford Lough; Newtownards (pop. 9567), formerly a parliamentary borough, and in the neighbourhood of numerous religious foundations, now a flourishing town, belonging to the Marquis of Londonderry, whose residence, Mount Stewart, is within three miles distance; Banbridge (pop. 3301), the centre of the linen trade of Ulster, standing on a hill on the left bank of the Bann, from which, and the bridge by which it is crossed, the name originated; Donaghadee (pop. 2818), the nearest port to Scotland, formerly a packet-station, now a trading-port and pleasant sea-bathing place; Bangor (pop. 2850), a small ancient seaport, with a good harbour, and fine beach adapted for bathing; Rathfriland (pop. 2053); Portaferry (pop. 2074); and Newry (pop. 13,491, of which number 3875 are in the county of Armagh), a place of considerable trade, and with great natural advantages of situation.

The population of the county of Down, which Beaufort in 1792, estimated as amounting to 201,500, has been found, according to the parliamentary returns at various periods, to have been as follows:—in 1821, 325,410; in 1831, 352,012; in 1841, 361,446; and in 1851, 320,817.

In 1824–26 the number of children receiving education in 550 schools was 13,456 boys and 8375 girls; the total number amounting to 22,828, of whom 4347 were Protestants of the Established Church, 6120 were Roman Catholics, and 11,615 Dissenters, chiefly Presbyterians; and a remaining number of 411, whose religious persuasion was not ascertained. In 1851, according to the census returns, the state of education of the population, five years old and upwards, was as follows:—

	Rural Districts.	Civic Districts.	Total.	Propor. per cent. in 1851.	Propor. per cent. in 1841.
Could read and write..	107,597	16,731	124,328	44	39½
Could read only.......	81,108	11,085	92,193	31½	33
Could neither read nor write..	61,689	7,786	69,475	24½	27½

The diocesan grammar-school of Down, at Downpatrick, is now formed into a joint district school for Down and Dromore.

The Presbyterian form of worship predominates, especially in the towns and low country. In the mountainous part the Roman Catholic religion prevails to a great extent. In 1834 the population, divided according to their religious persuasion, was ascertained to consist of 27,662 Churchmen, 98,961 Presbyterians, 3530 other Protestant Dissenters, and 58,405 Roman Catholics.

Previous to the union with Great Britain, Down returned fourteen members to the Irish parliament; two for the county at large, aud two for each of the boroughs of Bangor, Downpatrick, Hillsborough, Newry, Newtonards, and Killileagh. Since the union it has been represented by four members, two for the county, one for Downpatrick, and one for Newry, the Reform act having made no change in the number or distribution of the representatives.

So far as inequality of surface is essential to scenic beauty, this county, presenting every variety of plain, hill, and mountain, has strong claims to it. The plains are chiefly confined to the vicinity of rivers, the hills occupy the greater portion of the surface, and the mountains are accumulated together in one immense mass in the southern barony of Mourne. Slieve Donard, the highest summit of the Mourne mountains, is 2796 feet above the level of the sea, and, excepting Lugduff in Wicklow and several summits near Killarney, it is not exceeded in height by any other mountain in Ireland.

The Mourne Mountains and their subordinate branches give rise to the four principal rivers. The Bann (lower) rises near the Irish sea, and flows north-eastward by Banbridge and Portadown into Lough Neagh; the Lagan rises on the northern declivities of the Slieve Croob mountains, four miles south of Ballinahinch, and flowing in various directions to the boundary of the county, continues its course through an eminently beautiful country to Belfast; the Annacloy, or Ballinahinch river, rises near Hillsborough, and discharges its waters into the southern extremity of Strangford Lough, about a mile below Downpatrick; the Newry Water is an insignificant stream, except where it is affected by the influence of the tide, and would be unworthy of notice but that it is the commencement of a water communication by canal with Lough Neagh. The Newry navigation or canal, which was the first completed in Ireland, opens a water communication with the counties of Antrim, Armagh, Derry, Down, and Tyrone; and, by means of the Ulster Canal (which connects Lough Erne and Lough Neagh), Cavan, Fermanagh, and Monaghan export and import their merchandise through the port of Newry.

Lakes, properly so called, are numerous, but insignificant in extent. Strangford Lough, with its numerous islands, old castles, abbeys, and ornamented shores, is a spacious gulf extending ten miles northwards into the land, and affording a secure roadstead to large vessels in its interior. Strangers, however, are unwilling to have recourse to it, on account of the rapid current of the tide, which rushes through the narrow strait between Portaferry and Strangford at the rate of eight or ten miles an hour, which, with sunken rocks and shoals, renders the navigation dangerous. This gulf is studded with numerous islands, some beautifully wooded, others affording rich pasturage. Bangor, Killough, and Ardglass, have each a harbour for fishing-boats and small craft. An artificial harbour was constructed at Donaghadee for the accommodation of the packet-boats to Scotland; but the introduction of steam navigation has rendered it comparatively useless. Near the coast of the Ards, a long narrow peninsula between Strangford Lough and the sea, are the Green Island, Bird Island, and Burr Island; and at the entrance of Carrickfergus Bay is a group of three, called the Copeland Islands, upon the lesser of which stands a lighthouse. There is also a lighthouse at Haulbowling Rock off Carlingford Bay, one at Ardglass Harbour, one at St John's Point near Ardglass, and another on a sunken reef called the South Rock, near the northern entrance of Strangford Lough. At the northern extremity of the county is Belfast Lough; and on the south, dividing Down from Louth, is Carlingford Bay or Lough—a highly picturesque marine inlet, forming a perfectly safe harbour of refuge, but obstructed by a bar at its entrance.

The mineral springs found here are of two qualities, sulphuro-chalybeate and purely chalybeate. The most celebrated of the former kind is at the foot of Slieve Croob Mountain, which rises to the height of 1800 feet—about two miles from Ballinahinch. In appearance, taste, and effects, it strongly resembles the waters of Aix-la-Chapelle. It is used both externally and internally, and has been found peculiarly effective in scorbutic affections. The town is much frequented in summer by invalids. Chalybeate springs are numerous, and widely scattered through the county. On the sea-coasts are many places admirably adapted for sea-bathing and summer residence. Dundrum, on the bay of the same name, is a small retired watering-place, owned by the Marquis of Downshire; Ardglass, formerly one of the chief seats of trade in Ulster, and a parliamentary borough, is delightfully situated, and, besides being the chief fishing port on this coast, ranks high as a bathing place; Holywood, on the eastern shore of Belfast Lough, is much frequented; Warrenpoint, at the head of Carlingford Lough, is much frequented by the inhabitants of Newry; Newcastle, on

Dundrum Bay, is also a fashionable marine summer residence; Kilkeel, close by the open coast and backed by the Mourne Mountains, is a thriving town and agreeable bathing place; but above all others in attraction is Rosstrevor, which is not exceeded in beauty of situation by any place in Ireland. "Were such a bay lying upon English shores," says Mr Thackeray in his Irish Sketch-Book, "it would be a world's wonder; perhaps if it were on the Mediterranean or the Baltic, English travellers would flock to it in hundreds.

The predominating soil is a loam of little depth, in most places intermixed with considerable quantities of stones of various sizes; but differing materially in character according to the nature of the subsoil. Clay is mostly confined to the eastern coast of the Ardes, and to the northern parts of Castlereagh. Of sandy soil the quantity is small; it occurs chiefly on the sea-coasts, especially near Dundrum. Moor grounds are mostly confined to the skirts of the mountains. Bogs, though frequent, are scarcely sufficient to form a supply of fuel to the population. There are several quarries of fine sandstone. The best is that on Scrabb Hill, near Newtownards, where a very close-grained, clear-coloured, and hard and durable stone is raised. Limestone is not very general. The quarries of Kilwarlin afford flags of large dimensions, varying in hue from a clear stone colour to a brownish red; the former being superior in beauty and hardness. Slates are raised in several parts, inferior to the Welsh in lightness and colour; large blocks of a yellowish magnesian limestone are found near Holywood. This kind, however, is inferior to the white species as a manure. Near Comber, on the shores of Strangford Lough, is a very hard and sparkling kind of reddish granular limestone. But the greatest magazine of this rock is in the vicinity of Moira. It is supposed to be a continuation of that bed which is perceptible, with little interruption, from Magilligan in Londonderry, round the headlands of Antrim, to the range of mountains that lie north of Lisburn, whence turning westward, it is lost in the acclivities that border the Lagan between Moira and Magheralin. Here the stone lies very near the surface. It is found in horizontal strata intermixed with chert, in some cases in layers, in others in detached pieces of different form and size, containing various kinds of shells and other marine exuviæ. Granite occurs in many places in detached masses, but the great body of it is confined to the southern and western regions, chiefly in the Mourne Mountains, where it differs in mineral character from the Wicklow granite, in containing hornblende and felspar of a reddish colour. Though it is here the prevailing rock, it does not wholly exclude the schist or slate, which is often seen in contact with it. In the granite of Slieve Donard, the highest of the Mourne Mountains, crystals of topaz and beryl are found. Indications of lead have been discovered near Castlewellan, Killough, Newtownards, and Warrenpoint; and traces of copper in the Mourne Mountains near Rosstrevor.

The land is very unequally portioned out among the inhabitants; the number of holdings in 1853 not exceeding 1 acre in extent being 1793, and those above 1 acre 29,289, of which 5000 were between 1 and 5 acres, 12,568 between 5 and 15, 7259 between 15 and 30, 2879 between 30 and 50, 1296 between 50 and 100, 207 between 100 and 200, 59 between 200 and 300, and 21 above 500 acres in extent. There are many landed proprietors, mostly resident, each of whom holds large tracts in his own hands. Under these is a numerous tenantry of every grade, from those who deem themselves entitled to rank on nearly an equal footing in society with the proprietors of the soil, to the holders of a few acres, who depend on their manual labour for the support of their families. The great bulk of the population is orderly and industrious. Their dwellings are better constructed and furnished than those of a similar class in most other parts of Ireland. The processes of agriculture, owing in a great degree to the example set by the resident gentry, are as skilfully carried on as in any part of Ireland. The crops chiefly cultivated are wheat, rye, barley, oats, peas, flax, and potatoes. Barley is extensively grown, particularly in the light soil of Lecale. Green crops are also in general use. Much attention is paid to the culture of grass, particularly on the borders of the larger rivers, where extensive tracts of fine meadow land are annually enriched, by the overflowing of the banks, with deposits of the finer particles of mould washed down from the higher grounds. The extent of land under crops in 1853 was 308,100 acres—viz. corn, beans, and peas, 174,204; potatoes, 42,085; turnips, mangold-wurzel, carrots, and other root crops, 28,126; cabbage, vetches, and other green crops, 3353; flax, 26,957; and meadow clover and rape, 33,375 acres. The mean rate of produce per acre exceeds the average of productiveness for all Ireland in beans, peas, potatoes, turnips, mangold-wurzel, and cabbage; the cereal crops of the county being below the average. The total produce of corn, beans, and peas in 1853 was 118,958 tons, or 823 lb. per head of the population, the average for Ireland being 700 lb.; of potatoes 2,452,075 barrels were grown in 1853, averaging 151 barrels per head, or 11 barrels above the general average. In an inquiry instituted for the purpose of ascertaining the condition of the farms in the 32 counties of Ireland, Down stands number six on the list; and in another as to the comparative condition of the road sides, this county appears third in order, and therefore may be considered as one of the best cultivated and least neglected in Ireland.

Horned cattle are principally reared for dairies, and therefore the same attention to figure and flesh is not paid as in some other agricultural districts. The resident gentry are, however, laudably emulous in the improvement of their respective stocks. The breed of horses is also an object of much attention, and some of the best racers in Ireland have been bred in this county. The native breed of sheep, a small hardy race, is confined to the mountains. Many of this breed are well made and finely woolled. The various other kinds of sheep have been much improved by judicious crosses from the best British breeds. Hogs are reared in great numbers, chiefly for the Belfast market, where the large exportation occasions a constant demand for them—hams of very superior quality being prepared from them in that town. Rabbits also form a part of farm stock in the sandy southern tracts.

In 1841 the live stock of the county consisted of 31,174 horses and mules, 70,601 horned cattle, 25,530 sheep, 59,427 pigs, 279,696 head of poultry, and 260 asses; the estimated value of all being L.817,917; while in 1852 on 29,595 holdings there were 31,453 horses, 1330 mules and asses, 119,309 cattle, 45,968 sheep, 54,254 pigs, 9702 goats, 402,963 head of poultry, of the total value of L.1,163,308.

Manufactures, of which linen is the staple, are carried on largely in the neighbourhood of Belfast and Newry, and several of the smaller towns have risen to importance as places of manufacture. The finer fabrics of linen are the chief articles of manufacture. In 1850 there were eleven flax mills in the county employing 4352 persons. The woollen manufacture is confined to a coarse cloth wrought solely for home consumption.

The fisheries are by no means so extensive or flourishing as the great extent of sea-board would warrant. Belfast market is chiefly supplied from Carrickfergus, yet fish of every description abound on the coast of Down. The fishery districts of Donaghadee, Strangford, Newcastle, and Carlingford comprise 139 miles of maritime boundaries, having, in 1853, 1468 registered fishing vessels, employing 4642 men and boys. Shoals of herrings frequently go up to Strangford Lough, but these are not so much esteemed as those caught in the open sea. Smelts are taken in large quantities at the entrance of the same lough. Shell-fish abound along the rocky shores, particularly in the neighbourhood of the Copeland Islands. Oysters of superior quality are dredged at Ringhaddy, Carlingford, and Bangor; and mussels in inexhaustible numbers cover the shallow banks that stretch out before Holywood.

Several remains of antiquity, coeval with the rudest ages of society, are to be found in this county. At Slidderyford, near Dundrum, is a group of pillar stones, consisting of ten or twelve, from eight to ten feet in height, forming a circle. A remarkable cairn, on the summit of Slieve Croob, is nearly eighty yards in circumference at the bottom and fifty at the top, forming a platform, on which several cairns of various heights and dimensions are erected. Another cairn near the village of Anadorn was found to cover a cave containing ashes and a number of human bones. Several cromlechs, or altars so called, also exist, the most remarkable of which is in the Giant's Ring, on the summit of a hill between Lisburn and Belfast. It is formed of an unwrought stone seven feet long by six and a half broad, resting in an inclined position on several rude pillars from two to three feet high. It stands nearly in the centre of an inclosure about one-third of a mile in circumference, formed of a rampart of earth about twenty feet high, sloping on each side, and broad enough at the top for two persons to ride abreast. Near Downpatrick is a rath or mound of earth three quarters of a mile in circumference, its exterior consisting of three artificial ramparts, the largest of which is thirty feet broad. In its vicinity are the ruins of Saul Abbey, said to have been founded by

St Patrick; and Inch Abbey, founded by Sir John de Courcy in 1180. The number of monastic ruins is also considerable. The most ancient and celebrated is the Abbey or Cathedral of Downpatrick, supposed to have been founded by St Patrick soon after his arrival here in 432, and said to contain his remains, together with those of the other favourite saints of the Irish, St Columb and St Bridget. It was restored in 1790, when the adjoining round tower was taken down. Beneath the foundation of the round tower a wall was found to proceed to the main building of the abbey. Struel, or as it is sometimes called, St Patrick's Wells, to the east of Downpatrick, merits notice from its connection with former religious observances. These wells are four in number, each covered by a stone vault, and having the water conveyed from the others by subterraneous aqueducts. Great numbers of people from various parts of Ireland resort to this place on Midsummer eve, and on the Friday before Lammas, to perform religious ceremonies, chiefly consisting of penances, and to obtain relief from bodily complaints. The ruins of many castles, particularly upon the coast, are still visible. Amongst the most remarkable is Greencastle, built on an islet in the barony of Mourne, by De Burgo Earl of Ulster, and intended to maintain a communication between the English settlers in this county and those in the county of Louth. This castle was considered of much importance; and in consequence of the rapid assimilation of manners and the sympathy usually found to exist between the natives and the descendants of settlers, no person but one of English birth was permitted to be its constable. (H. S—R.)

Down, the fine feathers on the breasts of several birds, particularly of the duck kind. That of the eider duck is the most valuable. These birds pluck the down from their breasts and line their nests with it. Three pounds of this down may be compressed into a size scarcely larger than one's fist; yet it is afterwards so dilatable as to fill a quilt five feet square. That found in the nests, and termed *live down*, is most valued; being much more elastic than that plucked from the dead bird.

DOWNHAM, a market-town of England, county of Norfolk, on the right bank of the Ouse, which is here crossed by a stone bridge, 11 miles S. of Lynn. Pop. (1851) 2867. The town is situated on an acclivity, the summit of which is occupied by the parish church, an ancient Gothic edifice, with a low embattled square tower surmounted with a spire. The market is held on Saturday, and is noted for its supply of fish and wild fowl.

DOWNPATRICK, a municipal and parliamentary borough and market-town of Ireland, capital of the county of Down, 74 miles N.N.E. of Dublin. It is situated in the bottom of a valley formed by hills of some elevation, near the S.W. extremity of Strangford Lough, and is divided into the English, Irish, and Scotch quarters. It consists of four main streets meeting near the centre, the principal of which are the Irish and English streets. In the former all business is carried on; the latter is well built, and contains several neat private residences. The principal buildings are the cathedral parish church, Roman Catholic chapel, two Presbyterian and three Methodist meeting-houses, diocesan school, county court-house, prison, alms-houses, widows' houses, barracks, infirmary, and fever hospital. A small trade is carried on at Strangford Lough by means of vessels of 100 tons, which discharge at Quoil quay, about a mile from the town; it is, however, projected to deepen the Quoil river, and make a harbour close to the town. The linen manufacture is carried on to a small extent, as well as brewing, tanning, and soap-making. Market-days Tuesday and Saturday. Adjoining the town are the ruins of Inch Abbey, a large rath in good preservation, and a race-course. Pop. (1851) 4098. Downpatrick returns a member to parliament; constituency (1853) 222. Previously to the Reform act it was the most open borough in Ireland; as all the persons who paid scot and lot, or boiled a pot, in the town, were electors.

DOWNS, a bank or elevation of sand, which the sea gathers and forms along its shores, and which serves it as a barrier. The word is formed from the French *dune*, or the Celtic *dun*, a mountain. Charles de Visch (*Compend. Chronolog. Exord. et Progress. Abbat. Clariss. B. Mariæ, de Dunis*) says, *Vallem reperit arenarum collibus, quos incolæ* Duynen *vocant, undique cinctam.*

It is also applied to a large open plain, primarily on elevated land.

Downs is particularly applied to a famous roadstead for ships along the eastern coast of the county of Kent, from Dover to the North Foreland, where both outward and homeward bound ships frequently make some stay, and squadrons of men-of-war rendezvous in time of war. It affords excellent anchorage, and is defended by the castles of Deal, Dover, and Sandwich.

DOWNTON, a town of Wiltshire, formerly a parliamentary borough, but disfranchised by the Reform act. It is situated on the Avon, which is here divided into three branches, each of which is crossed by a bridge, 6 miles S.S.E. of Salisbury. It consists chiefly of one long irregularly built street. The principal building is the parish church, a large cruciform edifice with a tower. The market formerly held here has long been discontinued. Pop. (1851) 2727.

DOWRY, the money or fortune which the wife brings her husband in marriage. It is otherwise called *maritagium*, or marriage goods, and is considered to differ from dower; but this distinction is merely arbitrary. See Dower.

DOXOLOGY, a hymn used in praise of the Almighty, and distinguished by the title of *greater* and *lesser*. The lesser doxology was anciently only a single sentence, without response, running in these words, "Glory be to the Father, and to the Son, and to the Holy Ghost, world without end, Amen." Part of the latter clause, "As it was in the beginning, is now, and ever shall be," was inserted some time after the first composition. Some read this ancient hymn, "Glory be to the Father, and to the Son, with the Holy Ghost;" and others, "Glory be to the Father in or by the Son, and by the Holy Ghost." This difference of expression occasioned no dispute in the church till the time of the Arian heresy; but when the followers of Arius began to make use of the latter as a distinguishing character of their party, it was entirely laid aside by the Catholics, and the use of it was enough to bring any one under suspicion of heterodoxy. The doxology was used at the close of every solemn office. The Western church repeated it at the end of every psalm, and the Eastern church at the end of the last psalm. Many of their prayers were also concluded with it, particularly the solemn thanksgiving or consecration prayer at the eucharist. It was also the ordinary conclusion of their sermons. The greater doxology, or angelic hymn, was likewise of much consequence in the ancient church. It began with these words, which the angels sung at our Saviour's birth, "Glory be to God on high," &c. It was chiefly used in the communion service, and in private devotions. Both the doxologies have a place in the Church of England, the former being repeated after every psalm, and the latter used in the communion service.

DRABLER, in seamen's language, a small sail or piece of canvas laced to the bonnet of a sail to give it more drop.

DRABS, wooden boxes used in saltworks for holding the salt when taken out of the boiling pan. The bottoms of the drabs are shelving or inclining, that the moisture may drain off.

DRACHMA, an ancient Greek silver coin, in value about 9¾d., or equivalent to the French franc. The weight of the Attic drachma was about 66 grains; and the Eginetan was 1⅔ of the Attic. An Alexandrian drachma weighing 126 grains has also been found. The weight called drachm, used by the modern apothecary, is equivalent to the eighth part of an ounce, or 60 grains, or 3 scruples.

DRACO, the Athenian legislator, flourished B.C. 622. See Attica.

Draco, in *Astronomy*. See Dragon.

DRACONARIUS, in *Antiquity*, a standard-bearer. Several nations, as the Persians, Parthians, and Scythians, bore dragons on their standards; and hence the standards themselves were called *dracones*, or dragons. The Romans are generally supposed to have borrowed the same custom from the Parthians; though Casaubon thinks they took it from the Daci, and Codin that they derived it from the Assyrians.

The Roman *dracones* were figures of dragons painted in red upon the flags, as appears from Ammianus Marcellinus; but amongst the Persians and Parthians they were, like the Roman eagle, figures in full relievo.

DRACONTIC MONTH, the time of the revolution of the moon from her ascending node, called *caput draconis*, to her return thither.

DRAGOMAN, or DROGUEMAN, an interpreter; a term of general use in the Levant and throughout the East. There are dragomans attached to the embassies and consulates of Christian nations residing at the Porte. The word is formed from the Arabic *targeman* or *targiman*, of the verb *taragem*, "he has interpreted." From *dragoman* the Italians formed *dragomanno*, and, with a nearer relation to its Arabic etymology, *turcimanno*; whence comes *truche-man*, as well as *dragoman* and *drogueman*.

DRAGON (Lat. *draco*, Gk. δράκων), a fabulous kind of fiery winged serpent, or nondescript creature, much celebrated in the romances of the middle ages. The dragon, in heraldry, is borne in coats, crests, and supporters. Dragon is also the name of a constellation in the northern hemisphere. See ASTRONOMY. The name *Draconidæ* is likewise applied to a genus of small Saurian reptiles.

DRAGON'S Head and Tail (*caput et cauda draconis*), are the nodes of the planets, or the two points in which the ecliptic is intersected by the orbits of the planets, and particularly that of the moon, making with it angles of 5 degrees and 18 minutes. One of these points looks northward, the moon beginning then to have north latitude; and the other southward, where she commences south. Thus her deviation from the ecliptic seems, according to the fancy of some, to made a figure like that of a dragon, whose belly is where she has the greatest latitude; the intersection representiug the head and tail, from which resemblance the denomination arises. But these points abide not always in one place, but have a motion of their own in the zodiac, and retrograde 3 minutes 11 seconds per day, completing their circle in 18 years 225 days; so that the moon can be but twice in the ecliptic during her monthly period, and at all other times she will have a latitude or declination from the ecliptic. It is about these points of intersection that all eclipses happen. They are usually denoted by these characters, ☊ dragon's head, ☋ dragon's tail.

DRAGON'S Blood, a resinous substance much used for tinging spirit and turpentine varnishes, for preparing gold lacquer, staining marble, &c. It is the produce of several trees,—as *Calamus draco*, *Dracæna draco*, *Pterocarpus draco*, &c.; and is imported from the East Indies, Africa, and South America, in dark red lumps, in rolls, and in irregular cakes. When pulverized it is of a bright red colour. Its solvents are alcohol, ether, and oils.

DRAGONNEE, in *Heraldry*, is said of a lion or other beast of which the hinder half terminates like the hinder part of a dragon.

DRAGOON, in military affairs. See ARMY.

DRAGOONING (Fr. *dragonnade*), abandoning to the rage of soldiers; one of the methods that have been used for converting refractory heretics, and bringing them within the pale of "the true church." The manner of dragooning the French Protestants, after the revocation of the edict of Nantz, under Louis XIV., is described as follows in a French work translated in 1686. "The troopers, soldiers, and dragoons, went into the Protestants' houses, where they marred and defaced their household stuff, broke their looking glasses, and other utensils and ornaments, let their wine run about their cellars, and threw about their corn and spoiled it. And as to those things which they could not destroy in this manner, such as furniture of beds, linen, wearing apparel, plate, and the like, they carried them to the market-place, and sold them to the Jesuits and other Roman Catholics. By these means the Protestants in Montaubon alone were, in four or five days, stripped of above a million of money. But this was not the worst. They turned the dining-rooms of gentlemen into stables for their horses; and treated the owners of the houses where they quartered with the highest indignity and cruelty, lashing them about from one to another, day and night, without intermission, not suffering them either to eat or drink; and when they began to sink under the fatigue and pains they had undergone, they laid them on a bed, and when they thought them somewhat recovered, made them rise, and repeated the same tortures. When they saw the blood and sweat run down their faces and other parts of their bodies, they drenched them with water, and, putting over their heads kettle-drums turned upside down, they made a continual din upon them till these unhappy creatures lost their senses. When one party of these tormenters were weary, they were relieved by another, who practised the same cruelties with fresh vigour."

DRAGUIGNAN, a town of France, capital of the department of Var, as well as of a cognominal arrondissement, situated in a fertile valley surrounded by vine and olive-covered hills. The town is tolerably well built, and is ornamented with numerous public fountains. The principal buildings are the court-house, prison, clock-tower, and hospital. Draguignan has a public library of 15,000 vols., botanic garden, natural history museum, communal college, and a society of agriculture, besides manufactures of broad cloths, silks, stockings, soap, leather, brandy, and earthenware. There are also several oil mills in the town. Pop. (1851) 8009.

DRAINAGE.

Drainage of Towns.

UNDER this head we shall commence with the drainage of towns and other inhabited places, with more particular reference to the removal and discharge of cloacal and other foul matters in a liquid state from human habitations.

We shall then notice the drainage of lands for agricultural purposes, and the drainage of fens, marshes, &c.

The first of these subjects has been already referred to in the supplement to ARCHITECTURE (vol. iii.), and the remarks made in that place may be taken as introductory to the present article. For the drainage of fields for farming operations, see also AGRICULTURE.

It was there shown that the removal of sullage by means of sub-surface sewers, whereby it has acquired the name of sewage, is of comparatively recent introduction. Towns are commonly built upon sites of which the immediate subsoil is percolable by liquids, and into which the excreta arising in and from human habitations have been dejected into cesspools formed in it; and no volatile and active gases are thrown out, under such circumstances, in quantities sufficient to produce any sensibly injurious effect upon the atmosphere. The gases which are evolved are deadly; but are comparatively innocuous while undisturbed.

Drainage of Towns.

The foulness of old towns which stand upon dry sand or gravel, or other percolable stratum of soil, may be referred rather to accumulations in and about the buildings of such corruptible animal and vegetable refuse as may not be thrown into the cesspool, and which cannot be made to pass away by drains: so that, in truth, effective scavengering is the first essential to wholesome ventilation, when excreta are dejected upon or into a soil which will absorb the liquids, and such must be the case indeed whatever system of sewering may be applied. It is not to be overlooked, nevertheless, that such soils as allow the liquid parts of excreta to pass away, do but filter them down into the water, for the sake of which, probably, the site was originally chosen, and that these liquid excreta are thus apt to reappear in the wells, and to poison one of the supports of life in another direction. But, however, disgusting this idea may be upon reflection, it does not always occur to the mind; and it is not until the close crowding together of human beings into the commonly small space which the original site of an old town comprises, that any effect really injurious to health can arise from that source; nor is it, indeed, to the source referred to that the most disgusting apprehension is traced, but to the deposit of the mortal remains of humanity within the strata from which springs of water are derived. Nor has the necessity of drainage, as a means of relieving towns of sullage, and of the exhalations consequent upon its exposure to heat and air, become recognised because of the defects of the system which retained the solids of human excreta within or immediately about the buildings in a town situated upon a bed of dry gravel, but because towns have outgrown their sites, and extended their buildings to the clay which so commonly occurs under beds of sand or of gravel. It has been seen that London has in this manner outgrown the limits of the gravel bed, and has been thrown upon the blue clay underlying the fine stratum of gravel which forms the banks and bed of the Thames in its course through London, and which comes to the surface at from one to two miles inland on each side of the river. No sooner was the clay touched by buildings, than the necessity of providing for the immediate removal of sullage became apparent; and in the endeavour to secure such removal by drainage in places where drainage is absolutely essential to allow of the occupation of the site for human habitation at all, a system deficient in a most important particular has been carried out to the serious detriment of those parts and places which had been already closely built over, and the air of which is injured more by the exhalations of the steaming sullage drain, than by anything emitted from a close cesspool dry-steined in gravelly soil.

But sewering will not supersede the necessity of scavengering, nor, indeed, if due regard be paid to the wholesomeness of the locality, ought sewering to be preferred to the dry cesspool, where a dry cesspool is available to the effect already indicated, unless provision be first made for scouring the contents away, and for removing directly to the upper air the gases which they will evolve in their passage.[1]

It is obviously esssential to the effectual relief of a town by drainage, that no building in or out of which matters requiring to be carried off by drains can arise, be built at so low a level, with reference to the eventual removal from the town of such matters, that the perfect drainage of the building cannot be effected by existing and available means of discharge; and no system of drainage can be carried out in any town lying low with reference to the outfall, unless provision be made by authority to the effect that when existing buildings cannot be otherwise fully relieved, artificial means shall be employed to relieve the low-level sewers.

It is further requisite to the effectual drainage of a town that there be such a supply of water to all buildings occupied for the purposes of life, that all matters entering their drains may be attended or be followed by water enough to carry the sullage onward without depositing in the drains, and that there be also such a supply of water to scour the main drains or sewers, either in a constant flow or in frequent and copious flushes, as will prevent the sullage from being arrested within them long enough either to deposit filth or to throw off noxious gases.

The fall of drains and sewers ought to be greater, and may be less, according to the provision available for scouring them, or of keeping up a current within them in any case. Half an inch of fall in every ten feet is the slightest permissible fall for a house-drain under the best circumstances; that is to say, when the supply of water to the house is so ample that the waste will certainly furnish a good scour therefrom; but one, two, or even three inches of fall in every ten feet in length of such a drain may be requisite when the supply of water is scanty and the waste is likely therefore to be slack.

A fall of one and a half inches in every 100 feet in length is fall enough for a main drain or common sewer when it has a well-formed and evenly-built concave bottom, and when a constant flow of water, in quantity sufficient to prevent the sullage from depositing any of its heavier matters in the sewer, may be relied upon; but the fall should be greater when mere flushes of water are to be used as a means of carrying on the sullage. As regards size, house-drains and town-drains,—or private drains and common sewers, to use the terms more commonly applied to them, —do not require to be of the large sizes of which they are usually made for the mere reception and conveyance of the sullage of the building, or of the town or district; but there are sufficient reasons why they should be made larger respectively than would be sufficient for those purposes alone.

It is a good general rule in all matters relating to constructions, that every part of any work liable, in its use, to derangement from any cause, be made accessible for the purposes of repair or of renewal. This rule ought to be especially adhered to in all matters relating to the drainage of buildings; whether it be of water, as liable to affect the structure, or of sullage, as liable to affect the health and comfort of the inhabitants; and what is true of a building is true of aggregations of buildings in a town.

But, in providing for easy access to whatever pipes and drains may occur inside a building, the arrangements to secure that object should be made in such manner as to occasion the smallest possible amount of inconvenience within the building whenever occasion may arise for employing them. And in like manner, as it regards the connexion of private or house drains with the main drains or sewers,—and as to the building and the repair of the sewers themselves, indeed,—arrangements should be devised to such effect that all such works may be executed without interfering, or with the smallest possible amount of interference, with any public way, or with the convenience of the public in the use of the public ways.

In providing for the relief of any place from superfluous waters, the first thing to be secured is an outfall or place at which they may be discharged, or otherwise so disposed of that they shall not return. An outfall must, therefore, be at a lower level than the place to be relieved, but it may be either natural or artificial. A country like Holland, or a place like the Isle of Dogs, east of London—the one fronted by a tidal ocean, and the other almost girt around

[1] In coal countries, where ash and cinder arise in large quantities in even the poorest dwellings, and go to the ash-pit or dust-bin with animal and vegetable refuse, and excreta, the injury to the air of the locality from defective scavengering is not so great as it is in London, and other towns where coal is dear, and ash and cinder therefore scanty.

by a tidal river—finds natural vent for its superfluous waters at intervals, though at the expense of artificial works, and subject to whatever inconvenience may arise from the retention of the waters during the intermediate periods. The outfalls obtained in these cases are not such as would be chosen when better are obtainable, nor would such be rejected when they present themselves at a level available to the relief of the surface of a site, although they may not be at a level low enough to relieve subterranean conduits of whatever they may contain.

An outfall being obtained, whether it be natural or artificial, means are to be devised for collecting the liquid waste and bringing it together to the outfall for discharge. If this be so much below the level of the area to be relieved as to allow of fall enough in channels or other conduits,—and the receptacle at the point of discharge be such as to allow of such disposal,—the waste waters may be permitted to carry with them not only matters in solution, as culinary and cloacal refuse from the dwellings of men, but even the muddy washings of the streets of a town. If, however, the available outfall be not so low, or the eventual receptacle be not of such a character as to admit matters liable to deposit silt, prudence will dictate the propriety of keeping the foul matters, though solved in water, from becoming entangled with what may check their course to the outfall, and providing for the removal of the comparatively clean, though heavy dirt, being the street washings, by another channel. That is to say, a town situated on high ground and near, for instance, to the sea, may be relieved of its surface waters, the washings of its streets, and its sullage, being its cloacal refuse, kitchen and washing waste, by the same sewers without any inconvenience, and consequently at less cost than a town can be relieved of its waste under other and less advantageous circumstances, in respect of relative level of outfall and area to be relieved. In the case last supposed, a single system of sewers may suffice; but in the other case a double system ought to be formed, that the heavy and insoluble washings of the street may not mingle with and delay the solved and soluble domestic refuse.

Taking the more difficult case of a town of which the available outfall for its sullage is low with relation to the general area, the question naturally presents itself, what rate of fall is sufficient to secure relief, in the particular case contemplated, by or through the given outfall? And the obvious answer is, that the rate must depend upon the degree of fluidity of the sullage, and the condition as to smoothness or otherwise of the surface over which it is to run. Tar or treacle will not run so fast upon a surface of glass as oil will travel over a surface of lead laid at the same inclination; and water will make its way over a rough surface of brickwork laid with a like fall more rapidly than either of the viscid liquids can travel over the smoother surfaces assigned to them. The rate of inclination proper for drains or other conduits for the ready relief of a town of its liquid waste depends, therefore, firstly, upon the degree of fluidity of the waste, and, secondly, upon the condition as to smoothness of the surface over which it is to make its way to the outfall. Hence the objects to be aimed at when the outfall is bad, that is to say, high with reference to the area to be relieved, are to bring the waste as nearly as may be to the condition as to fluidity of unclogged water, and to provide drains the inside surface of which shall offer the least possible degree of resistance to the fluid by roughnesses or inequalities of surface, especially as regards the transverse section of the drain. It is to be borne in mind, at the same time, that although the fluidity of waste water, bearing sullage in solution, cannot be too perfect, having regard to the more effectual removal of the solved foul matters, the rate of fall may be too great for the conduits, whether they are open channels or covered drains. Open channels may be overfilled by a too rapid backwater, and the sullage run over before it has time to reach the outfall, as rivers are apt in their lower reaches to overflow by flushes of water coming into them too rapidly from their upper and more steeply inclined reaches; whilst in the case of barrelled or tunnelled drains, the sullage will be choked back to its source when the structure of the drains is strong enough to resist the pressure of the head that may be formed, or, the structure being weak the drain gives way, and a filthy bog is formed. Subterranean *built* drains, whether large or small, when they are well built of brick or stonework, and of substance enough to withstand the pressure of the ground about them, are generally found to be strong enough to resist whatever head may be formed by backwater hurrying down from upper reaches; but drains composed of pipes of pottery, or other substance strong enough, it may be, to bear the pressure of the ground, are weak at the joints, which commonly give way to a comparatively slight head of water acting within the drains, in which case the soil in which the pipes are laid is softened by the ejected liquid, the joints are drawn, and the above-stated result follows. But every part in the length of a drain is lower than the part above, and is liable, therefore—irrespective of obstructions arising from the casual presence within the drain, in any part below, of foreign and uncontemplated substances—to be exposed to pressure from a head of backwater sufficient to destroy a weakly-built drain, or a pipe drain of which the joints are so weak as to be unable to withstand the pressure of a head equal to that of the overflow level at which relief may be obtained. But such relief to the insufficient or ill-disposed drain is purchased by the inhabitants of the place at which the overflow may occur at too high a price in annoyance to be suffered; and to avoid this contingency, all drains ought to be made large enough in every part to give free passage onwards, and to the eventual outfall, of everything that can pass into them under the most exigent circumstances possible in any case. And this consideration is irrespective again of that which regards the larger drains or common sewers under public ways, or near to heavy buildings, or elsewhere, at a great depth in the ground, which are with great advantage made larger than their purposes as conduits for waste waters might require them to be made, that there may be roomy access within them for workmen to form inlets from branches, to amend possible defects in the structure, or to remove casual obstructions.

It often happens that, as in the cases of much of the area of Holland, and all the Isle of Dogs before alluded to—except, indeed, as to the sea and the river walls or embankments respectively—the waste waters accruing within the area to be relieved between half, or even three-quarters ebb, and quarter or half flood of the tide in either sea or river, must be penned back in the sewers, or be lifted out by artificial power applied through pumps; and under such circumstances it is most important that nothing that can be deposited by the still waters should pass into the sewers. For in such case, it is no longer a removal of casual obstructions that has to be provided for, but a certain and often-recurring necessity of sending labourers into the sewers to collect and remove deposits which must always be foul, having regard to the company into which, when suspended, they had travelled, and always, therefore, offensive, and probably noxious upon being disturbed. No mere run of backwater as a scour will remove such deposits, even if they are mere slime; but when they consist, as they commonly do of grit and cementitious matter, they are apt to form a concrete that cannot be removed except by means which act upon the substance of the sewer itself, and tend to wear it out. The nidus of slime in sewers is soap-suds, a waste that must be allowed to pass by house drains, and so into and by the sewers; but it is only under the circumstance first above supposed that the washings of the streets of a town ought to be permitted to pass into the sullage drains

Drainage of Towns.

and sewers at all. It seems certain, therefore, that as a rule, the drainage of towns should be effected by a double system of drains—one part applied to the surface drainage being the rainfall upon the roadways, carrying with it the not necessarily offensive, but heavy and insoluble silt, the result of the wear and tear of the road material, and the droppings of graminivorous animals used in the service of man—and the other part devoted to the relief of the particular habitations of men of liquid refuse, and matters soluble in water, but commonly offensive, and capable of becoming noxious, and requiring, moreover, to be led to points of discharge at or from which they may be dissipated. When a single system adapted to the former purpose only has been extended so as to include the latter, and a whole town has become inextricably involved in the vicious mesh, the best that can be done is to lead the commingled silt and sullage together to points of temporary lull, where the sand, the heaviest part of the silt, may deposit, and to draw off or pump out, as the case may require, and lead to the eventual points of discharge, the liquid sullage over it.

The practice of drainage, so far as regards the structure of sewers and drains, is mere matter of construction, and is both simple and easy. Drains as structures may be divided into three classes—the tunnel sewer drain, the barrel drain, and the pipe drain. There are varieties of each class, and the classes continually blend one into another, but the classes are, nevertheless, sufficiently distinct for general description.

The tunnel sewer is built of brick-work or of masonry, cylindrical or of some conic section in form transversely, and of such size that men may pass into and through it. The barrel drain, smaller in size than the tunnel, is in like manner *built*, and the best and most available form is the egg shape, with the small end downwards. The pipe drain is formed of pipes or tubes laid together in short lengths, various expedients being employed for connecting the pipes by their ends.

The tunnel sewer (and by the term tunnel a drifted or tunnelled work is not necessarily implied) though simple in its form and of easy construction, is an important work of hydraulic architecture, and as such must be dealt with as a construction requiring to be laid or placed evenly upon a well-resisting foundation, and to be either sustained within itself as a bridge or as a church must be, or be so laid in the ground that it shall be pressed upon in every direction with reference to the power its form and the mode of construction employed may give it of resisting pressure for the security of its own structure.

The barrel drain must be laid, in like manner, on an unyielding foundation, and be so placed within and under the ground that the pressure upon it shall act in every direction alike.

What is above referred to as a pipe drain, may be a constructed barrel drain of the smallest size that can be built with brick in the form of a cylinder; but brick-built drains of small size, that is to say, of less than fourteen or fifteen inches internal diameter, will not be employed when pot-pipe of fitting kind and quality can be obtained, unless the drain is near the surface, and under a roadway exposed to heavy carriage traffic.

The use of tubes or pipes of pottery for drains is by no means new, but the removal of cloacal refuse from the habitations of man by underground conduits, whether as pipes or otherwise, is of recent introduction into the general service of towns; and of all the devices hitherto recurred to for such purpose there is none equal to pot-pipe rendered inabsorbent by glazing. Such pipes may be made of sufficient strength to resist the dead pressure of the ground in which they are, for the most part, laid up to a bore of twelve or fifteen inches in diameter, and they may be and are made, with ease and economy, in lengths of about two feet, which length, indeed, cannot be much exceeded in practice. Elongated drains of pot-pipe involve, therefore, a multiplicity of joints; and as pot-pipe drains, as well as brick-built drains, are exposed to the intrusion of uncontemplated substances which tend to obstruct the free passage through them of legitimate matters, whilst pottery is very liable to be broken even in the laying and under the process of filling in over them, it has been sought to make the joints in such manner that they shall be water-tight, and at the same time easily opened and easily re-made. The common practice is to make them spigot and faucet fashion, or socketted, in rough resemblance to the jointing of a flute, one end of every length of pipe being widened out into a faucet or socket, and the other adapted to run into the socket, as the spigot does into the faucet, the hollow way being preserved when the joint is made. Such a joint in pot-pipes must be a loose one, and therefore not water-tight; and if it be packed with a cementitious mortar, the adhesion of the mortar will prevent the separation of the parts when occasion requires it, whilst in the rough workmen's hands the mortar is often pressed into the pipes, and dries into a hard and obstructive ridge, where the way should be smooth and free throughout. Mere plastic clay is used therefore to pack the joints, it being a substance easily softened and broken down into mud by the passing liquids; but it is also so weak against any force, that if from any cause a head of water or other liquid is formed within a socketted pipe drain, the clay soon gives way, the joints are, in technical phrase, *blown;* and the liquid is not merely let out, it is driven out into the soil in which the pipe is embedded. But, as it has been already intimated, pot-pipe is liable to be broken in laying the pipes—the liability arising mainly out of the process of punning or ramming the ground in, about, and over the pipes, after they have been placed and the joints formed. The consciousness of this liability, and of the equally mischievous result of ramming over and about such a structure as a pot-pipe drain laid in the usual manner in and on the naked earth, leads to a mere filling in of the earth about the pipes, and over them to such a depth that the rammer cannot be felt through the bed of earth, unless it be felt through the agency of a piece of gravel or a spall of hard stone casually dropped in over a pipe, by which from the blow above, a hole may be punched in the pipe, or the pipe broken throughout, and in either case the newly-formed drain is choked up, and made worse than useless. The more common case, however, is the blowing of the clay-stopped joints and the softening of the loosely packed soil about the drain, when the pipe sinks at the loosened joint, which is thus drawn, and the drain is a drain no longer. It is to be repaired—the floor must be taken up if the course of the drain is within a building, or the pavement above it if out of doors; and the ground is to be dug out along the line, until the point of failure be reached. The already loosened lengths of pipe are pulled asunder, or broken up if the small ends have been run too well up in the sockets, the penned-back filth in the upper reach obtains vent, and it is either allowed to go on by the hitherto unobstructed lower reach, carrying with it all of the sodden clay that it can render liquid enough to flow, or the filthy bog is baled out and carted away. The pipes have now to be relaid; but, as the joints are socketted, it is physically impossible to make good (as it is technically termed) without beginning at the beginning and taking up all the pipes above the *fault* to get lengths enough in again. Relaid in the same manner, the structure is liable to the same occurrence again and again; and whether the pipes are large or small, if they are no larger in the bore than barely suffices for the passage of the calculated waste, pipe drains laid upon naked and soluble soil—the commonest kind of soil—and jointed with soluble material, are all liable to the casualties above described

Drainage of Towns.

The foregoing observations have reference to one great defect in the pot-pipe system of drainage, but that one is in all essential particulars the result of a mistaken aim at cheapness. Pottery, like all other substances produced by or under the action of heat, is most liable to be defective at such parts of the thing produced as are larger in any particular direction. Socketted cast-iron pipes are liable to be unsound in the sockets where the metal is of different and unequal thickness and the body of greater extent in circumference, because of the unequal cooling of the metal; and socketted pot-pipes are liable to be unsound in the sockets, because the whole body of the pipe cannot, because of the socket, expand and again cool simultaneously throughout. Simple hollow cylinders, whether of iron or of pottery, are more likely, with the same care in the manufacture, to be sound, than socketted pipes of either substance; and for this reason, if for no other, pot-pipes should be simple hollow cylinders, and some other expedient ought to be employed for making the joints than that by which the pipe is liable to be rendered both unsound in its manufacture, and impracticable when the work requires to be repaired. Expedients have been devised to this effect, and are gradually making their way into use;[1] while, at the same time, the mischievous influence of a bad practice is shown by that which is immediately superseding it—the practice of cutting off half the round of the socket, so that any one length of pipe may indeed be taken up and relaid without disturbing any other length, but the effect of the operation upon the pipe is that the part of the socket remaining detracts more than the whole socket does from the soundness of the structure of the pipe, and the upper half of every joint remains uncovered.

But the soundest pipes jointed in the soundest manner will not produce a sound and certainly effective drain without truth and stability in the construction of the drain.

The exclusive advocates of pot-pipe drains, which they endeavour to distinguish by the term tubular, stigmatize brick-built drains as sewers of deposit. This, however, is absurd, since the same cause which renders brick-built drains occasionally faulty in their course does the same by the pipe drain, with this difference against the latter, that whereas the brick-built drain is of the same kind of structure throughout, and strong enough to bear the rude process of filling in, and is essentially larger than the pipe, whereby a deposit in a casually depressed part is not necessarily an impracticable obstruction to the course of the drain, nor is a head of water above such a defect the certain means of destroying it. The pipe is laid in lengths—weak in the joints—both weak and fragile in its structure, and liable to the defects above described when defectively constructed. But all that either brick-built sewers or pot-pipe drains require, when good materials and skilful workmanship are employed, to make sound, effective, and trustworthy conduits, free alike from liability to be choked or blown by water or by liquid waste, are an unyielding and even foundation, a firm seat, and truth in the setting of the work. All this is easily attainable, and is commonly attained in the modern practice of building sewers of brickwork. The broader base afforded by brickwork will find a resisting foundation upon a soil into which a mere pipe of the same internal capacity would sink; and a brick structure will bear the ground to be forced in around and above it by a process that pot-pipes of the strongest make may not be exposed to. But if, instead of a false economy under the name of cheapness, true economy be embraced, the trench in which a pipe drain is to be laid will be dug out from six to twelve inches deeper than is required for the drain, and a layer of concrete of that thickness, and of the full breadth of the trench, placed in it, and formed with the fall required for the inside of the drain. This can be done under the eye, and will be open to the correction, of the supervisor, as in building a brick-drain; and the pipes may be laid, and the joints formed, upon the firm and evenly laid concrete with truth and certainty, even though the joints be socketted. Concrete being filled in under and about the pipes when so laid, up to half the diameter of the round body, the ground may be filled in over the drain, with confidence that it will possess the great requisites of truth and strength, with the peculiar excellence which the pipe possesses of smoothness of surface in the run of the drain. A pipe drain so laid will not be *cheaper* than a drain of the same size of brickwork; but it will be strong against everything short of crushing pressure. Light weight *is* crushing pressure to pot-pipes, however, and pipes of pottery may not, therefore, be laid under carriage roads, nor anywhere else, indeed, of such large size as to break under any dead weight that can come upon them, or under any impact to which they may be exposed. The strength of the strongest pottery pipes is, nevertheless, but weakness as compared with the thinnest brickwork in tubular drains.

In fine, with careful workmanship and a good foundation, either brick and mortar, or sheet-iron collared pipes, will make a good, lasting, and serviceable drain; whilst with careless or bad workmanship, and an infirm bed, a brick drain *may* be bad, but a pipe drain under the same circumstances *must* be so.

But the best built and best laid and jointed sewers and drains, of whatever materials or however put together, and with the best outfall, are but the means by which the *material* parts of cloacal and other foul refuse in a liquid state are made to pass away; the *immaterial* parts are not thereby ejected. The hot waste-water of the scullery helps, by diluting it, to hurry on the more sluggish matters which enter the same drain from the cloaca; but the heat in the culinary waste not only throws off in a gaseous form, and often enveloped in steam, the sickening odour which the water has taken out of the esculents boiled in it, but it induces the evolution of faint but foul gases from the cloacal filth itself, and these rise and run back to the highest attainable level, and seek egress into the upper air. This is commonly obtained through some faulty sink, or by crannies in the drain within the house from which the matters had proceeded, the escape being aided powerfully by the kitchen, and in winter time by the focal, fires; and in the streets of sewered towns the reeking stench rises through gully gratings; or if these are effectually trapped, then through holes made for the purpose in the carriage-roadway, where, however, they are very commonly clogged up with road stuff, which now and then drops down into the sewer, and forms an obstruction to the turbid stream there. By some or other of these vents, however, the stench escapes from drains and sewers, rises and mingles with the air, to be again inhaled by human beings. And thus it is that the air is circulated and the sewers ventilated in our best sewered towns!

Now, the course proper to be pursued is almost the reverse of that commonly practised, from which the inhabitants of sewered towns suffer in comfort and in health, more perhaps than the inhabitants of unsewered towns, in which there is commonly no such concentration of foulnesses. Give freedom to the foul gases of the drains, as freedom is given to the air which has served the purposes of combustion in the

[1] The best expedient known to the present writer is one recently patented by Mr Jennings, a London manufacturer. Mr Jennings makes the pipes simple hollow cylinders, and lays their ends upon half-round chairs, and covers the joint with a half-round saddle which completes the circuit. The chair and saddle are both rebated, and form together a short length of pipe. Much depends upon the strength and soundness of the chair; but these qualities being secured, the joints may be made upon them in mortar with confidence. This is better than the sheet-iron collar which the writer has heretofore advocated.

Agricultural Drainage.

chimney-grate. Make a flue for the foul air of the drain of every house, at or near to its upper end, as a flue is made for the escape of the burnt air of the smokeless coke or charcoal fire, as well as for the combined burnt air and dirty, but harmless, smoke of the coal fire to pass off by, and both will alike rise into the upper air, to be dissipated by the winds of heaven and prepared by nature's chemistry to reappear as the course of nature prescribes.

A lofty shaft built at the head of every main line of sewer, and provided with the means of securing an up-draught through the shaft—means to which the wind will always give effect in even the stillest weather—would give vent to all the emanations which arise in the sewer itself; but to assure this result there must be no trapping or flapping of the inlets to the sewer—the air must be allowed to pass down freely, which it will do, firstly, by its own gravity, and, secondly, by the draught established in the sewer by the upper draughting shaft and by the house drain flues. But the mechanical details involved in the practice of drainage is matter for technical and professional consideration.

The frequent and careful removal of all dirt and filth from the surfaces of the streets by scavengering—the constant flow to an efficient outfall in subdrains of all liquid waste and foul matters soluble in water, and rendered fluid by a copious backwater, may make and keep a town clean; but neither a town as a whole, nor any place in a town,—be it palace or cottage,—can be sweet and wholesome unless the drains and sewers are swept by constant currents of air, or, in other words, thoroughly ventilated from the lower into the upper air.—The metropolis of the British empire, the home of the Sovereign, the seat of the Legislature, the place of birth and the constant residence of more than a million and a half of human beings who consider themselves high in the scale of civilization, is but indifferently scavengered, is drained and sewered upon a wholly defective system, and its drains and sewers reek with filth and pour out under our nostrils foul air for want of legitimate outfalls for the one, and elevated outlets for the other.[1] (W. H—G.)

AGRICULTURAL DRAINAGE.

To drain land is to rid it of its superfluous moisture. The rivers of a country with their tributary brooks and rills are the natural provision for removing the rain water which either flows directly from its surface, or which, after percolating through porous strata to an indefinite depth, is again discharged at the surface by springs. The latter may thus be regarded as the outlets of a natural underground drainage. This provision for disposing of the water that falls from the clouds is usually so irregular in its distribution, and so imperfect in its operation, that it leaves much to be accomplished by human labour and ingenuity. The art of the drainer accordingly consists—

1st, In improving the natural outfalls by deepening, straightening, or embanking rivers; and by supplementing these, when necessary, by artificial canals and ditches; and,

2d, In freeing the soil and subsoil from stagnant water, by means of artificial underground channels.

Trunk drainage.

The first of these operations, called *trunk drainage*, is the most needful; for until it be accomplished there are extensive tracts of land, and that usually of the most valuable kind, to which the secondary process either cannot be applied at all, or only with the most partial and inefficient results. Very many of our British rivers and streams flow with a sluggish and tortuous course through valleys of flat alluvial soil, which, as the coast is approached, expand into extensive plains, but little elevated above the level of the sea. Here the course of the river is obstructed by shifting shoals and sand banks, and by the periodic influx of the tides. The consequence is, that immense tracts of valuable land are at all times in a water-logged and comparatively worthless state, and on every recurrence of a flood are laid entirely under water. In a preceding volume (see AGRICULTURE) some account has already been given of the extent of this evil, and of the efforts that have been successfully devoted to its remedy. Some of these fen-lands and estuary drainage works have been accomplished in the face of natural obstacles of the most formidable character, and constitute trophies of engineering talent of which the country may well be proud. Great as the natural difficulties are which have to be encountered in such cases, there are others of a different kind which have often proved more impracticable. It has been found easier to exclude the sea and restrain land-floods, than to overcome the prejudices and reconcile the conflicting interests of navigation companies, commissioners of sewers, owners of mills, and landed proprietors. Although all these classes suffer the most serious losses and inconveniences from the defective state of many of our rivers, yet it is found extremely difficult to reconcile their conflicting claims, and to allocate to each their proper share of the cost of improvements by which all are to benefit. A most interesting and instructive illustration of the urgent necessity for improving the state of our rivers, of the difficulties to be encountered in doing so, and of the incalculable benefits thus to be obtained, has been published in an essay on Trunk Drainage by John Algernon Clarke, Esq., published in vol. xv., part 1st, of the *Journal of the Royal Agricultural Society of England.* Mr Clarke, after some most important observations on trunk drainage, describes in detail works projected under powers granted in an act of parliament, passed in 1852, "constituting commissioners for the improvement of the river Nene and the navigation thereof."

There is not a district of the kingdom in which works similar in kind are not absolutely indispensable, before extensive tracts of valuable land can be rendered available for profitable cultivation by means of underground drainage. It is interesting to know that the necessity for trunk drainage, and the means of accomplishing it, were distinctly set before the public 200 years ago by a practical draining engineer, to whose writings the attention of the agricultural community has been frequently directed of late by Messrs Parkes, Gisborne, and others. From the third edition (1652) of *The Improver Improved*, by Walter Blithe, the author referred to, in which the true principles of land drainage are stated as distinctly, and urged as earnestly, as by any of our modern writers, we here quote the following remarks:—

"A strait watercourse, cut a considerable depth, in a thousand parts of this nation, would be more advantageous than we are aware of, or I will task myself here to dispute further. And though many persons are interested therein, and some will agree, and others will oppose; one creek lyeth on one side of the river, in one lord's manor, and another lyeth on the other side, and divers men own the same; why may not one neighbour change with another, when both are gainers? If not, *why may they not be compelled for their own good, and the commonwealth's advantage?* I daresay thousands of acres of very rich land may hereby be gained, and possibly as many more much amended, that are almost destroyed; but a law is wanting herein for the present, which I hope will be supplied if it may appear advancement to the public; for to private interests it is not possible to be the least prejudice, when every man hath benefit, and each man may also have an equall allowance if the least prejudiced.

"But a word or two more, and so shall conclude this chapter—and

[1] This is not the first time that the writer of this article has called attention to the means above indicated of ventilating house drains and common sewers respectively. In evidence before the State of Large Towns Commission in 1843, in his joint report under the preliminary Inquiries Act in 1847—in his "Guide to the proper Regulation of Buildings in Towns, otherwise Healthy Houses," in 1848–49—and in his place as a Metropolitan Commissioner of Sewers in 1852–53, he has earnestly urged the necessity of ventilation as applied to drains and sewers, and pointed out the means above indicated of effecting it.

Agricultural Drainage.

it is a little to further this improvement through a great destruction (as some may say); it is the removing or destroying of all such mills, and none else, as drown and corrupt more lands than themselves are worth to the commonwealth, and they are such as are kept up or dammed so high as that they boggyfie all the lands that lye under their mill-head. Such mills as are of little worth, or are by constant great charges maintained, I advise to be pulled down; the advance of the land, when the water is let run his course, and not impounded, will be of far greater value many times. But in case the mills should be so necessary and profitable too, and far more than the lands they spoil, I shall then advise, that under thy mill-dam, so many yards wide from it as may prevent breaking through, thou make a very deep trench all along so far as thy lands are putrefied, and thereinto receive all the issuing, spewing water, and thereby stop or cut off the feeding of it upon thy meadow, and carry it away back into thy back-water or false course, by as deep a trench, cut through the most low and convenient part of thy meads. But put case that thou shouldst have no convenient fall on that side thy mill-dam, then thou must make some course, *or plant some trough under thy mill-dam*, and so carry it under into some lower course that may preserve it from soaking thy meadows or pastures under it; and by this means thou maist in a good measure reduce thy land to good soundness, and probably wholly cure it, and preserve thy mill also."

It is painful to reflect, that after the lapse of two centuries, we should still see, as Blithe did, much "gallant land" ruined for want of those draining operations which he so happily describes.

Underground draining.

A clear outfall of sufficient depth being secured, the way is open for the application of *underground draining*. And here it may be proper to state, that there is very little of the land of Great Britain naturally so dry as not to be susceptible of improvement by artificial draining; for land is not in a perfect condition with respect to drainage, unless all the rain that falls upon it can sink down to the minimum depth required for the healthy development of the roots of cultivated crops, and thence find vent, either through a naturally porous subsoil or by artificial channels. Much controversy has taken place as to what this minimum depth is. Suffice it to say, that opinion is now decidedly in favour of a greater depth than was considered necessary even a few years ago, and that the best authorities concur in stating it at from three to four feet. There are persons who doubt whether the roots of our ordinary grain or green crops ever penetrate to such a depth as has now been specified. A careful examination will satisfy any one who makes it that minute filamentary rootlets are sent down to extraordinary depths, wherever they are not arrested by stagnant water. It has also been questioned whether any benefit accrues to crops from this deep descent of their roots. Some persons have even asserted that it is only when they do not find food near at hand that they thus wander. But it must be borne in mind that plants obtain moisture as well as nourishment by means of their roots, and the fact is well known that plants growing in a deep soil resting on a porous subsoil seldom or never suffer from drought. It is instructive, too, on this point, to observe the practice of the most skilful gardeners, and see the importance which they attach to trenching, the great depth at which they often deposit manure, and the stress which they lay upon thorough drainage. On the other hand, it is well known that soils which soonest become saturated, and run from the surface in wet weather, are precisely those which parch and get chapped the soonest in drought. The effectual way to secure our crops at once from drowning and parching, is to put the land in a right condition with respect to drainage.

All soils possess more or less the power of absorbing and retaining water. Pure clays have it in the greatest degree, and gritty siliceous ones in the smallest. In dry weather this power of attracting moisture is constantly operating to supply from below the loss taking place by evaporation at the surface. In heavy rains, as soon as the entire mass has drunk its fill, the excess begins to flow off below; and therefore a deep stratum, through which water can percolate, but in which it can never stagnate—that is, never exceed the point of saturation—is precisely that in which plants are most secure from the extremes of drought and drowning.

If a perfect condition of the soil with respect to drainage is of importance for its influence in preserving it in a right condition as respects moisture, it is still more so for its effects upon its *temperature*. All who are conversant with rural affairs are familiar with that popular classification of soils in virtue of which such as are naturally dry are also invariably spoken of as *warm* and *early*; and conversely, that wet soils are invariably described as being *cold* and *late*. This classification is strictly accurate, and the explanation of it is simple. An excess of water in soil keeps down its temperature in various ways. In passing into the state of vapour it rapidly carries off the heat which the soil has obtained from the sun's rays. Water possesses also a high radiating power; so that, when present in the soil in excess, and in a stagnant state, it is constantly carrying off heat by evaporation and radiation. On the other hand, stagnant water conveys no heat downwards; for, although the surface is warmed, the portion of water thus heated being lightest, remains floating on the surface, and will give back its heat rapidly to the atmosphere, but conveys none downwards. When the surface of stagnant water becomes colder than the general mass, the very opposite effect immediately ensues; for as water cools its density increases, and thus causes an instant sinking of the portion that has been cooled, and a rising of a warm portion from below to take its place—this movement continuing until the whole has been lowered to 42°, at which point water reaches its maximum density, after which it will freeze at the surface if the cold be great enough. It is thus that soil surcharged with water is kept at a lower temperature than similar soil that has a sufficient natural or artificial drainage.

But while the presence of stagnant water in a soil has this injurious power of lowering its temperature, a very different effect ensues when rain-water can sink freely into it to a depth of several feet, and then find a ready exit by drainage; for in this case the rain-water carries down with it the heat which it has acquired from the atmosphere and from the sun-heated surface, and imparts it to the subsoil. There is as yet a lack of published experiments to show the ordinary increase of temperature at various depths and in different soils, as the result of draining wet land. Those conducted by Mr Parkes, in a Lancashire bog in June 1837, showed, as the mean of 35 observations, that the drained and cultivated soil at 7 inches from the surface was 10° warmer than the adjoining undrained bog in its natural state at the same depth. It is understood that recent experiments conducted by the same gentleman on an extended scale fully establish the fact that an increased temperature of the soil is an unfailing accompaniment of thorough draining. The importance of this result cannot well be overrated. The temperature and other conditions of the atmosphere, which we call climate, are placed beyond human control; but this power of raising the temperature of all wet, and consequently cold soils, becomes tantamount in some of its results to a power of improving the climate. There are, accordingly, good grounds for stating that in numerous cases grain crops have ripened sooner by 10 or 12 days than they would have done but for the draining of the land on which they grew.

The points which we have thus briefly touched upon are so essential to an intelligent appreciation of the subject, that we have felt constrained to notice them, however meagrely. But our space forbids more than a mere enumeration of some of the many evils inseparable from the presence of stagnant water in the soil, and of the benefits that flow from its removal. Wet land, if in grass, produces only the coarser grasses, and many sub-aquatic plants and mosses, which are of little or no value for pasturage; its herbage is late of

Agricultural Drainage.

coming in spring, and fails early in autumn; the animals grazed upon it are unduly liable to disease, and sheep, especially, to the fatal rot. When used as arable land, tillage operations are easily interrupted by rain, and the period always much limited in which they can be prosecuted at all; the compactness and toughness of such land renders each operation more arduous, and more of them necessary than in the case of dry land. The surface must necessarily be thrown into ridges, and the furrows and cross-cuts duly cleared out after each process of tillage, on which surface expedients as much labour has probably been expended in each thirty years, as would now suffice to make drains enough to lay it permanently dry. With all these precautions, the best seed-time is often missed, and this usually proves the prelude to a scanty crop, or to a late and disastrous harvest. The cultivation of the turnip and other root crops, which require the soil to be wrought to a deep and free tilth, becomes either altogether impracticable, and must be abandoned for the safe but costly bare fallow, or is carried out with great labour and hazard; and the crop, when grown, can neither be removed from the ground, nor consumed upon it by sheep without damage by poaching. The dung, lime, and other manure, that is applied to such land, is in a great measure wasted; and the breaking of the subsoil and general deep tillage, so beneficial in other circumstances, is here positively mischievous, as it does but increase its power of retaining water. Taking into account the excessive labour, cost, and risk, inseparable from the cultivation of wet land, and the scanty and precarious character of the crops so obtained, it would in many cases be wiser to keep such lands in grass, than to prosecute arable husbandry under such adverse circumstances. These very serious evils can either be entirely removed, or, at the least, very greatly palliated by thorough draining. It often happens that naturally porous soils are so soaked by springs, or so water-logged by resting upon an impervious subsoil, or, it may be, so drowned for want of an outfall in some neighbouring river or stream, that draining at once effects a perfect cure, and places them on a par with the best naturally dry soils. In the case of clay soils, the improvement effected by draining is in some respects greater than in any other class, but still it cannot change the inherent properties of clay. This has sometimes been overlooked by sanguine improvers, who, hastily assuming that their strong land, when drained, would henceforward be as friable and sound as the more porous kinds, have proceeded to treat it on this assumption, and have found to their cost that clay, however well drained, will still get into mortar and clods, if it is tilled or trodden on too soon after rain. It is entirely owing to such rash and unskilful management that an opinion has sometimes got abroad that clay lands are injured by draining. They merely retain the qualities peculiar to clay; and when they are treated judiciously, show as good a comparative benefit from draining as other soils. The only instances in which even temporary injury arises from draining is in the case of some peaty and fen lands, which are so loose, that they suffer from drought in protracted dry weather. As such lands are usually level and have water-courses near them, this inconvenience admits of an easy remedy by shutting up the main outlets and then admitting water into the ditches. The drains in this way become ready channels for applying the needed moisture by a kind of subterraneous irrigation.

The beneficial effects of thorough draining are of a very decisive and striking kind. The removal of stagnant water from a stratum of 4 feet in depth, and the establishing of a free passage for rain-water and air from the surface to the level of the drains, speedily effects most important changes in the condition of the soil and subsoil. Ploughing and other tillage operations are performed more easily than heretofore, in consequence of a more friable state of the soil. Moderate rains which formerly would have sufficed to arrest these operations do so no longer, and heavy falls of rain cause a much shorter interruption of these labours than they did when the land was in its natural state. Deep tillage, whether by the common or subsoil plough (which formerly did harm), now aids the drainage, and is every way beneficial. Ridges and surface furrows being no longer needed, the land can be kept flat with great benefit to crops, and furtherance to field operations. An earlier seed-time and harvest, better crops, a healthier live stock, and an improved style of husbandry, are the usual and well known sequents of judiciously conducted drainage operations. In short, the most experienced and skilful agriculturists now declare with one consent that good drainage is an indispensable preliminary to good cultivation.

Antiquity of land draining.

Although it has been reserved to the present times to see land draining reduced to a system based on scientific principles, or very great improvement effected in its details, it is by no means a modern discovery. The Romans were careful to keep their arable lands dry by means of open trenches, and there are even some grounds for surmising that they used covered drains for the same purpose. Indubitable proof exists that they constructed underground channels by means of tubes of burned earthenware; but it seems more probable that these were designed to carry water to their dwellings, &c., than that they were used simply as drains. Recent inquiries and discoveries have also shown that it is at least several centuries since covered channels of various kinds were in use by British husbandmen for drying their land. It is, at all events, two centuries since Capt. Walter Blithe wrote as follows:—

Blithe's treatise, 1652.

"Superfluous and venomous water, which lyeth in the earth and much occasioneth bogginesse, mirinesse, rushes, flags, and other filth, is indeed the chief cause of barrenesse in any land of this nature. . . . Drayning is an excellent and chiefest means for their reducement; and for the depth of such draynes, I cannot possibly bound, because I have not time and opportunity to take in all circumstances. . . . And for thy drayning trench it must be made so deepe that it goe to the bottome of the cold, spewing moyst water, that feeds the flagg and the rush; for the widenesse of it, use thine owne liberty, but be sure to make it so wide as thou mayest goe to the bottome of it, which must be so low as any moysture lyeth, which moysture usually lyeth under the over and second swarth of the earth, in some gravel or sand, or else, where some greater stones are mixt with clay, under which thou must goe halfe one spades graft deepe at least; yea, suppose this corruption that feeds and nourisheth the rush or flagg should lie a yard or foure foot deepe, to the bottome of it thou must goe, if ever thou wilt drain it to purpose. . . . And for the drayning trench be sure thou indeavour to carry it as neare upon a straight line as possible. . . . To the bottome where the spewing spring lyeth thou must goe, and one spades depth or graft beneath, how deep so ever it be, if thou wilt drayne thy land to purpose. I am forced to use repetitions of some things, because of the suitableness of the things to which they are applyed; as also because of the slownesse of peoples apprehensions of them, as appears by the non-practice of them, the which wherever you see drayning and trenching you shall rarely find few or none of them wrought to the bottome. . . . Go to the bottome of the bog, and there make a trench in the sound ground, or else in some old ditch, so low as thou verily conceivest thy selfe assuredly under the level of the spring or spewing water, and then carry up thy trench into thy bogg straight through the middle of it, one foot under that spring; . . . but for these common and many trenches, oft times crooked too, that men usually make in their boggy grounds, some one foot, some two, never having respect to the cause or matter that maketh the bogg to take that way, I say away

Agricultural Drainage.

with them as a great piece of folly, lost labour, and spoyle. . . . After thou has brought a trench to the bottom of the bog, then cut a good substantial trench about thy bog; and when thou hast so done make one work or two just overthwart it, *upwards and downwards*, all under the matter of the bog. Then thou must take good green faggots, willow, alder, elme, or thorne, and lay in the bottome of thy works, and then take thy turfe thou tookest up in the top of thy trench, and plant upon them with the green sward downwards; *or take great pebbles, stones, or flint stones, and so fill up the bottome of thy trench about fifteen inches high*, and take thy turfe and plant it as aforesaid, being cut very fit for the trench, as it may join close as it is layd downe, and then having covered it all over with earth, and made it even as thy other ground, waite and expect a wonderfull effect through the blessing of God."

These sagacious arguments and instructions were doubtless acted upon by some persons in his own times and since; but still they had never attained to general adoption, and were ultimately forgotten. Towards the close of last century, Mr Elkington, a Warwickshire farmer, discovered and promulgated a plan of laying dry sloping land that is drowned by the outbursting of springs. When the higher lying portion of such land is porous, rain falling upon it sinks down until it is arrested by clay or other impervious matter, which causes it again to issue at the surface and wet the lower-lying ground. Elkington showed that by cutting a deep drain through the clay, aided when necessary by wells or augur holes, the subjacent bed of sand or gravel in which a body of water is pent up by the clay, as in a vessel, might be tapped, and the water conveyed harmlessly in the covered drain to the nearest ditch or stream. In the circumstances to which it is applicable, and in the hands of skilful drainers, Elkington's plan, by bringing into play the natural drainage furnished by porous strata, is often eminently successful. His system was given to the public in a quarto volume, edited by a Mr John Johnston of Edinburgh, who does not seem to have shared the engineering talents of the man whose discoveries he professes to expound. During the thirty or forty years subsequent to the publication of this volume, most of the draining that took place was on this system, and an immense capital was expended in such works with very varying results. Things continued in this position until about the year 1823, when the late James Smith of Deanston having discovered anew those principles of draining so long before indicated by Blithe, proceeded to exemplify them in his own practice, and to expound them to the public in a way that speedily effected a complete revolution in the art of draining, and marked an era in our agricultural progress. Instead of persisting in fruitless attempts to dry extensive areas by a few dexterous cuts, he insisted on the necessity of providing every field that needed draining at all with a complete system of parallel underground channels, running in the line of the greatest slope of the ground, and so near to each other that the whole rain falling at any time upon the surface should sink down and be carried off by the drains. The distances between drains he showed must be regulated by the greater or less retentiveness of the ground operated upon, and gave 10 feet as the minimum, and 40 feet as the maximum of these distances. The depth which he prescribed for his parallel drains was 30 inches, and these were to be filled with 12 inches of stones small enough to pass through a 3-inch ring—in short, a new edition of Blithe's drain. A main receiving-drain was to be carried along the lowest part of the ground with sub-mains in every subordinate hollow that the ground presented. These receiving-drains were directed to be formed with a culvert of stone work, or of tiles, of waterway sufficient to contain the greatest volume of water at any time requiring to be passed from the area to which they respectively supplied the outlet. The whole cultivated lands of Britain being disposed in ridges which usually lie in the line of greatest ascent, it became customary to form the drains in each furrow, or in each alternate, or third, or fourth one, as the case might require, or views of economy dictate, and hence the system soon came to be popularly called *furrow draining*. From the number and arrangement of the drains, the terms *frequent* and *parallel* were also applied to it. Mr Smith himself more appropriately named it, from its effects, *thorough draining*. The sound principles thus promulgated by him were speedily adopted and extensively carried into practice. The great labour and cost incurred in procuring stones in adequate quantities, and the difficulty of carting them in wet seasons, soon led to the substitution of tiles and soles of burned earthenware. The limited supply and high price of these tiles for a time impeded the progress of the new system of draining; but the opportune invention by the Marquis of Tweeddale of a tile-making machine, followed as this was by a rapid succession of more perfect machines for the same purpose, at once removed this impediment, and gave a mighty stimulus to this fundamental agricultural improvement. The substitution of cylindrical pipes for the original horse-shoe tiles has still further aided the progress of land-drainage, both by lowering the cost and increasing the efficiency and permanency of such works.

Elkington's system.

Smith of Deanston's system.

The system introduced and so ably expounded by Smith of Deanston has now virtually been adopted by all drainers. Variations in matters of detail (having respect chiefly to the depth and distance apart of the parallel drains) have indeed been introduced; but the distinctive features of his system (viz., provision for laying dry the entire area of land operated upon to the minimum depth required for the healthy growth of cultivated crops, by a series of parallel drains running in the line of the greatest slope of the ground) are now recognised and acted upon by all scientific drainers.

Direction of drains.

In setting about the draining of a field, or farm, or estate, the first point is to secure, at whatever cost, a proper outfall. The lines of the receiving drains must next be determined, and then the direction of the parallel drains. The former must occupy the lowest part of the natural hollows, and the latter must run in the line of the greatest ascent of the ground. In the case of flat land, where a fall is obtained chiefly by increasing the depth of the drains at their lower ends, these lines may be disposed in any direction that is found convenient; but in undulating ground a single field may require several distinct sets of drains lying at different angles, so as to suit its several slopes. When a field is ridged in the line of the greatest ascent of the ground, there is an obvious convenience in adopting the furrows as the site of the drains; *but wherever this is not the case the drains must be laid off to suit the contour of the ground, irrespective of the furrows altogether.* When parts of a field are flat and other parts have a considerable acclivity, it is expedient to cut a receiving drain near to the bottom of the slopes, and to give the flat ground an independent set of drains. In laying off receiving drains it is essential to give hedge-rows and trees a good offing, lest the conduit should be obstructed by roots. When a main drain is so placed that parallel ones empty into it from both sides, care should be taken that the inlets of the latter are not made exactly opposite to each other. Indeed, we have found it expedient in such cases to have two receiving drains parallel to each other, each to receive the subordinate drains from its own side only. As these receiving drains act also as ordinary drains to the land through which they pass, no additional cost is incurred by having two instead of one, provided they are as far apart as the other drains in the field. Much of the success of draining depends on the skilful planning of these main drains, and in making them large enough to discharge the greatest flow of water to which they may be exposed. Very long main drains are to be avoided. Nu-

merous outlets are also objectionable, from their liability to obstruction. An outlet to an area of from ten to fifteen acres is a good arrangement. These outlets should be faced with mason-work, and guarded by iron gratings.

Depth of drains.

The depths of the parallel drains must next be determined. In order to obtain proper data for doing so, the subsoil must be carefully examined by digging test-holes in various places, and also by taking advantage of any quarries, deep ditches, or other cuttings in the proximity, that afford a good section of the ground. We have already expressed an opinion that the drains should not be less than four feet deep; but it is quite possible that the discovery at a greater depth than four feet of a seam of gravel, or other very porous material charged with water, underlying considerable portions of the ground, may render it expedient to carry the drains so deep as to reach this seam. Such a seam, when furnished with sufficient outlets, supplies a natural drain to the whole area under which it extends. When such exceptional cases are met with, they are precisely those in which deep drains, at wide intervals, can be trusted to dry the whole area. When the subsoil consists of a tenacious clay of considerable depth, it is considered by many persons that a greater depth than three feet is unnecessary. The greater depth is, however, always to be preferred; for a drain of four feet, if it works at all, not only does all that a shallower one can do, but frees from stagnant water a body of subsoil on which the other has no effect at all. It has indeed been alleged that such deep drains may get so closed over by the clay that water will stand above them. If the surface of clay soil is wrought into puddle by improper usage, water can undoubtedly be made to stand for a time over the shallowest drains as easily as over the deepest. But the contraction which takes place in summer in good alluvial clays gradually establishes fissures, by which water reaches the drains. In such soils it is usually a few years before the full effect of draining is attained. This is chiefly due to the contraction and consequent cracking of clay soils in summer just referred to, and partly, as Mr Parkes thinks, to the mining operations of the common earth-worm. Both of these natural aids to drainage operate with greater force with drains 4 feet deep than when they are shallower. The tardy percolation of water through clay soils seems also a reason why in such cases it should get the benefit of a greater fall, by making the drain deep. Draining is always a costly operation, and it is therefore peculiarly needful to have it executed in such a way that it shall be effectual and permanent. We advocate a minimum depth of 4 feet, because of our strong conviction that such drains carefully made will be found to have both these qualities. And this opinion is the result of dear-bought experience, for we have found it necessary in our own case to re-open a very considerable extent of 30-inch drains in consequence of their having totally failed to lay the land dry, and to replace them by 4-feet ones, which have proved perfectly efficacious. In doing this we have seen a 30-inch drain opened up and found to be perfectly dry, and yet when the same trench was deepened to 4 feet there was quite a run of water from it. We earnestly dissuade all parties who are about to undertake drainage works from giving ear to representations about the sufficiency and economy of shallow drains. These, doubtless, cost somewhat less to begin with, but in thousands of cases they fail to accomplish the desired end, and the unfortunate owners, after all their outlay, are left to the miserable alternative of seeing their land imperfectly drained, or of executing the works anew, and thus losing the whole cost of the first and inefficient ones. The extreme reluctance with which the latter alternative is necessarily regarded will undoubtedly operate for a long time in keeping much land that has been hastily and imperfectly drained from participating in the benefits of *thorough* drainage.

Distance betwixt drains.

The distance apart at which the drains should be cut must be determined by the nature of the subsoil. In the most retentive clays it need not be less than 18 feet. On the other hand, this distance cannot safely be exceeded in the case of any subsoil in which clay predominates, although it should not be of the most retentive kind. In all parts of the country instances abound in which drains cut in such subsoils, from 24 to 30 feet apart, have totally failed to lay the land dry. When ground is once pre-occupied by drains too far apart, there is no remedy but to form a supplementary one betwixt each pair of the first set; and thus, by exceeding the proper width at first, the space betwixt the drains is unavoidably reduced to 12 or 15 feet, although 18 feet would originally have sufficed. It is only with a decided porosity in the subsoil, and in proportion to the degree of that porosity, that the space betwixt drains can safely be increased to 24, or 30, or 36 feet. In those exceptional cases in which drains more than 36 feet apart prove effectual, their success is due to the principle on which Elkington's system is founded. A few years ago an opinion obtained currency, that as the depth of drains was increased their width apart might with safety be increased in a corresponding ratio. And hence it came to be confidently asserted, that with a depth of 5 or 6 feet a width of from 40 to 60 feet might be adopted with a certainty of success, even in the case of retentive soils. We believe that experience has already demonstrated the unsoundness of this opinion. At all events, in recommending a minimum depth of 4 feet, we do so on the ground that (other things being equal) the whole benefits of drainage are more fully and certainly secured by drains of this depth than by those of $2\frac{1}{2}$ or 3 feet. In ordinary cases an increase of depth does not compensate for an increase of the width apart of the drains.

Pipes and collars of earthenware.

Cylindrical pipes with collars are undoubtedly the best draining material that has yet been discovered. The collars referred to are simply short pieces of pipe, just so wide in the bore as to admit of the smaller pipes which form the drain passing freely through them. In use, one of these collars is so placed as to encase the ends of each contiguous pair of tubes, and thus forms a loose fillet around each joining. The ends of these pipes being by this means securely kept in contact, a continuous canal for the free passage of water is infallibly insured; the joinings are guarded against the entrance of mud or vermin, and yet sufficient space is left for the admission of water. Pipes of all diameters, from 1 inch to 16 inches, are now to be had; those from 1 to 2 inches in the bore are used for subordinate drains; the larger sizes for sub-main and main receiving drains. Collars are used with the smaller sizes only, large pipes not being so liable to shift their position as small ones. In constructing a drain it is of much importance that the bottom be cut out just wide enough to admit the pipes and no more. Pipes, when thus accurately fitted in, are much less liable to derangement than when laid in the bottom of a trench several times their width, and into which a mass of loose earth must necessarily be returned. This accurate fitting is now quite practicable in the case of soils tolerably free from stones from the excellence of the draining tools that have lately been introduced. The following cut represents the most important of these tools.

Draining tools.

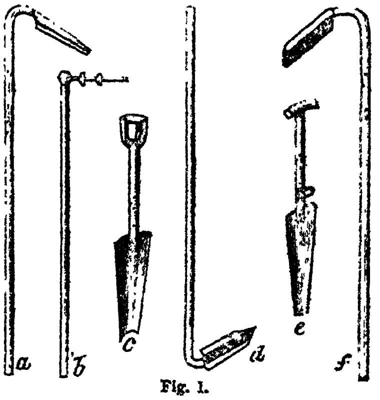

Fig. 1.

Agricultural Drainage.

a, *d*, and *f* recurved scoops for clearing out the debris, and *b* a pipe-layer, by means of which a workman standing at the margin of a drain hooks up a pipe and collar, and deposits them easily and accurately in the deep narrow trench.

How to deal with a quicksand.

If a quicksand is encountered in constructing a drain, it will be found expedient to put a layer of straw in the bottom of the trench, and then, instead of the ordinary pipe and collar, to use at such a place a double set of pipes—one within the other—taking care that the joinings of the inner set are covered by the centres of the outer ones. By such precautions the water gets vent, and the running sand is excluded from the drain. When a brook has been diverted from its natural course for mill-power or irrigating purposes, it often happens that portions of land are thereby deprived of the outfall required to admit of their being drained to a proper depth. In such cases it is frequently practicable to obtain the needed outlet by carrying a main drain through below the water-course, by using at that point a few yards of cast-iron pipe, and carefully filling up the trench with clay puddle, so that there may be no leakage from the water-course into the drain. While this is adoing the water must either be turned off or carried over the temporary gap in a wooden trough.

Cost of draining.

The cost of draining is so much influenced by the ever-varying price of labour and materials, and by the still more varying character of the land to be operated upon, that it is impossible to give an estimate of the cost that will admit of general application. The following tabular data, taken chiefly from Mr Bailey Denton's valuable treatise, are presented to aid those who wish to form such an estimate:—

TABLE I.—*Showing the number of rods of Drain per acre at given distances apart, and the number of Pipes of given lengths required per acre.*

Intervals between the Drains in feet.	Rods per acre.	Twelve-inch Pipes.	Thirteen-inch Pipes.	Fourteen-inch Pipes.	Fifteen-inch Pipes.
18	$146\frac{2}{3}$	2420	2234	2074	1936
21	$125\frac{5}{7}$	2074	1915	1778	1659
24	110	1815	1676	1555	1452
27	$97\frac{7}{9}$	1613	1489	1383	1290
30	88	1452	1340	1244	1161

TABLE II.—*Showing the Cost of Draining per acre at different intervals between the Drains.*

Various attempts have from time to time been made to lower the cost of draining land by the direct application of animal or steam power to the work of excavation. The most successful of these attempts is the steam-draining apparatus invented by Mr John Fowler of Bristol, usually called *Fowler's draining plough.* A six-horse portable

Fowler's steam draining apparatus.

steam-engine is anchored in one corner of the field to be drained. It gives motion to two drums, to each of which a rope, 500 yards long, is attached, the one uncoiling as the other is wound up. These ropes pass round blocks which are anchored at each end of the intended line of drain, and are attached one to the front and the other to the hind end of the draining apparatus. This consists of a framework, in which is fixed, at any required depth not exceeding $3\frac{1}{2}$ feet, a strong coulter terminating in a short horizontal bar of cylindrical iron, with a piece of rope attached to it, on which a convenient number of drain pipes are strung. This frame being pulled along by the engine, the coulter is forced through the soil at a regulated depth, and deposits its string of pipes with unerring accuracy, thus forming, as it proceeds, a perfect drain. The supply of pipes is kept up by means of holes previously dug in the line of the drain, at distances corresponding to the length of the rope on which they are strung. This machine was subjected to a very thorough trial at the meeting of the Royal Agricultural Society of England, at Lincoln, in 1854, on which occasion a silver medal and very high commendation were awarded to it. In March 1855 it was publicly stated that five of these implements are now at work in different parts of England, and that already 10,000 acres of land have been drained by means of them. At the Lincoln trial it was satisfactorily proved that this implement could work at a depth of $3\frac{1}{2}$ feet. As it moved along, the soil on either side, to the width of 2 or 3 feet, seemed to be loosened. It is therefore probable that this implement, or at least one propelled on the same principle, may yet be used as a subsoil disintegrator.

Land draining companies.

A great stimulus has recently been given to the improvement of land by the passing of a series of acts of parliament, which have removed certain obstacles which effectually hindered the investment of capital in works of drainage and kindred ameliorations. By the first of these acts, passed in 1846, a sum of L.4,000,000 of the public money was authorized to be advanced to landowners to be expended in draining their lands. The Inclosure Commissioners were charged with the allocation of this money, and the superintendence

of its outlay. The most important provisions of this act are, that it enables the possessors of entailed estates (equally with others) to share in the benefits of this fund—that it provides, on terms very favourable to the borrower, for the repayment of the money so advanced by twenty-two annual instalments—that before sanctioning the expenditure of these funds on drainage works, the commissioners must have a report from a qualified inspector, to the effect that they are likely to prove remunerative—and finally, that the works must be performed according to specifications prepared by the inspector, and approved by the commissioners, who have seldom allowed of a less depth of drain than $3\frac{1}{2}$ feet. By the end of the year 1854 the whole of this money was allocated, and more than half of it actually expended. Scottish landowners were so prompt to discern, and so eager to avail themselves of this public fund, that more than half of it fell to their share. The great success of this measure, and the rapid absorption of the fund provided by it soon led to further legislative acts, by which *private capital* has been rendered available for the improvement of land, by draining and otherwise, on conditions similar to those just enumerated. These acts are—

1st, The *Private Money's Drainage Act* (12th and 13th Vict., cap. 100), limited to draining only.

2d, The *West of England, or South-West Land Draining Company's Act* (11th and 12th Vict., cap. 142), for the purpose of draining, irrigation and warping, embanking, reclaiming and inclosing, and road-making.

3d, The *General Land-Drainage and Improvement Company's Act* (12th and 13th Vict., cap. 91), for the purposes of draining, irrigating and warping, embanking, reclaiming and inclosing, road-making, and erecting farm-buildings.

4th, The *Lands Improvement Company's Act* (16th and 17th Vict., cap. 154), for the same purposes as the above, with the addition of planting for shelter. This company's powers extend to Scotland.

By these acts ample provision is made for rendering the dormant capital of the country available for the improvement of its soil. To the owners of entailed estates they are peculiarly valuable, from the power which they give to them of charging the cost of draining, &c., upon the inheritance. If such owners apply their own private funds in effecting such improvements, they are enabled, through the medium of these companies, to take a rent-charge on their estates for the repayment of money which they so expend, over which they retain personal control, so that they can bequeath as they choose the rent-charge payable by their successor. Besides their direct benefits, these drainage acts have already produced some very important indirect fruits. They have led to many improvements in the manner of accomplishing the works to which they relate, to the wide and rapid dissemination of such improved modes of draining, &c., and, in particular, they have had the effect of creating, or at least of greatly multiplying and accrediting, a staff of skilful and experienced draining engineers, of whose services all who are about to engage in draining and similar works will do well to avail themselves. (J. W—N.)

DRAKE, Sir Francis, a celebrated English admiral, was born near Tavistock, Devonshire, in 1545. His father who had been bred a sailor, obtained a naval chaplaincy from Queen Elizabeth, and was afterwards vicar of Upnor church, on the Medway. Young Drake was educated at the expense and under the care of Sir John Hawkins, who was his kinsman; and, at the age of eighteen, he had risen to be purser of a ship trading to Biscay. At twenty he made a voyage to Guinea; and at twenty-two he was made captain of the *Judith.* In that capacity he was in the harbour of San Juan de Ulloa, in the Gulf of Mexico, where he behaved most gallantly in the actions under Sir John Hawkins, and returned with him to England, having acquired great reputation, though with the loss of all the money which he had embarked in the expedition. Having next projected an attack against the Spaniards in the West Indies to indemnify himself for his former losses, he set sail in 1572, with two small ships named the Pasha and the Swan. He was afterwards joined by another vessel; and with this small squadron he took and plundered the Spanish town of Nombre de Dios. With his men he penetrated across the isthmus of Panama, and committed great havoc among the Spanish shipping. In these expeditions he was much assisted by a nation of Indians, who were then engaged in a desultory warfare with the Spaniards. Having embarked his men and filled his ships with plunder, he bore away for England, where he arrived in August 1573.

His success and honourable demeanour in this expedition gained him high reputation; and the use which he made of his riches served to raise him still higher in popular esteem. Having fitted out three frigates at his own expense, he sailed with them to Ireland; and there, as a volunteer, under Walter earl of Essex, the father of the famous but unfortunate earl, performed many glorious actions. After the death of his patron he returned to England, where Sir Christopher Hatton introduced him to Queen Elizabeth, and procured him a favourable reception at court. In this way he acquired the means of undertaking that grand expedition which has immortalized his name. The first proposal he made was to undertake a voyage into the South Seas through the Straits of Magelhaens; an achievement which no Englishman had hitherto ever attempted. This project having been well received at court, the queen furnished him with means: and his own fame quickly drew together a sufficient force. The fleet with which he sailed on this enterprise consisted only of five small vessels, and their united crews mustered only 166 men. Having sailed on the 13th Dec. 1577, he on the 25th fell in with the coast of Barbary, and on the 29th with Cape Verde. On the 18th March he passed the equinoctial, made the coast of Brazil on the 5th of April, and entered the river Plata, where he parted company with two of his ships; but having met them again, and taken out their provisions, he turned them adrift. On the 29th May he entered the port of St Julian's, where he continued two months for the sake of laying in a stock of provisions. On the 20th Aug. he entered the Straits of Magelhaens, and on the 25th Sept. passed them, having then only his own ship. On the 25th Nov. he arrived at Macao, which he had appointed as the place of rendezvous in the event of his ships being separated; but Captain Winter, his vice-admiral, had repassed the straits and returned to England. He thence continued his voyage along the coast of Chili and Peru, taking all opportunities of seizing Spanish ships, and attacking them on shore, till his men were satiated with plunder; and then coasted along the shores of America, as far N. as Lat. 48., in an unsuccessful endeavour to discover a passage into the Atlantic. Having landed, however, he named the country *New Albion,* and took possession of it in the name of Queen Elizabeth. Having careened his ship, he set sail from thence on the 29th Sept. 1579 for the Moluccas. On the 13th Oct. he fell in with certain islands inhabited by the most barbarous people he had met with in all his voyage. On the 4th Nov. he got sight of the Moluccas; and, arriving at Ternate, was extremely well received by the king of that place, who appears from the most authentic relations of this voyage to have been a wise and politic prince. On the 10th Dec. he made the Celebes, where his ship unfortunately struck upon a

Drama.

rock, but was taken off without much damage. On the 16th March he arrived at Java, whence he intended to have directed his course to Malacca; but he found himself obliged to alter his purpose, and to think of returning home. On the 25th March 1580 he put this design in execution; and on the 15th June he doubled the Cape of Good Hope, having then on board only fifty-seven men and three casks of water. On the 12th July he passed the line, reached the coast of Guinea on the 16th, and there watered. On the 11th Sept. he made the island of Terceira, and on the 3d Nov. he entered the harbour of Plymouth. This voyage round the world was thus performed in two years and about ten months. Shortly after his arrival, the queen paid a visit to Deptford, went on board his ship, and there, after dinner, conferred upon him the honour of knighthood; at the same time declaring her entire approbation of all that he had done. She likewise gave directions for the preservation of his ship, that it might remain a monument of his own and his country's glory. In 1585 he sailed with a fleet to the West Indies, and took the cities of St Jago, St Domingo, Carthagena, and St Augustine. In 1587 he went to Lisbon with a fleet of thirty sail; and having received intelligence of a great fleet being assembled in the bay of Cadiz, and destined to form part of the Armada, he with great courage entered the port and there burnt upwards of 10,000 tons of shipping; a feat which he afterwards jocosely called "singeing the king of Spain's beard." In 1588, when the Spanish Armada was approaching our shores, Sir Francis Drake was appointed vice-admiral under Lord Howard, and made prize of a very large galleon, commanded by Don Pedro de Valdez, who was reputed the projector of the invasion. This affair deserves to be particularly stated. On the 22d of July, Sir Francis, observing a great Spanish ship floating at a distance from both fleets, sent his pinnace to summon the commander to yield. Valdez replied, with much Spanish solemnity, that they were four hundred and fifty strong, that he himself was Don Pedro, and stood much upon his honour; and thereupon propounded several conditions upon which he was willing to yield. But the vice-admiral replied, that he had no leisure to parley; that if the Don thought fit instantly to yield, he might; if not, he should soon find that Drake was no coward. Pedro, hearing the name of Drake, immediately yielded, and with forty-six of his attendants came on board the admiral's ship.

It deserves to be noticed that Drake's name is mentioned in the singular diplomatic communication from the King of Spain which preceded the Armada:—

> Te veto ne pergas bello defendere Belgas;
> Quæ Dracus eripuit nunc restituantur oportet;
> Quas pater evertit jubeo te condere cellas:
> Religio Papæ fac restituatur ad unguem.

To these the queen made this extempore response:—

> Ad Græcas, bone rex, fiant mandata kalendas.

In 1589, Sir Francis Drake commanded the fleet sent to restore Dom Antonio, king of Portugal, the land forces being under the orders of Sir John Norris; but they had hardly put to sea when the commanders differed, and thus the attempt proved abortive. But as the war with Spain continued, a more formidable expedition was fitted out, under Sir John Hawkins and Sir Francis Drake, against their settlements in the West Indies, than had hitherto been undertaken during the whole course of it. Here, however, the commanders again disagreed about the plan; and the result in like manner disappointed public expectation. These disasters were keenly felt by Drake, and were the principal cause of his death, which took place on board his own ship, near the town of Nombre de Dios, in the West Indies, Jan. 28, 1595.

Drakenborch || Drama.

DRAKENBORCH, Arnold, a celebrated scholar and editor, was a native of Utrecht, where he was born January 1, 1684. Having studied belles-lettres under Grævius and Burmann, and law under Cornelius Van Eck, he succeeded Professor Burmann in 1716, and continued to hold his professorship till his death in 1748, in the sixty-fourth year of his age. His earliest work was a dissertation entitled *Disputatio philologico-historica de Præfecto urbis*, in 4to, and its intrinsic merit caused it to be reprinted at Frankfort, in 1752, by Professor Uhl, accompanied with a life of its learned author. His next work, entitled *Disputatio de officio præfectorum prætorio*, was published in 1707; and ten years afterwards he gave to the world his edition of Silius Italicus, in seventeen books, 4to. In order to render this edition as perfect as possible, nothing was omitted; and many historical subjects were engraved for the purpose of elucidating the text, to which his own copious and learned annotations greatly contributed. But his splendid edition of Livy, Lugd. Batav. 1738 and 1746, 7 tom., with a life of that eminent historian, is that on which his fame as a scholar chiefly rests. The preface to this work is replete with erudition, and gives a particular account of all the literary men who have at different periods commented on the works of Livy. His edition is based on that of Gronovius; but he made many important alterations on the authority of manuscripts which it is probable Gronovius had either never seen, or not taken the pains to consult. Upon the whole, this edition of Livy is one of the most elaborate, interesting and instructive, ever given to the world.

DRAMA.

A drama (we adopt Dr Johnson's definition, with some little extension) is a poem or fictitious composition in dialogue, in which the action is not related, but represented.

A disposition to this fascinating amusement, considered in its rudest state, seems to be inherent in human nature. It is the earliest sport of children to take upon themselves some fictitious character, and sustain it to the best of their skill, by such appropriate gesture and language as their youthful fancies suggest, and such dress and decoration as circumstances place within their reach. The infancy of nations is as prone to this pastime as that of individuals. When the horde emerges out of a nearly brutal state, so far as to have holidays, public sports, and general rejoicings, the pageant of their imaginary deities, or of their fabulous ancestors, is usually introduced as the most pleasing and interesting part of the show. But however general the predisposition to the assumption of fictitious character may be, there is an immeasurable distance betwixt the rude games in which it first displays itself, and that polished amusement which is numbered among the fine arts, which poetry, music, and painting have vied to adorn, and to whose service genius has devoted her most sublime efforts; whilst philosophy has stooped from her loftier task, to regulate the progress of the action, and give probability to the representation and personification of the scene.

Outline.

The history of Greece—of that wonderful country, whose days of glory have left such a never-dying blaze of radiance behind them—the history of Greece affords us the means of correctly tracing the polished and regulated drama, the subject of severe rule, and the vehicle for ex-

pressing the noblest poetry, from amusements as rude in their outline as the mimic sports of children or of savages. The history of the Grecian stage is that of the dramatic art in general. They transferred the drama, with their other literature, to the victorious Romans, with whom it rather existed as a foreign than flourished as a native art. Like the other fine arts, the stage sunk under the decay of the empire, and its fall was accelerated by the introduction of the Christian religion. In the middle ages dramatic representation revived, in the shape of the homely Mysteries and Moralities of our forefathers. The revival of letters threw light upon the scenic art, by making us acquainted with the pitch of perfection to which it had been carried by the genius of Greece. With this period commences the history of the modern stage, properly so called. Some general observations on the drama, and its present state in Britain, will form a natural conclusion to the article.

Rise of the Grecian drama.

The account which we have of the origin of Grecian theatrical representations, describes them as the fantastic orgies of shepherds and peasants, who solemnized the rites of Bacchus by the sacrifice of a goat, by tumultuous dances, and by a sort of masquerade, in which the actors were disguised like the ancient *Morrice-dancers* of England, or the *Guisards* of Scotland, who have not as yet totally disused similar revels. Instead of masks, their faces were stained with the lees of wine, and the songs and jests corresponded in coarseness to the character of the satyrs and fawns, which they were supposed to assume in honour of their patron Bacchus. Music, however, always formed a part of this rude festivity, and to this was sometimes added the recitations of an individual performer, who, possessed of more voice or talent than his companions, was able to entertain an audience for a few minutes by his own individual exertions.

Out of such rude materials, Thespis is supposed to have been the first who framed something like an approach to a more regular entertainment. The actors under this, the first of theatrical managers, instead of running about wild among the audience, were exalted upon a cart, or upon a scaffold formed of boards laid upon tressels. In these improvements Thespis is supposed to have had the aid of one Susarion, whose efforts were more particularly directed to the comic drama. But their fortunes have been unequal, for whilst the name of Thespis is still united with every thing dramatic, that of Susarion has fallen into oblivion, and is only known to antiquaries.

The drama in Greece, as afterwards in Britain, had scarcely begun to develope itself from barbarism, ere, with the most rapid strides, it advanced towards perfection. Thespis and Susarion flourished about four hundred and forty or fifty years before the Christian era. The battle of Marathon was fought in the year 490 before Christ; and it was upon Æschylus, one of the Athenian generals on that memorable occasion, that Greece conferred the honoured title of the Father of Tragedy. We must necessarily judge of his efforts by that which he did, not by that which he left undone; and if some of his regulations may sound strange in modern ears, it is but just to compare the state in which he found the drama, with that in which he left it.

Æschylus was the first, who, availing himself of the invention of a stage by Thespis, introduced upon the boards a plurality of actors at the same time, and converted into action and dialogue, accompanied or relieved at intervals by the musical performance of the chorus, the dull monologue of the Thespian orator. It was Æschylus, also, who introduced the deceptions of scenery, stationary indeed, and therefore very different from the decorations of our stage, but still giving a reality to the whole performance, which could not fail to afford pleasure to those who beheld for the first time an effort to surround the player, while invested with his theatrical character, with scenery which might add to the illusions of the representations. But this was not all. A theatre, at first of wood, but afterwards of stone, circumscribed, whilst it accommodated, the spectators, and reduced a casual and disorderly mob to the quality and civilization of a regular and attentive audience.

The most remarkable effect of the tragedy of Æschylus was the introduction of the chorus in a new character, which continued long to give a peculiar tone to the Grecian drama, and to make a striking difference betwixt that original theatre and those which have since arisen in modern nations.

The chorus who sung hymns in favour of Bacchus, the musical part, in short, of the entertainment, remained in the days of Thespis, as it had been in the rude village gambols which he had improved, the principal part of the dramatic entertainment. The intervention of monologue, or recitation, was merely a relief to the musicians and a variety to the audience. Æschylus, whilst he assigned a part of superior consequence to the actor in his improved dialogue, new-modelled the chorus, which custom still enjoined as a necessary and indispensable branch of the performance. They were no longer a body of vocal musicians, whose strains were as independent of what was spoken by the personages of the drama, as those of our modern orchestra when performing betwixt the acts. The chorus assumed from this time a different and complicated character, which forms a marked peculiarity in the Grecian drama, distinguishing it from the theatrical compositions of modern Europe.

The chorus, according to this new model, was composed of a certain set of persons, priests, captive virgins, matrons, or others, usually of a solemn and sacred character, the contemporaries of the heroes who appeared on the stage, who remained upon the scene to celebrate in hymns set to music the events which had befallen the active persons of the drama; to afford them alternately their advice or their sympathy; and, at least, to moralize, in lyrical poetry, on the feelings to which their history and adventures, their passions and sufferings, gave rise. The chorus might be considered as, in some degree, the representatives of the audience, or rather of the public, on whose great stage those events happen in reality which are presented in the mimicry of the drama. In the strains of the chorus, the actual audience had those feelings suggested to them as if by reflection in a mirror, which the events of the scene ought to produce in their own bosom; they had at once before them the action of the piece, and the effect of that action upon a chosen band of persons, who, like themselves, were passive spectators, whose dignified strains pointed out the moral reflections to which the subject naturally gave rise. The chorus were led or directed by a single person of their number, termed the coryphæus, who frequently spoke or sung alone. They were occasionally divided into two bands, who addressed and replied to each other. But they always preserved the character proper to them, of spectators, rather than agents in the drama.

The number of the chorus varied at different periods, often extending to fifty persons, and sometimes restricted to *half* that number; but it is evident that the presence of so many persons on the scene, officiating as no part of the *dramatis personæ*, but rather as contemporary spectators, involved many inconveniences and inconsistencies. That which the hero, however agitated by passion, must naturally have suppressed within his own breast, or uttered in soliloquy, was thus necessarily committed to the

confidence of fifty people, less or more. And when a deed of violence was to be committed, the helpless chorus, instead of interfering to prevent the atrocity to which the perpetrator had made them privy, could only, by the rules of the theatre, exhaust their sorrow and surprise in dithyrambics. But still the union which Æschylus accomplished betwixt the didactic hymns of the chorus and the events which were passing upon the stage, was a most important improvement upon the earlier drama. By this means the two unconnected branches of the old Bacchanalian revels were combined together; and we ought rather to be surprised that Æschylus ventured, whilst accomplishing such an union, to render the hymns sung by the chorus subordinate to the action or dialogue, than that he did not take the bolder measure of altogether discarding that which, before his time, was reckoned the principal object of a religious entertainment.

Grecian theatre, and mode of acting.

The new theatre and stage of Athens were reared, as we have seen, under the inspection of Æschylus. He also introduced dresses in character for his principal actors, to which were added embellishments of a kind which mark the wide distinction betwixt the ancient and modern stage. The personal disguise which had formerly been attained by staining the actor's face, was now, by what doubtless was considered as a high exertion of ingenuity, accomplished by the use of a mask, so painted as to represent the personage whom he performed. To augment the apparent awkwardness of this contrivance, the mouths of these masks were frequently fashioned like the extremity of a trumpet, which, if it aided the actor's voice to reach the extremity of the huge circuit to which he addressed himself, must still have made a ridiculous appearance upon the stage, had not the habits and expectations of the spectators been in a different tone from those of a modern audience. The use of the *cothurnus* or buskin, which was contrived so as to give to the performer additional and unnatural stature, would have fallen under the same censure. But the ancient and modern theatres may be said to resemble each other only in name, as will appear from the following account of the Grecian stage, abridged from the best antiquaries.

The theatres of the Greeks were immensely large in comparison to ours; and the audience sat upon rows of benches, rising above each other in due gradation. In form they resembled a horse-shoe. The stage occupied a platform, which closed in the flat end of the building, and was raised so high as to be on a level with the lowest row of benches. The central part of the theatre, or what we call the pit, instead of being filled with spectators, according to modern custom, was left for the occasional occupation of the chorus, during those parts of their duty which did not require them to be nearer to the stage. This space was called the *orchestra,* and corresponded in some measure with the open space which, in the modern equestrian amphitheatres, is interposed betwixt the audience and the stage, for the display of feats of horsemanship. The delusion of the scene being thus removed to a considerable distance from the eye of the spectator, was heightened; and many of the objections offered to the use of the mask and the buskin were lessened or totally removed. When the chorus did not occupy the orchestra, they ranged themselves beside the *thymele,* a sort of altar, surrounded with steps, placed in front of their stage orchestra. From this, as a post of observation, they watched the progress of the drama, and to this point the actors turned themselves when addressing them. The solemn hymns and mystic dances of the chorus, performed during their retreat into the orchestra, formed a sort of interludes, or interruptions of the action, similar in effect to the modern division into acts. But, properly speaking, there was no interruption of the representation from beginning to end. The piece was not, indeed, constantly progressive; but the illusion of the scene was always before the audience, either by means of the actors themselves or of the chorus. And the musical recitation and character of the dances traced by the chorus in their interludes, were always in correspondence with the character of the piece, grave, majestic, and melancholy; in tragedy, gay and lively; in comedy, and during the representation of satirical pieces, wild, extravagant, and bordering on buffoonery. The number of these interludes, or interruptions of the action, seems to have varied from three to six, or even more, at the pleasure of the author. The music was simple and inartificial, although it seems to have produced powerful effects on the audience. Two flute-players performed a prelude to the choral hymns, or directed the movement of the dances, which in tragedy were a solemn, slow, modulated succession of movements, very little resembling anything termed dancing among the moderns.

The stage itself was well contrived for the purposes of the Greek drama. The front was called the *logeum,* and occupied the full width of the flat termination of the theatre, contracted, however, at each extremity by a wall, which served to conceal the machinery necessary for the piece. The stage narrowed as it retired backwards; and the space so restricted in breadth was called the *proscenium.* It was terminated by a flat decoration, on which was represented the front of a temple, palace, or whatever else the poet had chosen for his scene. Suitable decorations appeared on the wings, as in our theatres. There were several entrances, both by the back scene and in front. These were not used indiscriminately, but so as to indicate the story of the piece, and render it more clear to apprehension. Thus, the persons of the drama who were supposed to belong to the palace or temple in the flat scene, entered from the side or the main door, as befitted their supposed rank; those who were inhabitants of the place represented, entered through a door placed at the side of the logeum; while those supposed to come from a distance were seen to traverse the orchestra, and to ascend the stage by a stair of communication, so that the audience were made spectators, as it were, of their journey. The proscenium was screened by a curtain, which was withdrawn when the piece commenced. The decorations could be in some degree altered, so as to change the scene; though this, we apprehend, was seldom practised. But machinery for the ascent of phantoms, the descent of deities, and similar exhibitions, were as much in fashion among the Greeks as on our own modern stage; with better reason, indeed, for we shall presently see that the themes which they held most proper to the stage called frequently for the assistance of these mechanical contrivances.

In the dress and costume of their personages the Greeks bestowed much trouble and expense. It was their object to disguise as much as possible the mortal actor who was to represent a divinity or an hero; and while they hid his face and augmented his height, they failed not to assign him a mask and dress in exact conformity to the popular idea of the character represented; so that, seen across the orchestra, he might appear the exact resemblance of Hercules or of Agamemnon.

The Grecians, but in particular the Athenians, became most passionately attached to the fascinating and splendid amusement which Æschylus thus regulated, which Sophocles and Euripides improved, and which all three, with other dramatists of inferior talents, animated by the full vigour of their genius. The delightful climate of Greece permitted the spectators to remain in the open air (for

there was no roof to their huge theatres) for whole days, during which several plays, high monuments of poetical talent, were successively performed before them. The enthusiasm of their attention may be judged of by what happened during the representation of a piece written by Hegemon. It was while the Athenians were thus engaged that there suddenly arrived the astounding intelligence of the total defeat of their army before Syracuse. The theatre was filled with the relations of those who had fallen; there was scarcely a spectator, who, besides sorrowing as a patriot, was not called to mourn a friend or relative. But, spreading their mantles before their faces, they commanded the representation to proceed; and thus veiled, continued to give it their attention to the conclusion. National pride, doubtless, had its share in this singular conduct, as well as fondness for the dramatic art. Another instance is given of the nature and acuteness of their feelings, when the assembly of the people amerced Phrynicus in a fine of a thousand drachmæ, because, in a comedy founded upon the siege of Miletos, he had agitated their feelings to excess, in painting an incident which Athens lamented as a misfortune dishonourable to her arms and her councils.

The price of admission was at first one *drachma;* but Pericles, desirous of propitiating the ordinary class of citizens, caused the entrance-money to be lowered to two *oboli,* so that the meanest Athenian had the ready means of indulging in this luxurious mental banquet. As it became difficult to support the expense of the stage, for which such cheap terms of admission could form no adequate fund, the same statesman, by an indulgence yet more perilous, caused the deficiency to be supplied from the treasure destined to sustain the expense of the war. It is a sufficient proof of the devotion of the Athenians to the stage, that not even the eloquence of Demosthenes could tempt them to forego this pernicious system. He touched upon the evil in two of his orations; but the Athenians were resolved not to forego the benefits of an abuse which they were aware could not be justified, and they passed a law making it death to touch upon that article of reformation.

It must not be forgotten, that the Grecian audience enjoyed the exercise of critical authority, as well as of classical amusement, at their theatre. They applauded and censured, as at the present day, by clapping hands and hissing. Their suffrage at those tragedies acted upon the solemn feasts of Bacchus, adjudged a laurel crown to the most successful dramatic author. This faculty was frequently abused; but the public, on sober reflection, seldom failed to be ashamed of such acts of injustice, and faithful, upon the whole, to the rules of criticism, evinced a fineness and correctness of judgment, which never descended to the populace of any other nation.

Peculiar character of the Grecian drama.

To this general account of the Grecian stage, it is proper to add some remarks on those peculiar circumstances from which it derives a tone and character so different from that of the modern drama; circumstances affecting at once its style of action, mode of decoration, and general effect on the feelings of the spectators.

The Grecian drama, it must be remembered, derived its origin from a religious ceremony; and, amid all its refinement, never lost its devotional character, unless it shall be judged to have done so in the department of satirical comedy.

When the audience was assembled, they underwent a religious lustration, and the archons or chief magistrates paid their public adoration to Bacchus, still regarded as the patron of the theatrical art, and whose altar was always placed in the theatre.

The subject of the drama was frequently religious. In tragedy especially, Sophocles and Euripides, as well as Æschylus, selected their subjects from the exploits of the deities themselves, or of the demigods and heroes whom Greece accounted to draw an immediate descent from the denizens of Olympus, and to whom she paid nearly equal reverence. The object of the tragic poets was less to amuse and interest their audience by the history of the human heart, or soften them by the details of domestic distress, than to elevate them into a sense of devotion or submission, or to astound and terrify them by the history and actions of a race of beings before whom ordinary mortality dwindled into pigmy size. This they dared to attempt; and, what may appear still more astonishing to the mere English reader, this they appear in a great measure to have performed. Effects were produced upon their audience which we can only attribute to the awful impression communicated by the idea of the immediate presence of the divinity. The emotions excited by the apparition of the Eumenides or furies, in Æschylus's tragedy of that name, so appalled the audience that females are said to have lost the fruit of their womb, and children to have actually expired in convulsions of terror. These effects may have been exaggerated; but that considerable inconveniences occurred from the extreme horror with which this tragedy impressed the spectators, is evident from a decree of the magistrates, limiting the number of the chorus, in order to prevent in future such tragical consequences. It is plain that the feeling by which such impressions arose must have been something very different from what the spectacle of the scene alone could possibly have produced. The mere sight of actors disguised in masks, suited to express the terrific yet sublime features of an antique Medusa, with her hair entwined with serpents,—the wild and dishevelled appearance, the sable and bloody garments, the blazing torches, the whole apparatus, in short, or properties as they are technically called, with which the classic fancy of Æschylus could invest those terrific personages,—nay more, even the appropriate terrors of language and violence of gesture with which they were bodied forth, must still have fallen far short of the point which the poet certainly attained, had it not been for the intimate and solemn conviction of his audience that they were in the performance of an act of devotion, and to a certain degree in the presence of the deities themselves. It was this conviction, and the solemn and susceptible temper to which it exalted the minds of a large assembly, which prepared them to receive the electric shock produced by the visible representation of those terrible beings, to whom, whether as personifying the stings and terrors of an awakened conscience, or as mysterious and infernal divinities, the survivors of an elder race of deities, whose presence was supposed to strike awe even into Jove himself, the ancients ascribed the task of pursuing and punishing atrocious guilt.

It was in consistency with this connection betwixt the drama and religion of Greece, that the principal Grecian tragedians thought themselves entitled to produce upon the stage the most sacred events of their mythological history. It might have been thought that in doing so they injured the effect of their fable and action, since suspense and uncertainty, so essential to the interest of a play, could not be supposed to exist where the immortal gods, beings controlling all others, and themselves uncontrolled, were selected as the agents in the piece. But it must be remembered, that the synod of Olympus, from Jove downwards, were themselves but limitary deities, possessing indeed a certain influence upon human affairs, but unable to stem or divert the tide of fate or destiny, upon whose dark bosom, according to the Grecian creed, gods as well as men were embarked, and both sweeping downwards to

Drama. some distant yet inevitable termination of the present system of the universe, which should annihilate at once the race of divinity and of mortality. This awful catastrophe is hinted at not very obscurely by Prometheus, who, when chained to his rock, exults, in his prophetic view, in the destruction of his oppressor Jupiter; and so far did Æschylus, in particular, carry the introduction of religious topics into his drama, that he escaped with some difficulty from an accusation of having betrayed the Eleusinian mysteries.

Where the subject of the drama was not actually taken from mythological history, and when the gods themselves did not enter upon the scene, the Grecian stage was, as we have already hinted, usually trod by beings scarcely less awful to the imagination of the audience; the heroes namely of their old traditional history, to whom they attributed an immediate descent from their deities, a frame of body and mind surpassing humanity, and after death an exaltation into the rank of demigods.

It must be added, that, even when the action was laid among a less dignified set of personages, still the altar was present on the stage; incense frequently smoked; and frequent prayers and obtestations of the deity reminded the audience that the sports of the ancient theatre had their origin in religious observances. It is scarcely necessary to state how widely the classical drama, in this respect, differs in principle from that of the modern, which pretends to be nothing more than an elegant branch of the fine arts, whose end is attained when it supplies an evening's amusement, whose lessons are only of a moral description, and which is so far from possessing a religious character, that it has with difficulty escaped condemnation as a profane, dissolute, and antichristian pastime. From this difference of principle there flows a difference of practical results, serving to account for many circumstances which might otherwise seem embarrassing.

The ancients, we have seen, endeavoured by every means in their power, including the use of masks and of buskins, to disguise the person of the actor; and, at the expense of sacrificing the expression of his countenance, and the grace, or at least the ease, of his form, they removed from the observation of the audience every association which could betray the person of an individual player, under the garb of the deity or hero he was designed to represent. To have done otherwise would have been held indecorous, if not profane. It follows, that as the object of the Athenian and of the modern auditor in attending the theatre was perfectly different, the pleasure which each derived from the representation had a distinct source. Thus, for example, the Englishman's desire to see a particular character is intimately connected with the idea of the actor by whom it is performed. He does not wish to see Hamlet in the abstract, so much as to see how Kemble performs that character,[1] and to compare him perhaps with his own recollections of Garrick in the same part. He comes prepared to study each variation of the actor's countenance, each change in his accentuation and deportment; to note with critical accuracy the points which discriminate his mode of acting from that of others; and to compare the whole with his own abstract of the character. The pleasure arising from this species of critical investigation and contrast is so intimately allied with our ideas of theatrical amusement, that we can scarce admit the possibility of deriving much satisfaction from a representation sustained by an actor whose personal appearance and peculiar expression of features should be concealed from us, however splendid his declamation, or however appropriate his gesture and action. But this mode of considering the drama, and the delight which we derive from it, would have appeared to the Greeks a foolish and profane refinement, not very different in point of taste from the expedient of Snug the joiner, who intimated his identity by letting his natural visage be seen under the mask of the lion which he represented. It was with the direct purpose of concealing the features of the individual actor, as tending to destroy the effect of his theatrical disguise, that the mask and buskin were first invented, and afterwards retained in use. The figure was otherwise so dressed as to represent the deity or demigod, according to the statue best known, and adored with most devotion, by the Grecian public. The mask was, by artists who were eminent in the plastic art, so formed as to perfect the resemblance. Theseus or Hercules stood before the audience in the very form with which painters and statuaries had taught them to invest the hero, and there was certainly thus gained a more complete scenic deception than could have been obtained in our present mode. It was aided by the distance interposed betwixt the audience and the stage; but, above all, by the influence of enthusiasm acting upon the congregated thousands, whose imaginations, equally lively and susceptible, were prompt to receive the impressions which the noble verse of their authors conveyed to their ears, and the living personification of their gods and demigods placed before their eyes.

It is scarcely necessary to add, that, while these observations plead their apology for the mask and the buskin of the ancients, they leave, where it stood before, every objection to those awkward and unseemly disguises, considered in themselves, and without reference to the peculiar purpose and tendency of the ancient theatre. In fact, the exquisite pleasure derived from watching the eloquence of feature and eye, which we admire in an accomplished actor, was not, as some have supposed, sacrificed by the ancients for the assumption of these disguises. They never did, and, according to the plan of their theatres, never could, possess that source of enjoyment. The circuit of the theatre was immense, and the eyes of the thousands whom it contained were so far removed from the stage, that, far from being able to enjoy the minute play of the actor's features, the mask and buskin were necessary to give distinction to his figure, and to convey all which the ancients expected to see, his general resemblance, namely, to the character he represented.

The style of acting, so far as it has been described to us, corresponded to the other circumstances of the representation. It affected gravity and sublimity of movement and of declamation. Rapidity of motion and vivacity of action seem to have been reserved for occasions of particular emotion; and that delicacy of bye-play, as well as all the aid which look and slight jesture bring so happily to the aid of an impassioned dialogue, were foreign to their system. The actors, therefore, had an easier task than on the modern stage, since it is much more easy to preserve a tone of high and dignified declamation, than to follow out the whirlwind and tempest of passion, in which it is demanded of the performer to be energetic without bombast, and natural without vulgarity.

The Grecian actors held a high rank in the republic,

---

[1] It is proper to state here, once for all, that, contrary to our usual practice, this article is reprinted as it originally appeared in the Supplement to the fourth, fifth, and sixth editions of this work, without any of those adaptations which the course of time and change of circumstances render necessary in ordinary cases. We have deemed this homage due to the genius and fame of the illustrious author (Sir Walter Scott), whose splendid view of the origin and progress of the dramatic art we have accordingly presented to the reader exactly as it proceeded from his own hand, leaving every contemporaneous allusion and illustration untouched.

Drama.

and those esteemed in the profession were richly recompensed. Their art was the more dignified, because the poets themselves usually represented the principal character in their own pieces; a circumstance which corroborates what we have already stated concerning the comparative inferiority of talents required in a Grecian actor, who was only expected to move with grace and declaim with truth and justice. His disguise hid all personal imperfections; and thus a Grecian poet might aspire to become an actor without that extraordinary and unlikely union of moral and physical powers which would be necessary to qualify a modern dramatist to mount the stage in person, and excel at once as a poet and as an actor.

Principal tragic writers in Athens.

It is no part of our present object to enter into any minute examination of the comparative merits of the three great tragedians of Athens, Æschylus, Sophocles, and Euripides. Never, perhaps, did there arise, within so short a space, such a succession of brilliant talents. Sophocles might, indeed, be said to be the contemporary of both his rivals, for his youthful emulation was excited by the success of Æschylus, and the eminence of his latter years was disturbed by the rivalry of Euripides, whom, however, he survived. To Æschylus, who led the van in the dramatic enterprise, as he did in the field of Marathon, the sanction of antiquity has ascribed unrivalled powers over the realms of astonishment and terror. At his summons, the mysterious and tremendous volume of destiny, in which are inscribed the doom of gods and men, seemed to display its leaves of iron before the appalled spectators; the more than mortal voices of Deities, Titans, and departed Heroes, were heard in awful conference; heaven bowed, and its divinities descended; earth yawned, and gave up the pale spectres of the dead, and the yet more undefined and grisly forms of those infernal deities who struck horror into the gods themselves. All this could only be dared and done by a poet of the highest order, confident, during that early age of enthusiasm, that he addressed an audience prompt to kindle at the heroic scene which he placed before them. It followed almost naturally, from his character, that the dramas of Æschylus, though full of terrible interest, should be deficient in grace and softness; that his sublime conciseness should deviate sometimes into harshness and obscurity; that, finding it impossible to sustain himself at the height to which he had ascended, he should sometimes drop, "fluttering his pinions vain," into great inequalities of composition; and, finally, that his plots should appear rude and inartificial, contrasted with those of his successors in the dramatic art. Still, however, Æschylus led not only the way in the noble career of the Grecian drama, but outstripped, in point of sublimity at least, those by whom he was followed.

Sophocles, who obtained from his countrymen the title of the *Bee* of Attica, rivalled Æschylus when in the possession of the stage, and obtained the first prize. His success occasioned the veteran's retreat to Sicily, where he died, commanding that his epitaph should make mention of his share in the victory of Marathon, but should contain no allusion to his dramatic excellencies. His more fortunate rival judiciously avoided the dizzy and terrific path which Æschylus had trode with so firm and daring a step. It was the object of Sophocles to move sorrow and compassion, rather than to excite indignation and terror. He studied the progress of action with more attention than Æschylus, and excelled in that modulation of the story by which interest is excited at the beginning of a drama, maintained in its progress, and gratified at its conclusion. His subjects are also of a nature more melancholy and less sublime than those of his predecessor. He loved to paint heroes rather in their forlorn than in their triumphant fortunes, aware that the contrast offered new sources of the pathetic to the author. Sophocles was the most fortunate of the Greek tragedians. He attained the age of ninety-one years; and, in his eightieth, to vindicate himself from a charge of mental imbecility, he read to the judges his *Œdipus Coloneus*, the most beautiful, at least the most perfect, of his tragedies. He survived Euripides, his most formidable rival, of whom also we must say a few words.

Drama.

It is observed by Schlegel, that the tone of the tragedies of Euripides approaches more nearly to modern taste than to the stern simplicity of his predecessors. The passion of love predominates in his pieces, and he is the first tragedian who paid tribute to the passion which has been too exclusively made the moving cause of interest on the modern stage,—the first who sacrificed to

Cupid, king of gods and men.

The dramatic use of this passion has been purified in modern times, by the introduction of that tone of sentiment which, since the age of chivalry, has been a principal ingredient in heroic affection. This was unknown to the ancients, in whose society females, generally speaking, held a low and degraded place, from which few individuals emerged, unless those who aspired to the talents and virtues proper to the masculine sex. Women were not forbidden to become competitors for the laurel or oaken crown offered to genius and to patriotism; but antiquity held out no myrtle wreath as a prize for the domestic virtues peculiar to the female character. Love, therefore, in Euripides, does not always breathe purity of sentiment, but is stained with the mixture of violent and degrading passions. This, however, was the fault of the age rather than of the poet, although he is generally represented as an enemy of the female sex; and his death was ascribed to a judgment of Venus.

When blood-hounds met him by the way,
And monsters made the bard their prey.

This great dramatist was less happy than Sophocles in the construction of his plots; and, instead of the happy expedients by which his predecessor introduces us to the business of the drama, he had too often recourse to the mediation of a prologue, which came forth to explain in detail the previous history necessary to understand the piece.

Euripides is also accused of having degraded the character of his personages, by admitting more alloy of human weakness, folly, and vice, than was consistent with the high qualities of the heroic age. Æschylus, it was said, transported his audience into a new and more sublime race of beings; Sophocles painted mankind as they ought to be, and Euripides as they actually are. Yet the variety of character introduced by the latter tragedian, and the interest of his tragedies, must always attract the modern reader, coloured as they are by a tone of sentiment, and by his knowledge of the actual business, rules, and habits of actual life, to which his predecessors, living, as they did, in an imaginary and heroical world of their own, appear to have been strangers. And although the judgment of the ancients assigned the pre-eminence in tragedy to Æschylus or Sophocles, yet Euripides has been found more popular with posterity than either of his two great predecessors.

Grecian comedy.

The division betwixt tragedy and comedy, for both sprung from the same common origin, the feasts, namely, in honour of Bacchus, and the disguises adopted by his worshippers, seems to have taken place gradually, until the jests and frolics, which made a principal part of these revels, were found misplaced when introduced with graver mat-

ter, and were made by Susarion, perhaps, the subject of a separate province of the drama. The Grecian comedy was divided into the ancient, the middle, and the modern style of composition.

Ancient comedy.

The ancient and original comedy was of a kind which may, at first sight, appear to derogate from the religious purposes which we have pointed out as the foundation of the drama. They frequently turn upon parodies, in which the persons and adventures of those gods and heroes who were the sublime subjects of the tragic drama, are introduced for the purpose of buffoon-sport and ridicule, as in Carey's modern farces of *Midas* and the *Golden Pippin*. Hercules appears in one of those pieces astonishing his host by an extravagant appetite, which the cook in vain attempts to satiate, by placing before him, in succession, all the various dishes which the ancient kitchen afforded. In another comedy, Bacchus, in whose honour the solemnity was instituted, is brought in only in order to ridicule his extreme cowardice.

At other times, allowing a grotesque fancy its wildest range, the early comic authors introduced upon the stage animals, and even inanimate things, as part of their *dramatis personæ*, and embodied forth on the stage the fantastic imaginations of Lucian in his *True History*. The golden age was represented in the same ridiculous and bizarre mode of description as the *Pays de la Cocagne* of the French minstrels, or the popular ideas of *Lubber-land* in England; and the poets furnished kingdoms of birds, and worlds, in the moon.

Had the only charm of these entertainments consisted in the fantastic display with which the eyes of the spectators were regaled at the expense of the over-excited imagination of the poet, they would soon have fallen into disuse; for the Athenians were too acute and judicious critics to have been long gratified with mere extravagance. But these grotesque scenes were made the medium for throwing the most bold and daring ridicule upon the measures of the state, upon the opinions of individuals, and upon the religion of the country.

This propensity to turn into ridicule that which is most serious and sacred, had probably its origin in the rude gambols of the sylvan deities who accompanied Bacchus, and to whose petulant and lively demeanour rude jest was a natural accompaniment. The audience, at least the more ignorant part of them, saw these parodies with pleasure, which equalled the awe they felt at the performance of the tragedies, whose most solemn subjects were thus burlesqued; nor do they appear to have been checked by any sense that their mirth was profane. In fact, when the religion of a nation comes to consist chiefly in the practice of a few unmeaning ceremonies, it is often found that the populace, with whatever inconsistence, assume the liberty of profaning them by grotesque parodies, without losing their reverence for the superstitions which they thus vilify. Customs of a like tendency were common in the middle ages. The festival of the Ass in France, of the Boy-Bishop in England, of the Abbot of Unreason in Scotland, and many other popular practices of the same kind, exhibited, in countries yet Catholic, daring parodies of the most sacred services and ceremonies of the Roman church. And as these were practised openly, and under authority, without being supposed to shake the people's attachment to the rites which they thus ridiculed, we cannot wonder that similar profanities were well received among the Pagans, whose religion sat very loosely upon them, and who professed no fixed or necessary articles of faith.

It is probable that, had the old Grecian comedy continued to direct its shafts of ridicule only against the inhabitants of Olympus, it would not have attracted the coercion of the magistracy. But its province was far more extensive, the poets claiming the privilege of laying their opinions on public affairs before the people in this shape. Cratinus, Eupolis, and particularly Aristophanes, a daring, powerful, and apparently unprincipled writer, converted comedy into an engine for assailing the credit and character of private individuals, as well as the persons and political measures of those who administered the state. The doctrines of philosophy, the power of the magistrate, the genius of the poet, the rites proper to the deity, were alternately made the subject of the most uncompromising and severe satire. It was soon discovered that the more directly personal the assault could be made, and the more revered or exalted the personage, the greater was the malignant satisfaction of the audience, who loved to see wisdom, authority, and religious reverence brought down to their own level, and made subjects of ridicule by the powers of the merciless satirist. The use of the mask enabled Aristophanes to render his satire yet more pointedly personal; for, by forming it so as to imitate, probably with some absurd exaggeration, the features of the object of his ridicule, and by imitating the dress and manner of the original, the player stepped upon the stage a walking and speaking caricature of the hero of the night, and was usually placed in some ludicrous position, amidst the fanciful and whimsical chimeras with which the scene was peopled.

In this manner Aristophanes ridiculed with equal freedom Socrates, the wisest of the Athenians, and Cleon, the demagogue, when at the height of his power. As no one durst perform the latter part, for fear of giving offence to one so powerful, the author acted Cleon himself, with his face smeared with the lees of wine. Like the satire of Rabelais, the political and personal invective of Aristophanes was mingled with a plentiful allowance of scurril and indecent jests, which were calculated to insure a favourable reception from the bulk of the people. He resembles Rabelais also in the wild and fanciful fictions which he assumes as the vehicle of his satire; and his comedy of the Birds may even have given hints to Swift, when, in order to contrast the order of existing institutions with those of an Utopian and fantastic fairy land, he carries Gulliver among giants and pigmies. Yet though his indecency, and the offensive and indiscriminate scurrility of his satire, deserve censure;—though he merits the blame of the wise for his attack upon Socrates, and of the learned for his repeated and envenomed assaults on Euripides,—Aristophanes has nevertheless added one deathless name to the deathless period in which he flourished; and, from the richness of his fancy, and gaiety of his tone, has deserved the title of the Father of Comedy. When the style of his sarcasm possessed the rareness of novelty, it was considered of so much importance to the state, that a crown of olive was voted to the poet, as one who had taught Athens the defects of her public men. But unless angels were to write satires, ridicule cannot be considered as the test of truth. The temptation to be witty is just so much the more resistless, that the author knows he will get no thanks for suppressing the jest which rises to his pen. As the public becomes used to this new and piquant fare, fresh characters must be sacrificed for its gratification. Recrimination adds commonly to the contest, and those who were at first ridiculed out of mere wantonness of wit, are soon persecuted for resenting the ill usage; until literature resembles an actual personal conflict, where the victory is borne away by the strongest and most savage, who deals the most desperate wounds with the least sympathy for the feeling of his adversary.

The ancient comedy was of a character too licentious to be long tolerated. Two or three decrees having been

in vain passed, in order to protect the citizens against libels of this poignant description, the ancient comedy was finally proscribed by that oligarchy which assumed the government of Athens upon the downfall of the popular government towards the end of the Peloponnesian war. By order of these rulers, Anaxander, an actor, was punished capitally for parodying a line of Euripides, so as to infer a slight of the government. He was starved to death, to which, as an appropriate punishment, the public has since his time often indirectly condemned both actors and dramatists. Aristophanes, who was still alive, bowed to the storm, and relinquished the critical and satirical scourge which he had hitherto exercised in the combined capacity of satirist, reformer, and reviewer; and the use of the chorus was prohibited to comic actors, as it seems to have been in their stanzas chiefly that the offensive satire was invested. To this edict Horace alludes in the well known lines:

> Successit vetus his comœdia, non sine multa
> Laude: sed in vitium libertas excidit, et vim
> Dignam lege regi. lex est accepta, chorusque
> Turpiter obticuit, sublato jure nocendi.[1]

Middle comedy.

In the middle comedy, Thalia and her votaries seemed to have retraced their steps, and, avoiding personal satire, resorted once more to general subjects of burlesque raillery. We learn from history, real or fabulous, or from the works of the elder poets, that these plays had the fanciful wildness without the personal satire of the ancient comedy; for the authors were obliged to take care that there was no "offence" in their pleasantry. At most, they only ventured to touch on matters of instant interest in the way of inuendo, under feigned titles and oblique hints, and had no longer the audacity to join men's vices or follies to their names. Aristophanes re-cast several of his pieces in this manner. But the same food, without the poignant seasoning to which the audience had been accustomed, palled on their taste, and this cast of pieces soon gave place to that which the ancients called the New Comedy, so successfully cultivated by Menander and others.

New comedy.

Notwithstanding what modern critics have said to the contrary, and particularly the ingenious Schlegel, the new tone which comedy thus assumed seems more congenial to true taste as well as to public decorum, and even to the peace and security of the community, than that of Aristophanes, whose satiric wit, like a furious bull, charged upon his countrymen without respect or distinction, and tossed and gored whatever he met with in his way.

The new comedy had for its object the ludicrous incidents of private life (*celebrare domestica facta*, says Horace); to detail those foibles, follies, and whimsical accidents, which are circumstances material and serious to the agents themselves, but, as very usually happens on the stage of the world, matters only of ludicrous interest to the on-lookers. The new comedy admitted also many incidents of a character not purely ludicrous, and some which, calling forth pathetic emotion, approached more nearly to the character of tragedy than had been admitted in the ancient comedies of Aristophanes, and in this rather resembled what the French have called *Tragédie Bourgeoise.* It is scarce necessary to remark, that the line cannot be always distinctly drawn betwixt the subjects which excite mirth and those which call forth sympathy. It often happens that the same incident is at once affecting and ludicrous, or admits of being presented alternately in either point of view. In a drama, also, which treats of the faults and lighter vices, as well as of the follies of mankind, it is natural that the author should sometimes assume the high tone of the moralist. In these cases, to use the language of Horace, comedy exalts her voice, and the offended father, the pantaloon of the piece, swells into sublimity of language. A pleasant species of composition was thus attained, in which wit and humour were relieved by touches both of sentiment and moral instruction. The new comedy, taken in this enlarged point of view, formed the introduction to the modern drama; but it was neither so comprehensive in its plan, nor so various in character and interest.

General character of the new comedy.

The form which the Greeks, and in imitation of them the Romans, adopted, for embodying their comic effusions, was neither extended nor artificial. To avoid the charge of assaulting, or perhaps the temptation to attack private persons, the actors in their drama were rather painted as personifications of particular classes of society, than living individual characters. The list of these personages was sufficiently meagre. The principal character, upon whose devices and ingenuity the whole plot usually turns, is the *Geta* of the piece, a witty, roguish, insinuating, and malignant slave, the confident of a wild and extravagant son, whom he aids in his pious endeavours to cheat a suspicious, severe, and griping father. When to these three are added a wily courtezan, a procuress, a stolen virgin, who is generally a mute or nearly such, we have all the stock-characters which are proper to the classic comedy. Upon this limited scale of notes the ancients rung their changes, relieving them occasionally, however, by the introduction of a boastful soldier, a boorish clown, or a mild and good-natured old man, to contrast with the irascible Chremes of the piece, the more ordinary representative of old age.

The plot is in general as simple as the cast of the characters. A father loses his child, who falls into the hands of a procuress or slave merchant. The efforts of the youth, who falls in love with this captive, to ransom her from her captivity, are seconded by the slave, who aids him in the various devices necessary to extort from his father the funds necessary for the purchase, and their tricks form the principal part of the intrigue. When it is necessary that the play shall close, the discovery of the girl's birth takes place, and the young couple are married. The plots are indeed sometimes extended or enlarged by additional circumstances, but very seldom by any novelty of character or variety of general form.

It is a necessary consequence, that the ancient comic authors were confined within a very narrow compass. The vast and inexhaustible variety of knavery, folly, affectation, humour, &c. as mingled with each other, or as modified by difference of age, sex, temper, education, profession, and habit of body, are all within the royalty of the modern comic dramatist, and he may summon them up, under what limitations and in what circumstances he pleases, to play their parts in his piece. The ancients were much more limited in their circle of materials, and, perhaps, we must look for the ruling cause once more in the great size of their theatres, and to the use of the mask, which, though it easily presented the general or generic character of the personage introduced, was inca-

[1] The ancient comedy next play'd its part,
Well-famed, at first, for spirit and for art:
But Liberty o'erleaping decent awe,
Satiric rage required restraint from law;
The edict spoke, dishonour'd silence bound
The chorus, and forbade their ancient right to wound.

pable of the endless variety which can be given to ridicule of a more minute, refined, and personal kind, by the flexible organs of a modern actor.

But besides this powerful reason for refraining from any attempt to draw characters distinguished by peculiar habits, there is much reason to think that the mode of life pursued by the ancient Athenians was unfavourable to the formation of whimsical, original, or eccentric characters. Citizens of the same state, they lived much together, and the differences of ranks did not make the same distinction in taste and manners as in modern Europe Their occupation, also, was the same. They were all public men, and had a common interest in the management of the state; and it probably followed that, in men whose pursuits were all bent the same way, the same general similarity of manners might be found to exist, which is remarked in those who follow the same profession. The differences of youth and age, of riches and poverty, of good or bad temper, &c. must have been much modified in Attica, where all free citizens were, to a certain degree, on a level—discussed the same topics of state, and gave the same vote to forward them—enjoyed, without restriction, the same public amusements; and where the same general cast of manners might descend to the lowest of the citizens, for the very reason that even a poor herb-woman understood the delicacy of the Attic dialect so perfectly, as to distinguish a stranger by the first words he addressed to her.

The chorus, silenced, as we have seen, owing to the license of the old comedy, made no appendage to that which was substituted in its place. The exhibition of the Grecian comedy did not, in other respects, in so far as we know, materially differ from that of the tragedy. Instead of the choral interludes, the representation was now divided, by intervals of cessation, into acts, as upon the modern stage. And the number five seems to have been fixed upon as the most convenient and best adapted for the purposes of representation. The plot, as we have seen, and the distinct and discriminated specification of character, were, in either case, subordinate considerations to the force of style and composition. It follows, of consequence, that we can better understand and enjoy the tragedies than the comedies of the ancients. The circumstances which excite sublime or terrific sensations are the same, notwithstanding the difference of age, country, and language. But comic humour is of a character much more evanescent. The force of wit depends almost entirely upon time, circumstance, and manners, insomuch that a jest which raises inextinguishable laughter in a particular class of society, appears flat or disgusting if uttered in another. It is, therefore, no wonder that the ancient comedy, turning upon manners so far removed from our own time, should appear to us rather dull and inartificial. The nature of the intercourse between the sexes in classic times was also unfavourable for comedy. The coquette, the fine lady, the romp, all those various shades of the female character which occupy so many pleasant scenes on the modern stage, were totally unknown to ancient manners. The wife of the ancient comedy was a mere household drudge, the vassal, not the companion, of an imperious husband. The young woman whose beauty is the acting motive of the intrigue, never evinces the slightest intellectual property of any kind. And the only female character admitting of some vivacity is that of the courtezan, whose wit as well as her charms appeared to have been professional.

After subtracting the large field afforded by female art or caprice, female wit, or folly, or affection, the realm of the ancient comedy will appear much circumscribed; and we have yet to estimate a large deduction to be made on account of the rust of antiquity, and the total change of religion and manners. It is no wonder, therefore, that the wit of Plautus and Terence should come forth diminished in weight and substance, after having been subjected to the alembic of modern criticism. That which survives the investigation, however, is of a solid and valuable character. If these dramas do not entertain us with a display of the specific varieties of character, they often convey maxims evincing a deep knowledge of human passion and feeling; and are so admirably adapted to express, in few and pithy words, truths which it is important to remember, that even the Apostle Paul himself has not disdained to quote a passage from a Grecian dramatist. The situation, also, of their personages is often truly comic; and the modern writers who have borrowed their ideas, and arranged them according to the taste of their own age, have often been indebted to the ancients for the principal cause of their success.

Roman drama.

Having dwelt thus long upon the Grecian drama, we are entitled to treat with conciseness that of Rome, which, like the other fine arts, that people, rather martial than literary, copied from their more ingenious neighbours.

The Romans were not, indeed, without a sort of rude dramatic representation of their own, of the same nature with that which, as we have already noticed, usually arises in an early period of society. These were called *Fabulæ Atellanæ;* farces, for such they were, which took their name from *Atella*, a town belonging to the *Osci*, in Italy. They were performed by the Roman youth, who used to attack each other with satirical couplets during the intervals of some rude game, in which they seem to have represented the characters of fabulous antiquity. But, 361 years before the Christian era, the Romans, in the time of a great pestilence, as we learn from Livy, introduced a more regular species of theatrical entertainment, in order to propitiate the deities by a solemn exhibition of public games; after which, what had hitherto been matter of mere frolic and amusement, assumed, according to the historian, the appearance of a professional art; and the Roman youth, who had hitherto appeared as amateur performers, gave up the stage to regular performers.

These plays continued, however, to be of a very rude structure, until the Grecian stage was transplanted to Rome. Livius Andronicus, by birth a Grecian, led the way in this improvement, and is accounted her first dramatist.

Seneca the philosopher is the only Roman tragedian whose works have reached our time. But his tragedies afford no very favourable specimen of Roman art. They are in the false taste which succeeded the age of Augustus, and debased the style of composition in that of Nero; bombastic, tedious, and pedantic; treating, indeed, of Grecian subjects, but not with Grecian art.

By a singular contrast, although we have lost the more valuable tragedies of Rome, we have been compelled to judge of the new Greek comedy through the medium of the Latin translations. Of Menander we have but a few fragments, and our examples of his drama are derived exclusively from Plautus and Terence. Of these, the former appears the more original, the latter the more elegant author. The comedies of Plautus are much more connected with manners, much more full of what may be termed drollery and comic situation, and are believed to possess a greater portion of Roman character. The Romans, indeed, had two species of comedy, the *Palliata,* where the scene and dress were Grecian; the *Togata,* where both were Roman. But besides this distinction, even the *Mantled,* or Grecian comedy, might be more or less of a Roman cast; and Plautus is supposed to have

infused a much stronger national tone into his plays than can be traced in those of Terence. They are also of a ruder cast, and more extravagant, retaining, perhaps, a larger portion of the rough horse-play peculiar to the *Fabulæ Atellanæ*. Terence, on the contrary, is elegant, refined, and sententious; decorous and regular in the construction of his plots; exhibiting more of wit in his dialogue, than of comic force in his situations; grave often and moral, sometimes even pathetic; and furnishing, upon the whole, the most perfect specimens of the Grecian comedy, both in action and character.

The alterations which the Romans made in the practice of the theatrical art do not seem to have been of great consequence. One circumstance, however, deserves notice. The orchestra, or, as we should say, the pit of the theatre, was no longer left vacant for the occasional occupation of the chorus, but was filled with the senators, knights, and other more respectable citizens. The stage was thus brought more near to the eye of the higher class of the audience. It would also seem that the theatres were smaller; for we read of two so constructed that each turned upon a pivot, so that, when placed back to back, they were separate theatres, yet were capable of being wheeled round, with all the audience, so as to bring their oblong ends together, then forming a single amphitheatre, in which the games of the circus succeeded to dramatic representation. It is not easy to conceive the existence of such machinery; but the story, at any rate, seems to show that their theatres must have been greatly smaller than those of Greece, to admit the supposition of such an evolution as being in any degree practicable. This diminution in the size of the house, and the occupation of the orchestra by the most dignified part of the audience, may have afforded a reason why masks were, at least occasionally, disused on the Roman stage. That they were sometimes disused is certain; for Cicero mentions Roscius Gallus as using a mask to conceal a deformity arising from the inequality of his eyes, which implies plainly that other comedians played with their faces disclosed. It is therefore probable that the imperfections of the mask were felt so soon as the distance was diminished between the performer and the spectators; and we may hazard a conjecture that this disguise was first laid aside in the smaller theatres.

Degradation of the theatrical profession.

But the principal change introduced by the Romans into the drama, and which continues to affect it in every country of Europe, respected the *status* or rank of the actors in society. We have seen that Athens, enthusiastic in her attachment to the fine arts, held no circumstances degrading which were connected with them. Æschylus and Sophocles were soldiers and statesmen, yet lost nothing in the opinion of their countrymen by appearing on the public stage. Euripides, who was also a person of consequence, proved that "love esteems no office mean;" for he danced in a female disguise in his own drama, and that not as the Princess Nauticlea, but as one of her handmaidens, or, in modern phrase, as a *figurante*. The Grecians, therefore, attached no dishonour to the person of the actor, nor esteemed that he who contributed to giving the amusement of the theatre was at all degraded beneath those who received it. It was otherwise in Rome. The contempt which the Romans entertained for players might be founded partly upon their confounding this elegant amusement with the games of the circus and amphitheatre, performed by gladiators and slaves, the meanest, in short, of mankind. Hence, to use the words of St Augustine, "the ancient Romans, accounting the art of stage-playing and the whole scene infamous, ordained that this sort of men should not only want the honour of other citizens, but also be disfranchised and thrust out of their tribe, by a legal and disgraceful censure, which the censors were to execute; because they would not suffer their vulgar sort of people, much less their senators, to be defamed, disgraced, or defiled with stage-players;" which act of theirs he styles "an excellent true Roman prudence, to be enumerated among the Romans' praises."

Accordingly, an edict of the prætor stigmatized as infamous all who appeared on the stage, either to speak or act; but it is remarkable that from this general proscription the Roman youth were excepted; and they continued to enact the *Fabulæ Atellanæ*, namely, the farces or drolleries of ancient Italian origin, without incurring any stigma. This exception seems to indicate that the edict originated in the national pride of the Romans, and their contempt for Grecian literature, and for foreigners of every description. Under any other view it is impossible they should have preferred the actors in these coarse farces, who, by the bye, are supposed to have been the originals of no less persons that Harlequin and Punchinello, to those who possessed taste and talents sufficient to execute the masterly scenes borrowed from the Grecian drama.

Injustice, however, and we call that law unjust which devotes to general infamy any profession of which it nevertheless tolerates the practice, is usually inconsistent. Several individual play-actors in Rome rose to high public esteem, and to the enjoyment of great wealth. Roscius was the friend and companion of Piso and of Sylla, and, what was still more to his credit, of Cicero himself, who thus eulogises the scenic art, while commemorating the merit of his deceased friend: *Quis nostrûm tam animo agresti ac duro fuit, ut Roscii morte nuper non commoveretur? qui quum esset senex mortuus, tamen, propter excellentem artem ac venustatem, videbatur omnino mori non debuisse.*

Paris, another Roman actor, reached a height of celebrity as distinguished as Roscius, and exercised, as many of his profession have since done, an arbitrary authority over the unfortunate dramatic authors. It is recorded by the satirist that Statius the epic poet might have starved had he not given up to this favourite of the public, upon his own terms doubtless, the manuscript of an unacted performance. Paris was put to death by Domitian out of jealousy.

If the actors rose to be persons of importance in Rome, the dramatic critics were no less so. They had formed a code of laws for the regulation of dramatic authors, to which the great names of Aristotle and Horace both contributed their authority. But these will be more properly treated of when we come to mention their adoption by the French stage.

Decay and disrepute of the ancient stage.

Having thus hastily given some account of the ancient stage, from its rise in Greece to its transportation to Rome, we have only to notice the circumstances under which it expired.

Christianity from its first origin was inimical to the institution of the theatre. The fathers of the church inveigh against the profaneness and immodesty of the theatre. In the treatise of Tertullian, *De Spectaculis*, he has written expressly upon the subject. The various authorities on this head have been collected and quoted by the enemies of the stage, from Prynne down to Collier. It ought, however, to be noticed, that their exprobation of the theatre is founded, first, upon its origin, as connected with heathen superstition; and secondly, on the beastly and abominable license practised in the pantomimes, which, although they made no part of the regular drama, were presented nevertheless in the same place, and before the same audience. "We avoid your shows and games," says Tertullian, "be-

cause we doubt the warrant of their origin. They savour of superstition and idolatry, and we dislike the entertainment, as abhorring the heathen religion on which it is founded." In another place he observes, the temples were united to theatres, in order that superstition might patronize debauchery; and that they were dedicated to Bacchus and to Venus, the confederate deities of lust and intemperance.

It was not only the connection of the theatre with heathen superstition that offended the primitive church, but also the profligacy of some of the entertainments which were exhibited. There cannot be much objected to the regular Roman dramas in this particular, since even Mr Collier allows them to be more decorous than the British stage of his own time; but, as we have already hinted, in the *Ludi Scenici*, the intrigues of the gods and the heroes were represented upon the stage with the utmost grossness. These obscene and scandalous performances thus far coincided with the drama, that they were acted in the same theatres, and in honour of the same deities, and both were subjected to the same sweeping condemnation. They were not, however, absolutely or formally abolished, even when Christianity became the religion of the state. Tertullian and St Augustin both speak of the scenic representations of their own day, under the distinct characters of tragedy and comedy; and although condemned by the church, and abhorred by the more strict Christians, there is little doubt that the ancient theatre continued to exist until it was buried under the ruins of the Roman empire.

Modern Drama.

Dramatic representations of the middle ages.

The same proneness to fictitious personification, which we have remarked as a propensity common to all countries, introduced, during the dark ages, a rude species of drama into most of the nations of Europe. Like the first efforts of the ancients in that art, it had its foundation in religion; with this great difference, that as the rites of Bacchus before, and even after the improvements introduced by Thespis, were well enough suited to the worship of such a deity, the religious dramas, mysteries, or whatever other name they assumed, were often so unworthy of the Christian religion, on which they were founded, that their being tolerated can be attributed only to the gross ignorance of the laity, and the cunning of the Catholic priesthood, who used them, with other idle and sometimes indecorous solemnities, as one means of amusing the people's minds, and detaining them in contented bondage to their spiritual superiors.

In the empire of the East, religious exhibitions of a theatrical character appear to have been instituted about the year 990, by Theophylact, patriarch of Constantinople, with the intention, as Warton surmises, of weaning the minds of the people from the Pagan revels, by substituting Christian spectacles, partaking of the same spirit of license. His contemporaries give him little credit for his good intentions. "Theophylact," says Cedrenus, as translated by Warton, "introduced the practice, which prevails to this day, of scandalizing God and the memory of his saints, on the most splendid and popular festivals, by indecent and ridiculous songs, and enormous shoutings, even in the midst of those sacred hymns which we ought to offer to divine grace for the salvation of our souls. But he having collected a company of base fellows, and placing over them one Euthynicus, surnamed Casnes, whom he also appointed the superintendent of his church, admitted into the sacred service diabolical dances, exclamations of ribaldry, and ballads borrowed from the streets and brothels." The irregularities of the Greek clergy, who, on certain holidays, personated feigned characters, and entered even the choir in masquerade, are elsewhere mentioned. (Warton's *History of English Poetry*, vol. ii. p. 370.) These passages do not prove that actual mysteries or sacred dramas were enacted on such occasions; but probably the indecent revels alluded to bore the same relation to such representations, as the original rites of Bacchus to the more refined exhibitions of Thespis and Susarion.

There has been some dispute among theatrical antiquaries, in which country of Europe dramatic representations of a religious kind first appeared. The liberal and ingenious editor of the *Chester Mysteries* has well remarked, in his introduction to that curious and beautiful volume, that a difficulty must always attend the inquiry, from the doubts that exist, whether the earliest recorded performances of each country were merely pantomimes, or were accompanied with dialogue.

The practice of processions and pageants with music, in which characters, chiefly of sacred writ, were presented before the public, is so immediately connected with that of speaking exhibitions, that it is difficult to discriminate the one from the other.

We are tempted to look first to Italy; as it is natural that the tragic art should have revived in that country in which it was last exercised, and where traditions, and perhaps some faint traces, of its existence were still preserved.

"The first speaking sacred drama," says Mr Walker, "was *Della Passione di nostro Signor Giesù Christo*, by Giuliano Dati, bishop of San Leo, who flourished about the year 1445." (Walker's *Essay on the Revival of the Drama in Italy*, p. 6.) This elegant author does, indeed, show that Italian scholars, and particularly Mussato, the Paduan historian, had composed two Latin dramas upon something like the classical model about the year 1300. Yet, although his play upon the tyranny and death of Ezzlino obtained him both reputation and honour, it does not appear to have been composed for the stage, but rather to have been a dramatic poem, since the progress of the piece is often interrupted by the poet speaking in his own person.

The French drama is traced by M. Legrand as high as the thirteenth century; and he has produced one curious example of a pastoral entitled *Un Jeu*. He mentions also a farce, two devotional pieces, and two moralities, to each of which he ascribes the same title. It may be suspected that these are only dialogues recited by the travelling minstrels and troubadours, such as Petrarch acknowledges having sometimes composed for the benefit of the strolling musicians. Such were probably the spectacles exhibited by Philip the Fair in 1313, on account of the honour of knighthood conferred on his children. Riccoboni, anxious for the honour of Italy, denies to these amusements the character of a legitimate drama; with what justice we have no information that can enable us to decide.

Amidst this uncertainty, it is not unpleasant to record the fair claim which Britain possesses to be one of the earliest, if not the very first nation in which dramatic representation seems to have been revived. The *Chester Mysteries*, called the *Whitsun Plays*, appear to have been performed during the mayoralty of John Arneway, who filled that office in Chester from 1268 to 1276. The very curious specimen of these mysteries, which has been of late printed for private distribution by Mr Markland of the Temple, furnishes us with the banes or proclamation, containing the history and character of the pageants which it announces.

Reverende lordes and ladyes all,
That at this tyme here assembled bee,
By this messauge understande you shall,
That sometymes there was mayor of this citie,

Sir John Arnway, Knyghte, who most worthilye
Contented hymselfe to sett out an playe
The devise of one Done Rondali, moonke of Chester Abbey.

This moonke, moonke-like in scriptures well seene,
In storyes travelled with the best sorte;
In pagentes set fourth, apparently to all eyne,
The Olde and Newe Testament with livelye comforte;
Intermynglinge therewith, onely to make sporte,
Some things not warranted by any writt,
Which to gladd the hearers he woulde men to take yt.

This matter he abrevited into playes twenty-foure,
And every playe of the matter gave but a taste,
Leavinge for better learninge scircumstances to accomplishe,
For his proceedinges maye appeare to be in haste:
Yet all together unprofitable his labour he did not waste,
For at this daye, and ever, he deserveth the fame
Which all monkes deserves professinge that name.

This worthy Knihte Arnway, then mayor of this citie,
This order toke, as declare to you I shall,
That by twentye-fower occupations, artes, craftes, or misteries,
These pagentes shoulde be played after breeffe rehearsall;
For every pagente a cariage to be provyded withall,
In which sorte we purpose this Whitsontyde,
Our pageants into three partes to devyde.

I. Now you worshippfull TANNERS that of custome olde
The fall of Lucifer did set out,
Some writers awarrante your matter, therefore be boulde
Lustelye to playe the same to all the rowtte:
And yf any thereof stand in any doubte.
Your author his author hath, your shewe let bee,
Good speech, fyne players, with apparill comelye.

Chester Mysteries.

Such were the celebrated Mysteries of Chester. To Mr Markland's extracts from them is prefixed a curious dissertation upon their age and author. They were so highly popular, as to be ranked, in the estimation of the vulgar, with the ballads of Robin Hood; for a character in one of the old moralities is introduced as boasting,

I can rhimes of Robin Hood, and Randal of Chester,
But of our Lord and our Lady I can nought at all.

The poetical value of these mysteries is never considerable, though they are to be found among the dramatic antiquities of all parts of Europe. It was, however, soon discovered that the purity of the Christian religion was inconsistent with these rude games, in which passages from scripture were profanely and indecently mingled with human inventions of a very rude, and sometimes an indecorous character. To the Mysteries, therefore, succeeded the Moralities, a species of dramatic exercise, which involved more art and ingenuity, and was besides much more proper for a public amusement, than the imitations or rather parodies of sacred history, which had hitherto entertained the public.

Moralities. These Moralities bear some analogy to the old or original comedy of the ancients. They were often founded upon allegorical subjects, and almost always bore a close and poignant allusion to the incidents of the day. Public reformation was their avowed object, and, of course, satire was frequently the implement which they employed. Dr Percy, however, remarks that they were of two characters, serious and ludicrous; the one approaching to the tragedy, the other to the comedy of classical times; so that they brought taste as it were to the threshold of the real drama. The difference between the Catholic and reformed religion was fiercely disputed in some of these dramas; and in Scotland, in particular, a mortal blow was aimed at the superstitions of the Roman church, by the celebrated Sir David Lindsay, in a play or morality acted in 1539, and entitled *The Satire of the Three Estates.* The objects of this drama were entirely political, although it is mixed with some comic scenes, and introduced by an interlude, in coarseness altogether unmatched. The spirit of Aristophanes, in all its good and evil, seems to have actuated the Scottish king-at-arms. It is a singular proof of the liberty allowed to such representations at the period, that James V. and his queen repeatedly witnessed a piece, in which the corruptions of the existing government and religion were treated with such satirical severity. The play, as acted, seems to have differed in some respects from the state in which it exists in manuscript.

In a letter to the Lord Privy Seal of England, dated 26th January 1540, Sir William Eure (envoy from Henry VIII.) gives the following account of the play, as it had then been performed "in the feast of Ephipanie at Lightgowe, before the king, queene, and the whole counsaile, spirituall and temporall. In the firste entres come in SOLACE (whose parte was but to make mery, sing ballets with his fellowes, and drinke at the interluydes of the play), whoe showed firste to all the audience the play to be played. Next come in a king, who passed to his throne, having nae speche to thende of the play, and then to ratify and approve, as in parliament, all things done by the rest of the players, which represented THE THREE ESTATES. With hym came his cortiers, PLACEBO, PICTHANK, and FLATTERYE, and sic alike gard; one swering he was the lustiest, starkeste, best proportionit, and most valyeant man that ever was; ane other swere he was the beste with long-bowe, crosse-bowe, and culverin, and so fourth. Thairafter there come a man armed in harness, with a swerde drawn in his hande, a BUSHOP, a BURGESMAN, and EXPERIENCE, clede like a DOCTOR; who set them all down on the deis under the KING. After them come a POOR MAN, who did go up and down the scaffolde, making a hevie complainte that he was hereyet, throw the courtiers taking his fewe in one place, and his tackes in another; wherthrough he had sceyled his house, his wyfe and childrene beggyng thair brede, and so of many thousands in Scotland; saying thair was no remedy to be gotten, as he was neither acquainted with controller nor treasurer. And then he looked to the king, and said he was not king in Scotland, for there was ane other king in Scotland that hanged JOHNE ARMSTRANG, with his fellowes, SYM THE LAIRD, and mony other mae; but he had lefte ane thing undone. Then he made a long narracione of the oppression of the poor, by the taking of the corsepresaunte beists, and of the herrying of poor men by the consistorye lawe, and of many other abusions of the SPIRITUALITIE and Church. Then the BUSHOP raise and rebuked him. Then the MAN OF ARMES alledged the contraire, and commanded the poor man to go on. The poor man proceeds with a long list of the bishop's evil practices, the vices of cloisters, &c. This is proved by EXPERIENCE, who, from a New Testament, shows the office of a bushop. The MAN OF ARMES and the BURGES approve of all that was said against the clergy, and alledge the expediency of a reform, with the consent of parliament. The BUSHOP dissents. The MAN OF ARMES and the BURGES said they were two, and he but one, wherefore their voice should have most effect. Thereafter the king, in the play, ratified, approved, and confirmed all that was rehersed."

The other nations of Europe, as well as England, had their mysteries and moralities. In France, Boileau, following Menestrier, imputes the introduction of these spectacles to travelling bands of pilgrims.

Chez nos dévots ayeux, le théâtre abhorré
Fut long-temps dans la France un plaisir ignoré;
Des pélerins dit-on, une troupe grossière
En public à Paris y monta la première;
Et sottement zélée en sa simplicité
Joüa les saints, la Vierge, et Dieu par piété.

L'Art Poetique, chant. iii.

Drama.

In Spain the *Autos Sacramentales*, which are analogous to the mysteries of the middle ages, are still presented without shocking a nation whose zeal is stronger than their taste; and, it is believed, such rude and wild plays, founded on scripture, are also occasionally acted in Flanders. In the *History of the Council of Constance*, we find that mysteries were introduced into Germany by the English, about 1417, and were first performed to welcome the Emperor Sigismund, on his return from England; and, from the choice of the subjects, we should almost suppose that they had transferred to that country the *Chester Mysteries* themselves. "Les Anglois," says the historian, "se signalè ent entre les autres par un spectacle nouveau, ou au moins inusité jusques alors en Allemagne. Ce fut une comédie sacrée, que les evêques Anglois firent représenter devant l'empéreur, le Dimanche 31 de Janvier, sur la Naissance du Sauveur, sur l'Arrivée des Mages, et sur la Massacre des Innocens." (*Hist. du Concile de Constance*, par L'Enfant, lib. v.) The character of these rude dramatic essays renders them rather subjects for the antiquary than a part of a history of the regular dramatic art.

Latin plays.

We may also pass over, with brief notice, the Latin plays which, upon the revival of letters, many of the learned composed in express imitation of the ancient Grecian and Latin productions. We have mentioned those of Mussato, who was followed by the more celebrated Cararo, in the path which he had opened to fame. In other countries the same example was followed. These learned prolusions, however, were only addressed to persons of letters, then a very circumscribed circle, and, when acted at all, were presented at universities or courts on solemn public occasions. They form no step in the history of the drama, unless that, by familiarizing the learned with the form and rules of the ancient classical drama, they gradually paved the way for the adoption of the same regulations into the revived vernacular drama, and formed a division amongst the theatres of modern Europe, which has never yet been reconciled.

Historical plays.

While the learned laboured to revive the classical drama in all its purity, the public at large, to which the treasures of the learned languages were as a fountain sealed, became addicted to a species of representation which properly neither fell under the denomination of comedy or tragedy, but was named History or Historical Drama. Charles Verardo, who, about 1492, composed a drama of this sort, in Latin, upon the expulsion of the Moors from Granada, claims, for this production, a total emancipation from the rules of dramatic criticism.

> Requirat autem nullus hic comœdiæ,
> Leges ut observantur, aut tragediæ;
> Agenda nempe est *historia* non fabula.

"Let none expect that in this piece the rules of comedy or of tragedy should be observed; we mean to act a history, not a fable." From this expression it would seem that, in a historical drama, the author did not think himself entitled to compress or alter the incidents as when the plot was fabulous, but was bound, to a certain extent, to conform to the actual course of events. In these histories, the poet embraced often the life and death of a monarch, or some other period of history, containing several years of actual time, which, nevertheless, were made to pass before the eyes of the audience during the two or three hours usually allotted for the action of a play. It is not to be supposed that, with so fair a field open before them, and the applause of the audience for their reward, the authors of these histories should long have confined themselves to the matter of fact contained in records. They speedily innovated or added to their dramatic chronicles without regard to the real history. To those who plead for stage plays, that they elucidate and explain many dark and obscure histories, and fix the facts firmly in the minds of the audience, of which they had otherwise but an imperfect apprehension, the stern Prynne replies with great scorn, "that play-poets do not explain, but sophisticate and deform, good histories, with many false varnishes and playhouse fooleries;" and that "the histories are more accurately to be learned in the original authors who record them, than in derivative playhouse pamphlets, which corrupt them." (Prynne's *Histrio-Mastix*, p. 940.)

The dramatic chronicles, therefore, were a field in which the genius of the poet laboured to supply, by character, sentiment, and incident, the meagre detail of the historian. They became so popular in England, that, during the short interval betwixt the revival of the stage and the appearance of Shakspeare, the most part of the English monarchs had lived and died upon the stage; and it is well known that almost all his historical plays were new written by him, upon the plan of old dramatic chronicles which already existed.

But the miscellaneous audience which crowded to the vernacular theatre at its revival in Europe, were of that rank and intellect which is apt to become tired of a serious subject, and to demand that a lamentable tragedy should be intermingled with very pleasant mirth. The poets, obliged to cater for all tastes, seldom failed to insert the humours of some comic character, that the low or grotesque scenes in which he was engaged might serve as a relief to the graver passages of the drama, and gratify the taste of those spectators who, like Christofero Sly, tired until the fool came on the stage again. Hence Sir Philip Sidney's censure on these dramatists, "how all their plays be neither right tragedies nor right comedies, mingling kings with clowns; not because the matter so carrieth it, but to thrust in the clown, by head and shoulders, to play a part in magestical matters, with neither decency nor discretion, so that neither the admiration and commiseration, nor the right sportfulness, is by their mongrel tragi-comedy attained." (*Defence of Poesie.* Sidney's *Arcadia*, edit. 1627, p. 563.) "If we mark them well," he concludes, "funerals and hornpipes seldom match daintily together."

Romantic drama.

The historical plays led naturally into another class, which may be called Romantic Dramas, founded upon popular poems or fictitious narratives, as the former were on real history. Some of these were borrowed from foreign nations, ready dramatized to the hand of the borrower; others were founded on the plots which occurred in the almost innumerable novels and romances which we had made our own by translation. "I may boldly say it," says Gosson, a recreant play-wright, who attacked his former profession, "because I have seen it, that the *Palace of Pleasure*, the *Golden Asse*, the *Ethiopian History*, *Amadis of Fraunce*, the *Round Table*, *Bawdie Comedies in Latin, French, Italian, and Spanish*, have been thoroughly ransacked to furnish the playhouse in London." But it was not to be supposed that the authors would confine themselves to stricter rules in pieces founded upon Italian and Spanish novels, or upon romances of chivalry, than they had acted upon in the histories. Every circumstance which tended to loosen the reins of theatrical discipline in the one case, existed in the other; and, accordingly, comedies of intrigue, and tragedies of action and show, everywhere superseded, at least in popular estimation, the severe and simple model of the classical drama.

It happened that in England and Spain, in particular, the species of composition which was most independent of critical regulation was supported by the most bril-

liant display of genius. Lopez de Vega and Calderon rushed on the stage with their hasty and high-coloured, but glowing productions, fresh from the mint of imagination, and scorning that the cold art of criticism should weigh them in her balance. The taste of the Spaniards has been proverbially inclined to the wild, the romantic, and the chivalrous; and the audience of their bards would not have parted with one striking scene, however inartificially introduced, to have gained for their favourites the praise of Aristotle and all his commentators. Lopez de Vega himself was not ignorant of critical rules; but he pleads the taste of his countrymen as an apology for neglecting those restrictions which he had observed in his earlier studies.

> Yet true it is I too have written plays,
> The wiser few, who judge with skill, might praise;
> But when I see how show and nonsense draws
> The crowds, and, more than all, the fair's applause;
> Who still are forward with indulgent rage
> To sanction every monster of the stage;
> I, doom'd to write the public taste to hit,
> Resume the barbarous dress 'twas vain to quit;
> I lock up every rule before I write,
> Plautus and Terence banish from my sight,
> Lest rage should teach these injured wits to join,
> And their dumb books cry shame on works like mine.
> To vulgar standards, then, I frame my play,
> Writing at ease, for, since the public pay,
> 'Tis just, methinks, we by their compass steer,
> And write the nonsense that they love to hear.
>
> Lord Holland's *Life of Lope de Vega*, p. 103.

The Spanish comedies of intrigue also went astray, as far as their romantic tragedies, from the classical path. In fact, these new representations were infinitely more captivating from their vivacity, novelty, and, above all, from their reflecting the actual spirit of the time, and holding the mirror up to nature, than the cold imitations which the learned wrote in emulation of the classic drama. The one class are existing and living pictures of the times in which the authors lived; the others, the cold resurrection of the lifeless corpses which had long slumbered in the tomb of antiquity. The spirit of chivalry, which so long lingered in Spain, breathes through the wild and often extravagant genius of her poets. The hero is brave and loyal, and true to his mistress:

> A knight of love who never broke a vow.

Lovers of this description, in whose minds the sexual passion is sublimated into high and romantic feeling, make a noble contrast with the coarse and licentious Greek or Roman, whose passion turns only on the difficulty of purchasing his mistress's person, but who never conceives the slightest apprehension concerning the state of her affections.

That the crowd might have their loud laugh, a *grazioso* or clown, usually a servant of the hero, is in the Spanish drama uniformly introduced to make sport. Like Kemp or Tarletun, famous in the clown's part before the time of Shakspeare, this personage was permitted to fill up his part with extemporary jesting, not only on the performers, but with the audience. This irregularity, with others, seems to have been borrowed by the English stage from that of Spain, and is the license which Hamlet condemns in his instructions to the players: " And let those that be your clowns speak no more than is set down for them; for there be of them that will themselves laugh, to set on some quantity of barren spectators to laugh too, though, in the mean time, some necessary question of the play be then to be considered; that's villainous, and shows a most pitiful ambition in the fool that uses it."

The bald simplicity of the ancient plots was, in like manner, contrasted to disadvantage with the intricacies, involutions, suspense, and bustle of Spanish intrigue upon the stage. Hence the boast of one of their poets, thus translated by Lord Holland:

> Invention, interest, sprightly turns in plays,
> Say what they will, are Spain's peculiar praise;
> Her's are the plots which strict attention seize,
> Full of intrigue, and yet disclosed with ease.
> Hence acts and scenes her fertile stage affords,
> Unknown, unrivall'd, on the foreign boards.
>
> *Life of Lope de Vega*, p. 106.

While we admire the richness of fancy displayed in the Spanish pieces, it is impossible, in an age of refinement, to avoid being shocked by their wilful and extravagant neglect of every thing which can add probability to the action of their drama. But the apology for this license is well pleaded by Lord Holland.

" Without dwelling on the expulsion of the chorus (a most unnatural and inconvenient machine), the moderns, by admitting a complication of plot, have introduced a greater variety of incidents and character. The province of invention is enlarged; new passions, or at least new forms of the same passions, are brought within the scope of dramatic poetry. Fresh sources of interest are opened, and additional powers of imagination called into activity. Can we then deny what extends its jurisdiction, and enhances its interest, to be an improvement in an art whose professed object is to stir the passions by the imitation of human actions? In saying this I do not mean to justify the breach of decorum, the neglect of probability, the anachronisms, and other extravagancies of the founders of the modern theatre. Because the first disciples of the school were not models of perfection, it does not follow that the fundamental maxims were defective. The rudeness of their workmanship is no proof of the inferiority of the material; nor does the want of skill deprive them of the merit of having discovered the mine. The faults objected to them form no necessary part of the system they introduced. Their followers in every country have either completely corrected or gradually reformed such abuses. Those who bow not implicitly to the authority of Aristotle, yet avoid such violent outrages as are common in our early plays. And those who pique themselves on the strict observance of his laws, betray, in the conduct, the sentiments, the characters, and the dialogue of their pieces (especially of their comedies), more resemblance to the modern than the ancient theatre; their code may be Grecian, but their manners, in spite of themselves, are Spanish, English, or French. They may renounce their pedigree, and even change their dress, but they cannot divest their features of a certain family-likeness to their poetical progenitors."

In France the irregularities of the revived drama were of a lower complexion; for, until her stage was refined by Corneille, and brought under its present strict *regime*, it was adorned by but little talent; a circumstance which, amongst others, may account for the ease with which she subjected herself to critical rules, and assumed the yoke of Aristotle. Until she assumed the Grecian forms and restrictions, there is but little interesting in the history of her stage.

England adopted the historical and romantic drama with ardour, and in a state scarce more limited by rules than that of Spain herself. Her writers seem early to have ransacked Spanish literature; for the union of the countries during the short reign of Mary, nay even their wars under Elizabeth and Philip, made them acquainted with each other. The Spaniards had the start in the revival of the drama. *Ferrex and Perrex*, our earliest tragedy, was first presented in 1561; and *Gammer Gurton's*

Needle, our first comedy, in 1575; whereas Lopez de Vega, who was not by any means the earliest Spanish dramatist, died in 1562, leaving the stage stocked with his innumerable productions, to which his contemporaries had not failed to add their share. Thus, as soon as the stage of Britain was so far advanced as to be in a capacity of borrowing, that of Spain offered a fund to which her authors could have recourse; and, in fact, the Spanish drama continued to be a mine in which the British poets collected materials, often without acknowledgment, during all the earlier part of her dramatic history. From this source, as well as from the partialities of the audience, arose that early attempt at show and spectacle, at combats and marvellous incidents, which, though with very poor means of representation, our early dramatic poets loved to produce at the Bull or the Fortune playhouses. The extravagance of their plots, and the poor efforts by which our early dramatists endeavoured to represent show and procession, did not escape the censure of Sir Philip Sidney, who, leaning to the critical reformation which was already taking place in Italy, would gladly have seen our stage reduced to a more classical model.

"It is faultie," says that gallant knight, "both in place and time, the two necessarie companions of all corporall actions. For the stage should alway present but one place; and the uttermost time presupposed in it should bee, both by *Aristotle's* precept and common reason, but one day; there are both many dayes and many places inartificially imagined. But if it be so in *Gorboduke*, how much more in all the rest? where you shall have *Asia* of the one side, and *Affricke* of the other, and so many other under kingdomes, that the plair, when he comes in, must ever begin with telling where hee is, or else the tale will not be conceived. Now shall you have three ladies walke to gather flowers, and then wee must beleeve the stage to be a garden. By and by wee heare newes of shipwracke in the same place, then wee are to blame if we accept it not for a rocke. Upon the backe of that comes out a hideous monster with fire and smoke, and then the miserable beholders are bound to take it for a cave; while, in the mean time, two armies flie in, represented with some swordes and bucklers, and then what hard heart will not receive it for a pitched field? Now of time they are much more liberall; for ordinarie it is, that two young princes fall in love. After many traverses shee is got with childe, delivered of a faire boy; he is lost, groweth a man, falleth in love, and is readie to get another childe, and all this in two houres space; which how absurd it is in sense, even sense may imagine, and art hath taught, and all ancient examples justified, and at this day the ordinary players in *Italy* will not err in."

Italian tragedy.

Italy, referred to by Sir Philip Sidney as the cradle of the reformed drama, had had her own age of liberty and confusion; her mysteries, her moralities, her historical and her romantic dramas. But the taste for the ancient and classical stage was still rooted in the country where it had flourished, and Trissino is acknowledged as the father of the regular drama. The *Sophonisba* of this learned prelate is praised by Voltaire as the first regular tragedy which Europe had seen after so many ages of barbarism. Pope has added his tribute.

> When learning, after the long Gothic night,
> Fair o'er the western world renewed its light,
> With arts arising, Sophonisba rose,
> The tragic muse returning wept her woes;
> With her the Italian scene first learned to glow,
> And the first tears for her were taught to flow.

This tragedy was represented at Rome in the year 1515. The Greek model is severely observed, and the author has encumbered his scene with a chorus. It has some poetic beauties, and is well calculated to recommend the new or rather revived system on which it was written. *La Rosmonda* of Rucelleri was written about the same time with *Sophonisba;* and, after these pieces, tragi-comedies, histories, and romantic dramas, were discarded, and succeeded by tragedies upon a regular classical model; written in verse, having five acts, and generally a chorus.

Notwithstanding their rigorous attention to the ancient model, the modern tragic poets of Italy have not been very successful in arresting the attention of their countrymen. They are praised rather than followed; and the stern, unbending composition of Alfieri, while it has given a tone of rude and stoical dignity to his dramas, has failed in rendering them attractive. They frequently please in the closet; but the audience of modern days requires to be kept awake by something more active, more bustling, more deeply interesting, than the lessons of the schools; and a poet of high fancy has written in some measure in vain, because he has mistaken the spirit of his age. The tragic actors, also, whatever excellence they may attain to in their art, do not attract the same consideration, attention, and respect, as in France or England; and they who are the direct authors of a pleasure so nearly connected with our noblest and best feelings, occupy a rank subordinate to the performers at the opera.

Opera.

It is only as a modification of the drama that we here propose to touch upon that entertainment of Italian growth, but known by importation in every civilized kingdom of Europe. These kingdoms have often rivalled each other in the rewards held forth to musical performers, and encouraged their merit by a degree of profusion, which has had the effect of rendering the professors petulant, capricious, and unmanageable. Their high emoluments are not granted, or their caprices submitted to, without a degree of pleasure in some degree corresponding to the expense and the sufferance; and it is in vain for the admirers of the legitimate drama to pretend that such is not obtained. Voltaire has with more justice confessed, that probably the best imitation of the ancient stage was to be found in the Italian tragic opera. The recitative resembled the musical declamation of the Athenians, and the choruses, which are frequently introduced, when properly combined with the subject, approach to those of the Greeks, as forming a contrast, by the airs which they execute, to the recitative, or modulated dialogue of the scene. Voltaire instances the tragic operas of Metastasio in particular, as approaching in beauty of diction, and truth of sentiment, near to the ancient simplicity; and finds an apology even for the detached airs, so fatal to probability, in the beauty of the poetry and the perfection of the music. And although, as a critic and man of cultivated taste, this author prefers the regular, noble, and severe beauties of the classic stage, to the effeminate and meretricious charms of the opera, still he concludes that, with all its defects, the sort of enchantment which results from the brilliant intermixture of scenery, chorus, dancing, music, dress, and decoration, subjects even the genius of criticism; and that the most sublime tragedy, and most artful comedy, will not be so frequently revisited by the same individual as an indifferent opera. We may add the experience of London to the testimony of this great critic; and, indeed, were it possible that actors could frequently be procured, possessed of the powers of action and of voice which were united in Grassini, it would be impossible to deny to the opera the praise of being an amusement as exquisite in point of taste as fascinating from show and music. But as the musical parts of the entertainment are predominant, every thing else has been too often sacrificed to the caprice of a composer, wholly igno-

Drama.

rant in every art save his own; and the mean and paltry dialogue, which is used as a vehicle for the music, is become proverbial to express nonsense and inanity.

Italian comedy.

The Italian comedy, as well as their tragedy, boasts its regular descent from classical times. Like the comedy of Menander, it introduces *dramatis personæ* whose characters are never varied, and some of whom are supposed to be directly descended from the ancient *Mimi* of the Atellan Fables. Such an origin is claimed for the celebrated Harlequin, and for the no less renowned Puncinello, our English Punch, both of whom retain the character of jesters, cowards, wags, and buffoons, proper to the *Sannio* of the Romans. It is believed of these worthies that they existed before the time of Plautus, and continued to play their frolics during the middle ages, when the legitimate drama was unknown. For the former fact, sculpture, as well as tradition, is appealed to by Italian antiquaries, who have discovered the representation of these grotesque characters upon the Etruscan vases. In support of the latter averment, the grave authority of Saint Thomas Aquinas is appealed to, who, we rejoice to find, thought Harlequin and Punch no unlawful company in fitting time and place. "*Ludus*," says that eminent person, with more consideration for human infirmity than some saints of our own day, "*est necessarius ad conversationem vitæ humanæ: ad omnia autem quæ sunt utilia conversationi humanæ, deputari possunt aliqua officia licita: et ideo etiam officium histrionum quod ordinatur ad solatium hominibus exhibendum, non est secundum se illicitum, nec sunt histriones in statu peccati, dummodo moderate ludo utantur; id est, non utendo aliquibus illicitis verbis vel factis, ad ludum, et non adhibendo ludum negotiis et temporibus indebitis, unde illi qui moderate eis subveniunt, non peccant, sed juste faciunt mercedem ministerii eorum eis tribuendo. Et licet D. August.* super Joan. *dicit quod donare res suas histrionibus, vitium est immane, hoc intelligi debet de illis qui dant histrionibus qui in ludo utuntur illicitis, vel de illis qui superflue sua in tales consumunt, non de illis histrionibus qui moderate ludo utuntur.*"

Saint Anthony gives his sanction to Saint Thomas on this point: "*Histrionatus ars quia deservit humanæ recreationi quæ necessaria est vitæ hominis secundum D. Thomam, de se non est illicita et de illa arte vivere non est prohibitum.*" (S. Antonius in 3 part. *Suæ Summæ*, tit. iii. cap. 4.) Saint Anthony, indeed, adds the reasonable restriction, that no clergyman should play Harlequin, and that Punch should not exhibit in the church.

Under this venerable authority these *Mimi* went on and flourished. Other characters enlarged their little drama. The personages appeared in masks. "Each of these," says Mr Walker, "was originally intended as a kind of characteristic representation of some particular Italian district or town. Thus *Pantalone* was a Venetian merchant; *Dottore*, a Bolognese physician; *Spaviento*, a Neapolitan braggadocio; *Pullicinella*, a wag of Apulia; *Giangurgolo* and *Coviello*, two clowns of Calabria; *Gelsomino*, a Roman beau; *Beltrame*, a Milanese simpleton; *Brighella*, a Ferarese pimp; and *Arlecchino*, a blundering servant of Bergamo. Each of these personages was clad in a peculiar dress, each had his peculiar mask, and each spoke the dialect of the place he represented. Besides these, and a few other such personages, of which at least four were introduced in each play, there were the *Amorosos* or *Innamoratos;* that is, some men and women who acted serious parts, with Smeraldina, Colombina, Spilletta, and other females, who played the parts of servettas or waiting-maids. All these spoke Tuscan or Roman, and wore no masks." (*Essay on the Revival of the Drama in Italy*, p. 249.)

The pieces acted by this class of actors were called *Commedia dell' arte*, and were congenial to the taste of the Italians, with whom gesticulation and buffoonery are natural attributes. Their drama was of the most simple kind. Each of the actors was already possessed of his dramatic character, which was as inalienable as his dress, and was master of the dialect he was to use, and had his imagination and memory stored with all the characteristic jests, or *lazzi* as they were termed, peculiar to the personage he represented. All that the author had to do was to invent the skeleton of a plot which should bring his characters into dramatic situation with respect to each other. The dialogue suited to the occasion was invented by the players, just as ours invest their parts with the proper gestures and actions. This skeleton had the name of *scenario*, and was filled up by the performers, either impromptu or in consequence of previous arrangement and premeditation. This species of comedy was extremely popular, especially among the lower class of spectators. It was often adopted as an amusement in good society, and by men of genius; and Flamineo de la Scala has left about fifty such *scenarios* adapted for representation. The fashion even found its way into England, and probably the part of Master Punch, who first appeared in the character of the *Vice* of the English morality, was trusted to the improvisatory talents of the actor. Mr d'Israeli, a curious as well as elegant investigator of ancient literature, has shown that at least one scheme of a *Commedia dell' arte* has been preserved to us. It is published in the *Variorum* edition of Shakspeare, but remains unexplained by the commentators. Such comedies, it is evident, could require no higher merit in the composer than the imagining and sketching a few comic situations; the dialogue and diction was all entrusted to the players.

The Italians, however, became early possessed of a regular comedy, which engrossed the admiration of the more cultivated classes of society. Bibbiena's comedy, entitled *La Calandra*, is composed in imitation of Terence and Plautus. It was first acted in 1490. *La Calandra* is remarkable, not only for being the first Italian comedy, but also for the perfection of scenic decoration with which it was accompanied in the representation. It was followed by the productions of Ariosto and Trissino, and other authors in the same line. But it appears, from the efforts used to support this style of drama, that it did not take kindly root in the soil, and lacked that popularity which alone can nurse it freely. Various societies were formed under the whimsical titles of *Gli Intronati*, *Gli Insensati*, and so forth, for the express purpose of bringing forward the regular drama; exertions which would certainly have been unnecessary had it received that support and encouragement which arises from general popularity.

Goldoni, in a later age, at once indulged his own fanciful genius and his natural indolence, by renouncing the classical rules, and endeavouring to throw into the old and native Italian *Mascherata* the variety and attributes of the proper comedy. He adopted Harlequin and the rest of his merry troop in the characters which they held, and endeavoured to enlist them in the more regular service of the drama, just as free corps and partizans are sometimes new-modelled into battalions of the line. This ingenious and lively writer retained all the license of the *Commedia dell' arte*, and all the immunities which it claimed from regular and classical rules; but instead of trusting to the extempore jests and grotesque wit of the persons whom he introduced, he engaged them in dialogues, as well as plots, of his own invention, which often display much humour and even pathos. It required, however, the richness of a fancy like Goldoni's to extract novelty and interest from a dramatic system in which so many of the actors held a fixed and prescriptive character, hardly

Drama.

admitting of being varied. Accordingly, we do not find that the Italian stage is at present in a more flourishing condition than that of other modern nations.

French drama.

The revival of the regular drama in France was attended with important consequences, owing to the nature of her government, the general use of her language throughout Europe, and the influence which, from her situation, she must necessarily hold over other nations. It is the boast of Paris that the regular classical drama, banished from every other stage, found a safe and honourable refuge on her own. Yet France has reluctantly confessed that she also had her hour of barbarism. Her earlier drama was borrowed, like that of other countries, from Spain, who, during the whole of the sixteenth and great part of the seventeenth century, held such a formidable predominance in the European republic. While the classical stage was reviving in Italy, and the historical and romantic drama was flourishing in Spain, France was torn to pieces by civil discord. The first French tragedy composed upon a regular plan was that of *Mairet*, imitated from the *Sophonisba* of Trissino; and Riccoboni boasts with justice, that whoever shall compare the Italian tragedy of the sixteenth century with that of the French of the same period, will find the latter extravagant and irregular, and the former already possessed of gravity, dignity, and regularity. The French, like the English, date the excellence of their stage from one great author; and the illustrious name of Pierre Corneille affords to their dramatic history the mighty landmark which Shakspeare gives to our own.

Cardinal Richelieu, who had succeeded in establishing upon a broad basis the absolute power of the French monarch, was not insensible to the graces and ornaments which the throne derived from being surrounded by the muses. He was himself fond of poetry, and even a competitor for the honours of the buskin. He placed himself at the head of five dramatic writers, to whom on that account the public gave the title of *Les Cinq Auteurs*. All these are deservedly forgotten excepting Corneille, of whose successful talent the cardinal had the meanness to evince no ordinary degree of jealousy. The malevolence of that minister was carried so far that he employed the French Academy, whose complaisance must be recorded to their shame, to criticise severely the *Cid*, the first, and perhaps the finest, of Corneille's tragedies. Scudery, a favourite of the cardinal, buoyed by Richelieu's favour, was able for some time to balance Corneille in the opinion of the public; but his name is now scarcely known by any other circumstance than his imprudent and audacious rivalry. This great man was not only surrounded by the worst possible models, but unfortunately the authors of these models were also favourites of the public and of the all-powerful cardinal; yet Corneille vanquished the taste of his age, the competition of his rivals, and the envy of Richelieu.

Corneille, like his predecessors, and like Routrou in particular, borrowed liberally from the Spanish theatre; but his own taste, regulated probably upon his situation, dictated an adherence to the classical model. The French stage arose, it must be remembered, under the protection of an absolute monarch, for whose amusement the poet laboured, and in whose presence the drama was performed. It followed, as a natural consequence, that a more strict etiquette was exacted upon the scene than had hitherto been supposed applicable to a merely popular amusement. A departure from regularity in tragedy was no longer a bold flight. A violation of decorum in comedy was no longer a broad jest. When the audience was dignified by the presence of the monarch, the former became an impertinence, and the latter a gross and indecent insult. The muse of comedy was therefore bound over for her good behaviour; and even her grave sister was laid under such rules and restrictions as should insure the decorum and dignity of her scene.

French writers enforce the unities.

It was at this period that those classical fetters which are framed on the three unities were fashioned into form, and imposed on the French drama. These are acknowledged by Corneille, in his *Essay upon Dramatic Poetry*, in the following short but emphatic sentence: "*Il faut observer les unités d'action, de lieu, et de jour; personne n'en doute.*" The rule, as thus emphatically admitted by the fiery Corneille, was equally binding upon the elegant Racine, and has fettered the French stage until the present day. "La Motte," says Voltaire, "a man of wit and talent, but attached to paradoxes, has written in our time against the doctrine of the unities; but that literary heresy had no success."

Upon these rules, adopted by the very first writer of eminence for the French stage, and subscribed to by all succeeding dramatists, depends the principal and long-disputed difference betwixt the drama of France and those countries in which her laws of taste have been received, and the stages of Spain, England, and modern Germany, where those critical maxims have been controverted. In other words, the unities proper to the classical drama have been found inapplicable to plays of a historical or romantic plan. It is therefore necessary to examine with accuracy the essence and effect of those laws so often disputed with more obstinacy than liberality.

Examination of this doctrine.

The arbitrary forms to which the French thus subjected their theatre are, in their general purport, founded on good and sound rules of the critical art. But, considered judaically and literally, the interpretation put upon those unities by the French critics must necessarily lay the dramatic author under restraints equally severe and unnecessary, without affording any corresponding addition to the value of his work. The pedantry by which they are enforced reminds one of the extreme, minute, rigorous, and punctilious discipline to which some regiments have been subjected by a pedantic commanding officer, which seldom fails to lower the spirit and destroy the temper of the soldier, without being of the slightest service to him in the moment of danger or the day of battle.

The first dramatic unity is that of action, and, rightly understood, it is by far the most important. A whole, says Aristotle, is that which has a beginning, middle, and end. In short, one strong concentrated interest, upon which all subordinate incidents depend, and to which they contribute, must pervade the piece. It must open with the commencement of the play, evolve itself, and be progressive with its progress—must be perpetually in sight, and never stationary, until at length it arrives at a catastrophe, by which it is ended and extinguished. In this rule, abstractedly considered, there is nothing but what is consistent with good sense and sound criticism. The period allowed for dramatic representation is not long, and will not admit of the episodical ornaments which may be happily introduced into epic poetry. And as the restlessness or impatience of a theatrical audience is always one of its marked characteristics, it has been observed, that neither the most animated description, nor the most beautiful poetry, can ever reconcile the spectators to those inartificial scenes in which the plot or action of the piece stands still that the performers may say fine things. The introduction of an interest, separate and distinct from the main action of the play, has a still worse effect; it diminishes the effect of the whole, and divides the attention of the audience; as a pack of hounds, when in full pursuit, are impeded and puzzled by starting a fresh object of chase.

Yet even this rule must be liberally considered if we would allow dramatic authors that fair room and exercise for their genius, which gives rise to the noblest displays of genius in the art. Modern dramatists are no longer, it must be remembered, limited to the simple and surer uniformity of the ancient drama, which fixed on one single event as its object, made it the subject of the moral reflections of the chorus, managed it by the intervention of three or at most five persons, and consequently presented a picture so limited in size and subject that there was no difficulty in avoiding the intermixture of a foreign interest. The modern taste has opened the stage to a wider range of topics, which are at the same time more complicated in detail, depending on the agency of a variety of performers, and on the result of a succession of events. Such dramas have indeed an unity of action peculiar to themselves, which should predominate over and absorb every other. But although, like the oak, it should predominate over all the neighbouring underwood, its dignity is not injured by the presence and vicinity of that which it overshadows. On the contrary, a succession of events tending to the same end, if they do not divert the attention from the principal interest, cannot fail, by their variety and succession, to keep it fixed upon the business of the scene.

To take an example. In the tragedy of Macbeth a chain of varied and important events are introduced, any one link of which might be hammered out into a drama on the severe and simple model of the drama of ancient Greece. There is the murder of Duncan, that of Banquo, and the dethronement and death of the tyrant; all which are events complete of themselves, independent of each other, and yet included within one tragedy of five acts. But, nevertheless, this is never felt as a deficiency in the performance. It is to the character of Macbeth, to his ambition, guilt, remorse, and final punishment, that the mind attaches itself during the whole play; and thus the succession of various incidents, unconnected excepting by the relation they bear to the principal personage, far from distracting the attention of the audience, continues to sharpen and irritate curiosity till the curtain drops over the fallen tyrant. This is not, indeed, an unity of action according to the rule of Aristotle, or the observance of the French theatre. But, in a lighter point of view, it has all the advantage which could possibly be derived from the severest adherence to the precept of Aristotle, with this additional merit, that the interest never stagnates in declamation, or is suspended by unnecessary dialogue.

It would in fact be easy to show that the unity of action, in its strict sense, may frequently be an unnatural as well as a cumbrous restraint on the genius of the poet. In the course of nature, an insulated action seldom exists of a nature proper to transfer to the stage. If, indeed, the play is founded on some single mythological fable, or if the scene is laid in some early stage of society, when man as yet remained separated from his kind, and connected only with his petty tribe or family, the subject of a plot may be chosen where the agency of a very few persons, and these naturally connected together, may, without foreign or extraneous assistance, afford matter for a tragedy. But in the actual course of the peopled world, men are so crowded together, and their movements depend so much upon impulses foreign to themselves, that the action must often appear multiplied and complicated, and all that the author can do is to preserve the interest uniform and undivided. Its progress may be likened to that of a brook through beautiful scenery. A judicious improver of the landscape would be certainly desirous to make its course visible, but not to cut off its beautiful undulations, or to compel it into a straight channel. He would follow the course of nature, and neither affect to conceal the smaller rills by which the stream was fed, nor bring them so much in view as to deprive the principal object of its consequence. We admit the difficulty inseparable from the dramatic art, and must grant that the author runs some risk of losing sight of the main interest of the piece, by dwelling upon the subordinate accessories; but we contend that the attention of the audience is still more likely to be fatigued by a bald and simple plot, to which, during the course of five acts, there must belong much speaking and little progress. And, in point of common sense and common feeling, that piece must always present unity of action which has unity of interest and feeling; which fixes the mind of the audience upon one train of thought and passion, to which every occurrence in the drama verges; and which is consummated and wound up by the final catastrophe.

The second dramatic unity is that of time, about which the critics of various nations have disagreed. If taken in its strict and proper sense, it means that the time supposed to be consumed in the action represented, should not exceed that which is occupied by the actual representation. But even Aristotle extends the duration of the action to one revolution of the sun, and Corneille extends it to thirty hours, which is to the actual period of representation as ten to one. Boileau, a supereminent authority, thus lays down the rule for the unities of time and place:

> Que le lieu de la scène y soit fixé & marqué.
> Un Rimeur, sans péril, delà les Pirenées,
> Sur la scène en un jour renferme des années.
> Là souvent le Héros d'un spectacle grossier,
> Enfant au premier acte, est Barbon au dernier,
> Mais nous, que la Raison à se règles engage,
> Nous voulons qu'avec art l'action se ménage:
> Qu'en un lieu, qu'en un jour, un seul fait accompli
> Tienne jusqu'à la fin le Théâtre rempli.

It has been triumphantly remarked, that in thus yielding up the strict letter of the precept, in allowing the three hours employed in acting a play to be multiplied into twenty-four or thirty, the critics have retained nearly all the inconvenience of this famous rule, while they sacrificed its principle, and any advantage attached to its observance. The only benefit supposed to be attached to this unity is that of probability. We shall not at present inquire whether this is worth preserving at the cost of imposing heavy restrictions on dramatic genius. But granting the affirmative, probability is as much violated by squeezing the events of twenty-four hours into a period of only three, as if the author had exercised the still greater license of the English and Spanish theatres. There is no charm in the revolution of the sun, which circumscribes within that particular period the events of a drama. When the magic circle drawn around the author by the actual date of representation is once obliterated, the argument grounded upon probability falls; and he may extend his narrative unconfined by any rule, except what may be considered as resolving itself into the unity of action. A week, a month, a year, years may be included in the course of the drama, provided always the poet has power so to rivet the attention of the audience on the passing scene, that the lapse of time shall pass unregarded. There must be none of those marked pauses which force upon the spectators' attention the breach of this unity. Still less ought the judicious dramatist to permit his piece to embrace such a space of time as shall necessarily produce the change on the persons of the characters ridiculed by Boileau. The extravagant conduct of the plot in the *Winter's Tale* has gone far to depreciate that dra-

ma, which, in passages of detached beauty, is inferior to none of Shakspeare's, in the opinion of the best judges. It might perhaps be improved in acting, by performing the three first acts as a play, and the fourth and fifth as an afterpiece. Yet, even as it is now acted, who is it that, notwithstanding the cold objection arising out of the breach of unity, witnesses without delight the exquisite contrast betwixt the court and the hamlet, the fascinating and simple elegance of Perdita, or the witty rogueries of Autolycus? The poet is too powerful for the critic, and we lose the exercise of our judgment in the warmth of our admiration.

The faults of Shakspeare or of his age we do not, however, recommend to the modern dramatist, whose modesty will certainly place him in his own estimation far beneath that powerful magician whose art could fascinate us even by means of deformity itself. But if for his own sake the author ought to avoid such gross violations of dramatic rule, the public, for theirs, ought not to tie him down to such severe limitations as must cramp, at least, if they do not destroy, his power of affording them pleasure. If the whole five acts are to be compressed within the space of twenty-four hours, the events must, in the general case, be either so much crowded upon each other as to destroy the very probability which it is the purpose of this law to preserve; or many of them being supposed to have happened before the commencement of the piece, must be detailed in narrative, which never fails to have a bad effect on the stage.

The same objections apply to the rigid enforcement of the third unity, that of place; and indeed the French authors have used respecting it the license of relaxing, in practice, the severity of their theory. They have frequently infringed the rule which they affirm to be inviolable; and their flexible creed permits the place to be changed, provided the audience are not transported out of the city where the scene is laid. This mitigation of doctrine, like that granted in the unity of time, is a virtual resignation of the principle contended for. Let us examine, however, upon what that principle is founded.

The rule which prohibits the shifting the scene during the period of performance, was borrowed by the French from the ancients, without considering the peculiar circumstances in which it arose. First, we have seen already, that during the ancient drama, there was no division into acts, and that the action was only suspended during the songs of the chorus, who themselves represented a certain class of personages connected with the scene. The stage, therefore, was always filled; and a supposed change of place would have implied the violent improbability that the whole chorus were transported, while in the sight of the spectators, and employed in the discharge of their parts, to the new scene of action. Secondly, there is evidence that in the *Eumenides* of Æschylus, and the *Ajax* of Sophocles, the scene is actually changed, in defiance of the presence of the chorus; and a much greater violation of probability is incurred than could have taken place in a modern theatre, where, before every change of scene, the stage is emptied of the performers. Thirdly, the ancients were less hardly pressed by this rule than the modern writers. From the extent of their theatres and the size of their stages, the place of action was considerably larger, and might be held to include a wider extent, than ours. The climate of Greece admitted of many things being transacted with propriety in the open air; and, finally, they had a contrivance for displaying the interior of a house or temple to the audience, which, if not an actual change of scene, was adapted to the same purpose.

If this long litigated question, therefore, is to be disposed of by precedent, we have shown that the rule of the ancients was neither absolute, nor did the circumstances of their stage correspond with those of ours; to which it may be added, that the simple and inartificial structure of their plots seldom required a change of scene. But surely it is of less consequence to examine the practice of the ancients, than to consider how far it is founded upon truth, good taste, and general effect. Granting, therefore, that the supposed illusion, which transports the spectator to the actual scene of action, really exists, let us inquire whether, in sacrificing the privilege of an occasional change of scene, we do not run the risk of shocking the spectator, and disturbing his delightful dreams, by other absurdities and improbabilities, attendant necessarily on a scrupulous adherence to this restriction.

If the action is always to pass in the scene, some place of general resort must be adopted, a hall, anti-room, or the like. It can seldom be so fortunately selected but that much must be necessarily discussed there, which, in order to preserve any appearance of probability, should be transacted elsewhere; that many persons must be introduced whose presence must appear unnatural; and that much must be done there which the very circumstances of the piece render totally absurd. Dennis has applied these observations with great force, and at the same time with great bitterness, in his critique upon *Cato*, which Johnson has quoted at length in his *Life of Addison*. The scene, it must be remembered, is laid, during the whole drama, with scrupulous attention to the classical rule, in the great hall of Cato's palace at Utica. Here the conspirators lay their plots, the lovers carry on their intrigues; and yet Sempronius, with great inconsistency, disguises himself as Juba to obtain entrance into this vestibule, which was common to all. Here Cato retires to moralize, and chides his son for interrupting him; and although he retires to stab himself, it is to this place that he is brought back to die. All this affords a striking proof how genius and taste can be fettered and embarrassed by a too pedantic observance of rules. Let no one suppose that the inconveniences arising from the rigid observance of the unity of place, occur in the tragedy of *Cato* alone; they might in that case be attributed to the inexperience or want of skill in the author. The tragedies of Corneille and Racine afford examples enough that the authors found themselves compelled to violate the rules of probability and common sense, in order to adhere to those of Aristotle. In the tragedy of *Cinna*, for example, the scene is laid in the emperor's cabinet; and in that very cabinet, compelled, doubtless, by the laws of unity, Amelia shouts forth aloud her resolution to assassinate the emperor. It is there too that Maximus and Cinna confide to each other all the secrets of their conspiracy; and it is there where, to render the impropriety more glaring, Cinna suddenly reflects upon the rashness of his own conduct:

> Amis, dans ce palais on peut nous écouter;
> Et nous parlons peut-être avec trop d'imprudence,
> Dans un lieu si mal propre à notre confidence.

It would be an invidious, but no difficult task, to show that several of the *chefs d'œuvres* of the French drama are liable to similar objections; and that the awkward dilemmas in which the unity of place involves them, is far more likely to destroy the illusion of the performance, than the mere change of scene would have done. But we refer the reader to the *Dramaturgie* of Lessing upon this curious topic.

The main question yet remains behind, namely, whether such an illusion is actually produced in the minds of the audience by the best-acted play, as induces them to

suppose themselves witnessing a reality;—an illusion, in short, so complete, as to suffer from the occasional extension of time or change of place in the course of the piece? We do not hesitate to say that no such impression was ever produced on a sane understanding; and that the Parisian critic, in whose presence the unities are never violated, no more mistakes Talma for Nero, than a London citizen identifies Kemble with Coriolanus, or Kean with Richard III.[1] The ancients, from the distance of the stage, and their mode of dressing and disguising their characters, might certainly approach a step nearer to reality; and producing on their stage the very images of the deities they worshipped, speaking the language which they accounted proper to them, it is highly probable that, to minds capable of high excitation, there might be a shade of this illusion in their representations. The solemn distance of the stage, the continuous and uninterrupted action, kept the attention of the Greeks at once more closely riveted, and more abstracted from surrounding circumstances. But in the modern theatre, the rapid succession of intervals for reflection, the well-known features of the actors, the language which they speak differing frequently from that which belongs to the age and country where the scene is laid, interrupt at every turn every approximation to the fantastic vision of reality into which those writers who insist upon the strict observance of the unities suppose the audience to be lulled. To use the nervous words of Johnson, "It is false that any representation is mistaken for reality; that any dramatic fable in its materiality was ever credible, or for a single moment was ever credited." There is a conventional treaty between the author and the audience, that upon certain suppositions being granted by the latter, his powers of imagination shall be exerted for the amusement of the spectators. The postulates which are demanded, even upon the French theatre, and under the strictest model, are of no ordinary magnitude. Although the stage is lighted with lamps, the spectator must say with the subjugated Catherine,

I grant it is the sun that shines so bright.

The painted canvass must pass for a landscape; the well-known faces of the performers for those of ancient Greeks, or Romans, or Saracens; and the present time for many ages distant. He that submits to such a convention ought not scrupulously to limit his own enjoyment; that which is supposed Rome in one act, may in the next be fancied Paris; and as for time, it is, to use the words of Dr Johnson, "of all modes of existence, most obsequious to imagination; a lapse of years is as easily conceived as a passage of hours. In contemplation we easily contract the time of real actions, and therefore willingly permit it to be contracted when we only see their imitation."

If dramatic representation does not produce the impression of reality, in what, it may be asked, consists its power? We reply, that its effects are produced by the powerful emotions which it excites in the minds of the spectators. The professors of every fine art operate their impressions in the same manner, though they address themselves to different organs. The painter exhibits his scene to the eye, the orator pours his thunder upon the ear, the poet awakens the imagination of his reader by written description; but each has the same motive, the hope, namely, of exciting in the reader, hearer, or spectator, a tone of feeling similar to that which existed in his own bosom, ere it was bodied forth by his pencil, tongue, or pen. It is the artist's object, in short, to tune the reader's imagination to the same pitch with his own; and to communicate, as well as colours and words can do, the same sublime sensations which had dictated his own compositions. The tragedian attempts to attain this object still more forcibly, because his art combines those of the poet, orator, and artist, by storming as it were the imagination at once through the eye and the ear. Undoubtedly a drama with such advantages, and with those of dresses and costume, approaches more nearly to actual reality, and therefore has a better chance of attaining its object, especially when addressing the sluggish and inert fancies of the multitude; although it may remain a doubtful question whether, with all these means and appliances, minds of a high poetic temperature may not receive a more lively impression from the solitary perusal than from the representation of one of Shakspeare's plays. But, to the most ignorant spectator, however unaccustomed to the trick of the scene, the excitement which his fancy receives falls materially short of actual mental delusion. Even the sapient Partridge himself never thought of being startled at the apparition of the king of Denmark, which he knew to be only a man in a strange dress; it was the terror so admirably expressed by Garrick, which communicated itself to his feelings, and made him reverse the case of the fiends, and tremble without believing. In truth, the effects produced upon this imaginary character, as described by an excellent judge of human nature, exhibit, probably, the highest point of illusion to which theatrical exhibition can conduct a rational being. In an agony of terror which made his knees knock against each other, he never forgets that he is only witnessing a play The presence of Mrs Millar and his master assures him against the reality of the apparition; yet he is no more able to subdue his terrors by this comfortable reflection, than we have been to check our tears, although well aware that the Belvidera with whose sorrows we sympathized was no other than our own inimitable Mrs Siddons. With all our passions and all our sympathies, we are still conscious of the ideal character of that which excites them; and it is probably this very consciousness of the unreality of scene that refines our sorrows into a melancholy yet delicious emotion, and extracts from it that bitterness necessarily connected with a display of similar misery in actual life.

If, therefore, no illusion subsists of a character to be affected by a change of scene, or by the prolongation of the time beyond the rules of Aristotle, the very foundation of these unities is undermined; but, at the same time, every judicious author will use liberty with prudence.

If we are inclined to ascend to the origin of these celebrated rules, we ought not to be satisfied with the *ipse dixit* of a Grecian critic, who wrote so many centuries ago, and whose works have reference to a state of dramatic composition which has now no existence. Upon the revival of letters, indeed, the authority of Aristotle was considered as omnipotent; but even Boileau remonstrated against his authority, when weighed with that of reason and common sense.

Un pedant envieux de sa vaine science,
Tout herissé de Grec, tout bouffi d'arrogance,
Et qui de mille auteurs retenus mot pour mot,
Dans la teste entassez, n'a souvent fait qu'un sot,
Croit qu'un livre fait tout, et que sans Aristote
La raison ne voit goutte, et le bon sens radote.

The opinions of Aristotle must be judged of according to the opportunities and authorities which lay open before him; and from the high critical judgment he has displayed, we can scarce err in supposing he would have drawn

Drama.

different results in different circumstances. Dr Drake, whose industry and taste have concentrated so much curious information respecting Shakspeare and his age, has quoted upon this topic a striking passage from Mr Morgan's *Essay on the Character of Falstaff*.

Speaking, says Dr Drake, of the magic influence which our poet almost invariably exerts over his auditors, Mr Morgan remarks, that "on such an occasion, a fellow like *Rymer*,[1] waking from his trance, shall lift up his constable's staff, and charge this great magician, this daring *practiser of arts inhibited*, in the name of Aristotle to surrender; whilst Aristotle himself, disowning his wretched officer, would fall prostrate at his feet and acknowledge his supremacy.—O supreme of dramatic excellence! might he say, not to me be imputed the insolence of fools. The bards of *Greece* were confined within the narrow circle of the chorus, and hence they found themselves constrained to practise, for the most part, the precision, and copy the details, of nature. I followed them, and knew not that a larger circle might be drawn, and the drama extended to the whole reach of human genius. Convinced, I see that a more compendious *nature* may be obtained; a nature of *effects* only, to which neither the relation of places, or continuity of time, are always essential. Nature, condescending to the faculties and apprehensions of man, has drawn through human life a regular chain of visible causes and effects. But poetry delights in surprise, conceals her steps, seizes at once upon the heart, and obtains the sublime of things without betraying the rounds of her ascent. True poetry is *magic*, not *nature;* an effect from causes hidden or unknown. To the magician I prescribed no laws; his law and his power are one; his power is his law. If his end is obtained, who shall question his course? Means, whether apparent or hidden, are justified in poesy by success; but then most perfect and most admirable when most concealed.

"Yes, continues Mr Morgan, whatever may be the neglect of some, or the censure of others, there are those who firmly believe that this wild, this uncultivated *barbarian*, as he has been called, has not yet obtained one half of his fame; and who trust that some new Stagyrite will arise, who, instead of pecking at the surface of things, will enter into the inward soul of his compositions, and expel, by the force of congenial feelings, those foreign impurities which have stained and disgraced his page. And as to those *spots* which still remain, they may perhaps become invisible to those who shall seek them through the medium of his beauties, instead of looking for those beauties, as is too frequently done, through the smoke of some real or imputed obscurity. When the hand of time shall have brushed off his present editors and commentators, and when the very name of Voltaire, and even the memory of the language in which he has written, shall be no more, the Appalachian Mountains, the banks of the Ohio, and the plains of Sciola, shall resound with the accents of this *barbarian*. In his native tongue he shall roll the genuine passions of nature; nor shall the griefs of *Lear* be alleviated, or the charms and wit of *Rosalind* be abated, by *time*."[2]

In adopting the views of those authors who have pleaded for the liberty of the poet, it is not our intention to deny that great advantages may be obtained by the observance of the unities; not considering them as in themselves essential to the play, but only as points upon which the credibility and intelligibility of the action in some sort depends. We acknowledge, for example, that the author would be deficient in dramatic art, who should divide the interest of his piece into two or more separate plots, instead of combining it in one progressive action. We confess, moreover, that the author, who more violently extends the time, or more frequently changes the place of representation, than can be justified by the necessity of the story, and vindicated by his exertion of dramatic force, acts unwisely, in so far as he is likely to embarrass a great part of the audience, who, from imperfect hearing or slowness of comprehension, may find it difficult to apprehend the plot of his play. The latitude which we are disposed to grant is regulated by the circumstances of the case, the interest of the plot, and, above all, the talents of the author. He that despises the praise of regularity which is attainable by study, cannot reckon on the indulgence of the audience, unless on the condition of indemnifying them by force of genius. If a definitive rule were to be adopted, we should say that it would certainly be judicious to place any change of place or extension of time at the beginning of a new act; as the falling of the curtain and cessation of the action has prepared the audience to set off, as it were, upon a new score. But we consider the whole of these points of propriety as secondary to the real purposes of the drama, and not as limitary of that gifted genius who can, in the whirlwind of his scene, bear the imagination of his audience along with him over the boundaries of place,

While panting time toils after them in vain.

French notions of tragi-comedy.

It is not upon the observance of the unities alone that the French found their pretensions to a classical theatre. They boast also to have discarded that intermixture of tragic and comic scenes, which was anciently universal upon the Spanish and English stages.

If it had been only understood by this reformation, that the French condemned and renounced that species of tragi-comedy which comprehended two distinct plots, the one of a serious, the other of a humorous character, and these two totally unconnected, we give them full credit for their restriction. Dryden, in the *Spanish Friar*, and other pieces; and Southern, both in *Oronoko* and *Isabella*, as well as many other authors of their age, have in this particular transgressed unpardonably the unity of action. For, in the cases we have quoted, the combination of the two plots is so slight, that the serious and comic scenes separated, might each furnish forth a separate drama; so that the audience appear to be listening, not to one play only, but to two dramatic actions independent of each other, although contained in the same piece. So far, therefore, we heartily agree in the rule which excludes such an unhappy interchange of inconsistent scenes, moving upon opposite principles and interests.

When, however, the French critics carry this rule farther, and proscribe the appearance of comic or inferior characters, however intimately connected with the tragic plot, we would observe, in the first place, that they run the risk of diminishing the reality of the scene; and secondly, that they exclude a class of circumstances essential to its beauty.

On the first point it must be observed, that the rule which imposes upon valets and subordinate personages the necessity of talking as harmonious verse and as elegant poetry as their masters, entirely ruins the probability of the action. Where all is elegant, nothing can be sublime; where all is ornamented, nothing can be impressive; where all is tuned to the same smooth *falsetto* of sentiment, nothing can be natural or real. By such an assimilation of manners and language, we stamp fiction on the very front

[1] Rymer was a calumniator of Shakspeare.
[2] *Shakspeare and his Times*, by Nathan Drake, M.D. p. 553, 554, vol. ii.

of our dramatic representation. The touches of nature which Shakspeare has exhibited in his lower and gayer characters, like the chastened back-ground of a landscape, increase the effect of the principal group. The light and fanciful humour of Mercutio serves, for example, to enhance and illustrate the romantic and passionate character of Romeo. Even the doating fondness and silly peevishness of the nurse tends to relieve the soft and affectionate character of Juliet, and to place her before the audience in a point of view which those who have seen Miss O'Neil perform Juliet know how to appreciate. A contrast is effected which a French author dared not attempt, but of which every bosom at once acknowledges the power and the truth. Let us suppose that the gay and gallant Mercutio had as little character as the walking confident of a French hero, who echoes the hexameters of his friend in hexameters of a lower level; or let us suppose the nurse of Juliet to be a gentle Nora, as sublime in white linen as her principal in white satin; and let the reader judge whether the piece would gain in dignity any thing proportioned to what it must lose in truth and interest. The audience at once sympathizes with the friendship of Romeo and Mercutio, rendered more natural and more interesting by the very contrast of their characters; and each spectator feels as a passion, not as a matter of reflection, that desire of vengeance which impels Romeo against Tibalt; for we acknowledge as an amiable and interesting individual the friend whom he has lost by the sword of Capulet. Even the anilities of the nurse give a reality to the piece, which, whatever French critics may pretend, is much more seriously disturbed by inconsistency of manners, than by breach of their dramatic unities. "God forbid," says Mr Puff, in the *Critic*, "that, in a free country, all the fine words in the language should be engrossed by the higher characters of the piece." The French critics did not carry their ideas of equality quite so far, but they tuned the notes of their subalterns just one pitch lower than those of their principal characters, so that their language, similar in style, but lower in sentiment and diction, presents still that subordinate resemblance and correspondence to that of their superiors, which the worsted lace upon the livery of a servant bears to the embroidery upon the coat of his master.

It is not to mere expression that these remarks are confined; for if we consult the course of human life, we shall find that mirth and sorrow, and events which cause both, are more nearly allied than perhaps it is altogether pleasing to allow. Considered relatively to a spectator, an incident may often excite a mingled emotion, partaking at once of that which is moving and that which is ludicrous; and there is no reader who has not, at some period of his life, met with events at which he hesitated whether to laugh or to cry. It remains to be proved why scenes of this dubious yet interesting description should be excluded from the legitimate drama, while their force is acknowledged in that of human life. We acknowledge the difficulty of bringing them upon the scene with their full and corresponding effect. It was perhaps under this persuasion that the fool, whose wild jests were too much the result of habit and practice to be subdued even by the terrors of the storm, has been banished from the terrific scene of King Lear. But, in yielding to this difficulty, the terrible contrast has been thus destroyed, in which Shakspeare exhibited the half perceptions of the natural fool, as contrasted with the assumed insanity of Edgar, and the real madness of the old king. They who prefer to this living variety of emotion the cold uniformity of a French scene of passion, must be numbered among those who read for the pleasure of criticism, and without hope of partaking the enthusiasm of the poet.

While we differ from French criticism respecting the right to demand an accurate compliance with the unities, and decline to censure that casual intermixture of comic character which gives at once reality and variety to the drama, we are no less disposed to condemn the impertinent love scenes which these authors have, as a matter of etiquette, introduced into all their tragedies, however alien from the passion on which they are grounded. The French drama assumed its present form under the auspices of Louis XIV. who aimed at combining all the characters of a hero of romance. The same spirit which inspired the dull monotony of the endless *folios* of Scudery and Calprenede, seemed to dictate to Corneille, and even to Racine, those scenes of frigid metaphysical passion which encumber their best plays. We do not dispute the deep interest which attaches to the passion of love, so congenial to the human breast, when it forms the groundwork of the play; but it is intolerably nauseous to find a dull love tale mingled as a indispensable ingredient in every dramatic plot, however inconsistent with the rest of the piece. The *Amoureux* and *Amoureuse* of the piece come regularly forth to recite their common-places of gallantry, in language as cold as it is exaggerated, and as inconsistent with passion and feeling as with propriety and common sense. Even the horrid tale of Œdipus has the misplaced garnishment of a love intrigue between Theseus, brought there for no other purpose, and a certain Dirce, whom, in the midst of the pestilence, he thus gallantly compliments:

> Quelque ravage affreux qu'étale ici la peste,
> L'absence aux vrais amans est encore plus funeste.

The predominance of a passion which expresses itself so absurdly is all that the French have condescended to adopt from the age of chivalry, so rich in more dramatic stores; and they have borrowed it in all its pedantry, and without its tenderness and fire. Riccoboni has probably alleged the true reason for the introduction of these heavy scenes of love intrigue, which is, that at little expense of labour to the author, they fill up three quarters of the action of his play. We quote from the French version, as that immediately before us, and most generally intelligible: "*Par exemple, ôtons de* NICOMEDE *les dix scènes de* LAODICE, *de l'*ŒDIPE *les dix scènes de* DIRCE, *de* POLIEUCTE *les scènes d'amour de* SEVERE, *de la* PHEDRE *de Monsieur Racine les six scènes d'*ARICIE, *et nous verrons que non seulement l'action ne sera point interrompuë, mais qu'elle en sera plus vive; en sorte que l'on verra manifestement, que ces scènes de tendresses n'ont servi qu'à ralentir l'action de la pièce, à la refroidir, et à rendre le héros moins grand. Si après ces deux meilleurs tragédies de la France, on examine tous les autres, on connoitra bien mieux cette vérité. Lorsque l'amour fait le sujet de la tragédie, ce sentiment, si intéressant par lui-même, occupe le scène avec raison; j'aime l'amour de* PHEDRE, *mais de* PHEDRE *seule*." Under this thraldom the fetters of the French stage long laboured, notwithstanding the noble example of *Athalie*, the chef d'œuvre of Racine. By the example of Voltaire, in one or two of his best pieces, they have of late ventured occasionally to discard their uninteresting Cupid, whose appearance on the stage as a matter of course and of ceremony, produced as little effect as when his altar and godhead are depicted on the semicircle of a fan.

We have already observed, that the refined, artificial, and affected character of the French tragedy, arose from its immediate connection with the pleasures and with the presence of an absolute sovereign. From the same circumstance, however, the French stage derived several advantages. A degree of discipline, unknown in other theatres, was early introduced among the French actors; and those of a subordinate rank, who, on the English stage,

Drama. sometimes exhibit intolerable, contemptuous, and wilful negligence, become compelled, on that of France, to pay the same attention to their parts as their superiors, and to exert what limited talents they possess in the subordinate parts to which they are adapted. The effect of this common diligence upon the scene, is a general harmony and correspondence in its parts, which never fails to strike a stranger with admiration.

The royal protection, also, early produced on the Parisian stage an improved and splendid style of scenery, decoration, and accompaniments. The scenes and machinery which they borrowed from Italy, they improved with their usual alert ingenuity. They were still further improved under the auspices of Voltaire, who had the sole merit of introducing natural and correct costume. Before his time the actors, whether Romans or Scythians, appeared in the full dress of the French court; and Augustus himself was represented in a huge full-bottomed wig, surmounted by a crown of laurel. The strict national costume introduced by Voltaire is now observed. That author has also the merit of excluding the idle crowd of courtiers and men of fashion who thronged the stage during the time of representation, and formed a sort of semicircle round the actors, leaving them thus but a few yards of an area free for performance, and disconcerting at once the performers and the audience, by the whimsical intermixture of players and spectators. The nerves of those pedants who contended most strenuously for the illusion of the scene, and who objected against its being interrupted by an occasional breach of the dramatic unities, do not appear to have suffered from the presence of this singular chorus.

Corneille. It was not decoration and splendour alone which the French stage owed to Louis XIV. Its principal obligation was for that patronage which called forth in its service the talents of Corneille and Racine, the Homer and the Virgil of the French drama. However constrained by pedantic rules; however held back from using that infinite variety of materials which national and individual character presented to them; however frequently compelled by system to adopt a pompous, solemn, and declamatory style of dialogue; these distinguished authors still remain the proudest boast of the classical age of France, and a high honour to the European republic of letters. It seems probable that Corneille, if left to the exercise of his own judgment, would have approximated more to the romantic drama. The *Cid* possesses many of the charms of that species of composition. In the character of Don Gourmaz, he has drawn a national portrait of the Spanish nobility, for which very excellence he was subjected to the censure of the academy, his national court of criticism. In a general point of view, he seems to have been ambitious of overawing his audience by a display of the proud, the severe, the ambitious, and the terrible. Tyrants and conquerors have never sat to a painter of greater skill; and the romantic tone of feeling which he adopts in his more perfect characters is allied to that of chivalry. But Corneille was deficient in tenderness, in dramatic art, and in the power of moving the passions. His fame, too, was injured by the multiplicity of his efforts to extend it. Critics of his own nation have numbered about twenty of his dramas which have little to recommend them; and no foreign reader is very likely to verify or refute the censure, since he must previously read them to an end.

Racine, who began to write when the classical fetters were clenched and riveted upon the French drama, did not make that effort of struggling with his chains which we observe in the elder dramatist; he was strong where Corneille evinced weakness, and weak in the points where his predecessor showed vigour. Racine delineated the passion of love with truth, softness, and fidelity; and his Drama. scenes of this sort form the strongest possible contrast with those in which he, as well as Corneille, sacrificed to the dull Cupid of metaphysical romance. In refinement and harmony of versification, Racine has hitherto been unequalled; and his *Athalie* is, perhaps, likely to be generally acknowledged as the most finished production of the French drama.

Voltaire. Subsequent dramatists, down to the time of Voltaire, were contented with imitating the works of these two great models, until the active and ingenious spirit of that celebrated author seems tacitly to have meditated further experimental alterations than he thought it prudent to defend or to avow. His extreme vivacity and acute intellect were mingled, as is not unfrequent in such temperaments, with a certain nervous timidity, which prevented him from attempting open and bold innovation, even where he felt compliance with existing rules most inconvenient and dispiriting. He borrowed, therefore, liberally from Shakspeare, whose irregularities were the frequent object of his ridicule; and he did not hesitate tacitly to infringe the dramatic unities in his plays, while in his criticism he holds them up as altogether inviolable. While he altered the costume of the stage, and brought it nearer to that of national truth, he made one or two irresolute steps towards the introduction of national character. If we were, indeed, to believe the admirers of Corneille, little remained to be done in this department; he had already, it is said, taught his Romans to speak as Romans, and his Greeks as Greeks; but of such national discrimination foreigners are unable to perceive a trace. His heroes, one and all, talk like men of no peculiar character or distinct age and nation, but, like the other heroes of the French dramatic school, are "all honourable men," who speak in high, grave, buskined rhimes, where an artificial brilliancy of language, richness of metaphor, and grandeur of sentiment, are substituted for that concise and energetic tone of dialogue, which shows at once the national and individual character of the personage who uses it. In *Mahomet*, *Alzire*, and one or two other pieces, Voltaire has attempted some discrimination of national character; the groundwork, however, is still French; and, under every disguise, whether of the turban of the Ottoman, the feathery crown of the savage, or the silk tunic of the Chinese, the character of that singular people can be easily recognized. Voltaire probably saw the deficiency of the national drama with his usual acuteness; but, like the ancient philosophers, he contentedly joined in the idolatry which he despised.

It seems, indeed, extremely doubtful whether the French tragedy can ever be brought many steps nearer to nature. That nation is so unfortunate as to have no poetical language; so that some degree of unnatural exaltation of sentiment is almost necessary to sustain the tone of tragedy at a pitch higher than that of ordinary life. The people are passionately fond of ridicule; their authors are equally afraid of incurring it: they are aware, like their late ruler, that there is but one step betwixt the sublime and the ridiculous; and they are afraid to aim at the former, lest their attempt, falling short, should expose them to derision. They cannot reckon on the mercy or enthusiasm of their audience; and while they banish combats and deaths, and even violent action of any kind, from the stage, this seems chiefly on account of the manifest risk that a people, more alive to the ludicrous than the lofty, might laugh when they should applaud. The drunken and dizzy fury with which Richard, as personated by Kean, continues to make the motion of striking after he has lost his weapon, would be caviare to the Parisian parterre. Men must compound with their poets and actors,

and pardon something like extravagance, on the score of enthusiasm. But if they are nationally dead to that enthusiasm, they resemble a deaf man listening to eloquence, who is more likely to be moved to laughter by the gestures of the orator, than to catch fire at his passionate declamation.

Above all, the French people are wedded to their own opinions. Each Parisian is, or supposes himself, master of the rules of the critical art; and whatever limitations it imposes on the author, the spectators receive some indemnification from the pleasure of sitting in judgment upon him. To require from a dancer to exhibit his agility without touching any of the lines of a diagram chalked on the floor, would deprive the performance of much ease, strength, and grace; but still the spectator would feel a certain interest in watching the dexterity with which the artist avoided treading on the interdicted limits, and a certain pride in detecting occasional infringements. In the same manner, the French critic obtains a triumph from watching the transgressions of the dramatic poet against the laws of Aristotle; equal, perhaps, to the more legitimate pleasure he might have derived from the unfettered exercise of his talents. Upon the whole, the French tragedy, though its regulations seem to us founded in pedantry, and its sentiments to belong to a state of false and artificial refinement, contains, nevertheless, passages of such perfect poetry and exquisite moral beauty, that to hear them declaimed with the art of Talma, cannot but afford a very high pitch of intellectual gratification.

French comedy.

The French comedy assumed a regular shape about the same period with the tragedy; and Molière was in his department what Corneille and Racine were in theirs; an original author, approached in excellence by none of those that succeeded him. The form which he assumed for a model was that of the comedy of Menander, and he has copied pretty closely some pieces from the Latin stage. Molière was endowed by nature with a rich fund of comic humour, which is nowhere more apparent than in those light pieces which are written upon the plan of the Italian masked comedy. In these he has introduced the jealous old pantaloon, the knavish and mischievous servant, and some of its other characters. In his regular comedy he soared to a higher pitch. Before his time the art had sought its resources in the multiplicity and bustle of intrigue, escape, and disguise,—of, at best, in a comic dialogue, approaching to mere buffoonery. Molière's satire aimed at a nobler prey; he studied mankind for the purpose of attacking those follies of social life which are best exposed by ridicule. The aim of few satirists has been so legitimate, or pursued with such success. Female vanity, learned pedantry, unreasonable jealousy, the doating and disgraceful passions of old men, avarice, coquetry, slander, the quacks who disgrace medicine, and the knaves who prostitute the profession of the law, were the marks at which his shafts were directed.

Molière's more regular comedies are limited by the law of unities, and finished with great diligence. It is true, the author found it sometimes necessary tacitly to elude the unity of place, which he durst not openly violate; but, in general, he sacrifices probability to system. In the *Ecole des Femmes*, Arnolph brings his wife into the street, out of the room in which his jealousy has imprisoned her, in order to lecture her upon the circumspection due to her character; which absurdity he is guilty of, that the scene may not be shifted from the open space before his door to her apartment. In general, however, it may be noticed, that the critical unities impose much less hardship upon the comic than upon the tragic poet. It is much more easy to reconcile the incidents of private life to the unities of time and place, than to compress within their limits the extensive and prolonged transactions which comprehend the revolution of kingdoms and fate of monarchs. What influence, however, these rules do possess, must operate to cramp and embarrass the comic as well as the tragic writer; to violate and disunite those very probabilities which they affect to maintain; and to occasion a thousand real absurdities rather than grant a conventional license, which seems essential to the freedom of the drama.

The later comic authors of France seem to have abandoned the track pointed out by Molière, as if in despair of approaching his excellence. Their comedy, compared with that of other nations, and of their great predecessor, is cramped, and tame, and limited. In this department, as in tragedy, the stage experienced the inconvenience arising from the influence of the court. The varied and unbounded field of comic humour which the passions and peculiarities of the lower orders present, was prohibited, as containing subjects of exhibition too low and vulgar for a monarch and his courtiers; and thus the natural, fresh, and varied character of comedy was flung aside, while the heartless vices and polished follies of the great world were substituted in its place. Schlegel has well observed, that the object of French comedy "is no longer life, but society; that perpetual negotiation between conflicting vanities which never ends in a sincere treaty of peace; the embroidered dress, the hat under the arm, and the sword by the side, essentially belong to them; and the whole of the characterization is limited to the folly of the men and the coquetry of the women."

It is scarcely in nature that a laughter-loving people should have remained satisfied with an amusement so dull and insipid as their regular comedy. A few years preceding the revolution, and while the causes of that event were in full fermentation, the *Marriage of Figaro* appeared on the stage. It is a comedy of intrigue; and the dialogue is blended with traits of general and political satire, as well as with a tone of licentiousness, which was till then a stranger to the French stage. It was received with a degree of enthusiastic and frantic popularity which nothing but its novelty could have occasioned, for there is little real merit in the composition. Frederick of Prussia, and other admirers of the old theatrical school, were greatly scandalized at so daring an innovation on the regular French comedy. The circumstances which followed have prevented Beaumarchais' example from being imitated; and the laughers have consoled themselves with inferior departments of the drama. Accordingly, we find the blank supplied by farces, comic operas, and dramatic varieties, in which plots of a light, flimsy, and grotesque character are borne out by the comic humour of the author and comic skill of the actor. Brunet, a comedian of extraordinary powers in this cast of interludes, has at times presumed so far upon his popularity as to season his farce with political allusions. It will scarce be believed that he aimed several shafts at Napoleon when in the height of his power. The boldness as well as the wit of the actor secured him the applause of the audience; and such a hold had Brunet of their affections, that an imprisonment of a few hours was the greatest punishment which Bonaparte ventured to inflict upon him. But whatever be the attachment shown to the art in general, the French, like ourselves, rest the character of their theatre chiefly upon the ancient specimens of art; and the regular tragedy, as well as comedy, seems declining in that kingdom.

English drama.

As the drama of France was formed under the patronage of the monarch, and bears the strongest proofs of its courtly origin, that of England, which was encouraged by the people at large, retains equally unequivocal marks of its popular descent. Its history must naturally draw to

some length, as being that part of our article likely to be most interesting to the reader. In part, however, we have paved the way for it by the details common to the rise of dramatic art in the other nations of Europe. We shall distinguish the English drama as divided into four periods, premising that this is merely a general, and not a precise division. The taste which governed each period, and the examples on which it is grounded, will usually be found to have dawned in the period preceding that in which it was received and established.

I. From the revival of the theatre until the great civil war.

II. From the Restoration to the reign of Queen Anne.

III. From the earlier part of the last century down to the present reign.

IV. The present state of the British drama.

First period of the English drama.

I. The drama of England commenced, as we have already observed, upon the Spanish model. *Ferrex and Perrex* was the first composition approaching to a regular tragedy, and it was acted before Queen Elizabeth, upon the 18th day of January 1561, by the gentlemen of the Inner Temple. It partakes rather of the character of a historical than of a classical drama, although more nearly allied to the latter class than the chronicle plays which afterwards took possession of the stage. We have already recorded Sir Philip Sidney's commendation of this play, which he calls by the name of *Gorboduc*, from one of the principal characters. Acted by a learned body, and written in great part by Lord Sackville, the principal author of the *Mirror for Magistrates*, the first of English tragedies assumed in some degree the honours of the learned buskin; but although a chorus was presented according to the classical model, the play was free from the observance of the unities, and contains many irregularities severely condemned by the regular critics.

English comedy, considered as a regular composition, is said to have commenced with *Gammer Gurton's Needle*. This " right pithy, pleasant, and merry comedy," was the supposed composition of John Still, Master of Arts, and afterwards Bishop of Bath and Wells. It was acted in Christ-Church College, Cambridge, in 1575. It is a piece of low humour, the whole jest turning upon the loss and recovery of the needle with which Gammer Gurton was to repair the breeches of her man Hodge; but, in point of manners, it is a great curiosity, as the *curta suppellex* of our ancestors is scarcely anywhere so well described. The popular characters also, the Sturdy Beggar, the Clown, the Country Vicar, and the Shrew of the sixteenth century, are drawn in colours taken from the life. The unity of time, place, and action, are observed through the play with an accuracy of which France might be jealous. The time is a few hours; the place, the open square of the village before Gammer Gurton's door; the action, the loss of the needle; and this, followed by the search for and final recovery of that necessary implement, is intermixed with no other thwarting or subordinate interest, but is progressive from the commencement to the conclusion.

It is remarkable that the earliest English tragedy and comedy are both works of considerable merit; that each partakes of the distinctive character of its class; that the tragedy is without intermixture of comedy, the comedy without any intermixture of tragedy.

These models were followed by a variety of others, in which no such distinctions were observed. Numerous theatres sprung up in different parts of the metropolis, opened upon speculation by distinct troops of performers. Their number shows how much they interested public curiosity; for men never struggle for a share in a losing profession. They acted under licenses, which appear to have been granted for the purpose of police alone, not of exclusive privilege or monopoly; since London contained, in the latter part of the sixteenth century, no fewer than fourteen distinct companies of players, with very considerable privileges and remunerations. (See Drake's *Shakspeare and his Times*, vol. ii. p. 205.)

The public, therefore, in the widest sense of the word, was at once arbiter and patron of the drama. The companies of players who traversed the country might indeed assume the name of some peer or baron, for the sake of introduction or protection; but those of the metropolis do not, at this early period of our dramatic history, appear to have rested in any considerable degree upon learned or aristocratic privilege. Their license was obtained from the crown, but their success depended upon the voice of the people; and the pieces which they brought forward were, of course, adapted to popular taste. It followed necessarily that histories and romantic dramas were the favourites of the age. A general audience in an unlearned age requires rather amusement than conformity to rules, and is more displeased with a tiresome uniformity than shocked with the breach of all the unities. The players and dramatists, before the rise of Shakspeare, followed, of consequence, the taste of the public, and dealt in the surprising, elevating, and often bombastic incidents of tragedy, as well as in the low humour and grotesque incident of the comic scene. Where these singly were found to lack attraction, they mingled them together, and dashed their tragic plot with an under-intrigue of the lowest buffoonery, without any respect to taste or congruity.

The clown was no stranger to the stage; he interfered, without ceremony, in the most heart-rending scenes, to the scandal of the more learned spectators.

> Now lest such frightful shows of fortune's fall,
> And bloody tyrant's rage, should chance appall
> The death-struck audience, 'midst the silent rout
> Comes leaping in a self-misformed lout,
> And laughs and grins, and frames his mimic face,
> And jostles straight into the prince's place;
> Then doth the theatre echo all aloud
> With gladsome noise of that applauding crowd,
> A goodly hotchpotch, where vile russettings
> Are matched with monarchs and with mighty kings.

An ancient stage-trick, illustrative of the mixture of tragic and comic action in Shakspeare's time, was long preserved in the theatre. Henry IV. holding council before the battle of Shrewsbury, was always represented as seated on a drum; and when he rose and came forward, the place was occupied by Falstaff, which seldom failed to produce a laugh from the galleries. The taste and judgment of the author himself was very different. During the whole scene Falstaff gives only once, and under irresistible temptation, the rein to his petulant wit, and it is instantly checked by the prince, to whom, by the way, and not to the king, his words ought to be addressed.

Shakspeare.

The English stage might be considered as equally without rule and without model when Shakspeare arose. The effect of the genius of an individual upon the taste of a nation is mighty; but that genius, in its turn, is formed according to the opinions prevalent at the period when it comes into existence. Such was the case with Shakspeare. With an education more extensive, and a taste refined by the classical models, it is probable that he also, in admiration of the ancient drama, might have mistaken the form for the essence, and subscribed to those rules which had produced such masterpieces of art. Fortunately for the full exertion of a genius as comprehensive and versatile as intense and powerful, Shakspeare had no access to any models of which the commanding merit might have controlled and limited his own exertions. He followed the

path which a nameless crowd of obscure writers had trodden before him; but he moved in it with the grace and majestic step of a being of a superior order, and vindicated for ever the British theatre from a pedantic restriction to classical rule. Nothing went before Shakspeare which in any respect was fit to fix and stamp the character of a national drama; and certainly no one will succeed him capable of establishing by mere authority a form more restricted than that which Shakspeare used.

Such is the action of existing circumstances upon genius, and the re-action of genius upon future circumstances. Shakspeare and Corneille were each the leading spirit of his age; and the difference between them is well marked by the editor of the latter. "*Corneille est inégal comme Shakspeare, et plein de génie comme lui; mais le génie de Corneille étoit à celui de Shakspeare ce qu'un seigneur est à l'égard d'un* homme de peuple *né avec le même esprit que lui.*" This distinction is strictly accurate, and contains a compliment to the English author which, assuredly, the critic did not intend to make. Corneille wrote as a courtier, circumscribed within the imaginary rules and ceremonies of a court, as a chicken is by a circle of chalk drawn round it. Shakspeare, composing for the amusement of the public alone, had within his province, not only the inexhaustible field of actual life, but the whole ideal world of fancy and superstition; more favourable to the display of poetical genius than even existing realities. Under the circumstances of Corneille, Shakspeare must have been restricted to the same dull, regular, and unvaried system. He must have written, not according to the dictates of his own genius, but in conformity to the mandate of some *intendant des menus plaisirs;* or of some minister of state, who, like Cardinal Richelieu, thought he could write a tragedy because he could govern a kingdom. It is not equally clear to what height Corneille might have ascended had he enjoyed the national immunities of Shakspeare. Each pitched down a land-mark in his art. The circle of Shakspeare was so extended, that it is with advantage liable to many restrictions; that of Corneille included a narrow limit, which his successors have deemed it unlawful to extend.

It is not our intention, within the narrow space to which our essay is necessarily limited, to enlarge upon the character and writings of Shakspeare. We can only notice his performances as events in the history of the theatre—of a gigantic character indeed, so far as its dignity, elevation, and importance are considered; but, in respect of the mere practice of the drama, rather fixing and sanctioning, than altering or reforming those rules and forms which he found already established. This we know for certain, that those historical plays or chronicles, in which Shakspeare's muse has thrown a never-fading light upon the history of his country, did, almost every one of them, exist before him in the rude shape of dry dialogue and pitiful buffoonery, stitched into scenes by the elder playwrights of the stage. His romantic dramas exhibit the same contempt of regularity which was manifested by Marlow and other writers; for where there was abuse or extreme license upon the stage, the example of Shakspeare may be often quoted as its sanction, never as tending to reform it. In these particulars the practice of our immortal bard was contrasted with that of Ben Jonson, a severe and somewhat pedantic scholar; a man whose mind was coarse, though capable both of strength and elevation, and whose strong perception of comic humour was tinctured with vulgarity.

Jonson.

Jonson's tragic strength consists in a sublime, and sometimes harsh, expression of moral sentiment; but displays little of tumultuous and ardent passion, still less of tenderness or delicacy; although there are passages in which he seems adequate to expressing them. He laboured in the mine of the classics, but overloaded himself with the ore, which he could not or would not refine. His *Cataline* and *Sejanus* are laboured translations from Cicero, Sallust, and Tacitus, which his own age did not endure, and which no succeeding generation will probably be much tempted to revive. With the stern superiority of learning over ignorance, he asserted himself a better judge of his own productions than the public which condemned him, and haughtily claimed the laurel which the public suffrage often withheld; but the world has as yet shown no disposition to reverse the opinion of their predecessors.

In comedy Jonson made some efforts partaking of the character of the older comedy of the Grecians. In his *Tale of a Tub* he follows the path of Aristophanes, and lets his wit run into low buffoonery, that he might bring upon the stage Inigo Jones, his personal enemy. In *Cynthia's Revels* and the *Staple of News,* we find him introducing the dull personification of abstract passions and qualities, and turning legitimate comedy into an allegorical mask. What interest can the reader have in such characters as the three Penny boys, and their transactions with the Lady Pecunia? Some of Jonson's more legitimate comedies may be also taxed here with filthiness of language, of which disgusting attribute his works exhibit more instances than any English writer of eminence excepting Swift. Let us, however, be just to a master-spirit of his age. The comic force of Jonson was strong, marked, and peculiar; and he excelled even Shakspeare himself in drawing that class of truly English characters, remarkable for peculiarity of *humour;* that is, for some mode of thought, speech, and behaviour, superinduced upon the natural disposition by profession, education, or fantastical affectation of singularity. In blazoning these forth with their natural attributes and appropriate language, Ben Jonson has never been excelled, and his works everywhere exhibit a consistent and manly moral, resulting naturally from the events of the scene.

It must also be remembered, that although it was Jonson's fate to be eclipsed by the superior genius, energy, and taste of Shakspeare, yet those advantages which enabled him to maintain an honourable though an unsuccessful struggle, were of high advantage to the drama. Jonson was the first who showed by example the infinite superiority of a well-conceived plot, all the parts of which bore upon each other, and forwarded an interesting conclusion over a tissue of detached scenes, following without necessary connection or increase of interest. The plot of the *Fox* is admirably conceived; and that of the *Alchymist,* though faulty in the conclusion, is nearly equal to it. In the two comedies of *Every Man in his Humour* and *Every Man out of his Humour,* the plot deserves much less praise, and is deficient at once in interest and unity of action; but in that of the *Silent Woman* nothing can exceed the art with which the circumstance upon which the conclusion turns is, until the very last scene, concealed from the knowledge of the reader, while he is tempted to suppose it constantly within his reach. In a word, Jonson is distinguished by his strength and stature, even in those days when there were giants in the land, and affords a model of a close, animated, and characteristic style of comedy, abounding in moral satire, and distinguished at once by force and art, which was afterwards more cultivated by English dramatists, than the lighter, more wild, and more fanciful department in which Shakspeare moved, beyond the reach of emulation.

The general opinion of critics has assigned genius as the characteristic of Shakspeare, and art as the appropriate excellence of Jonson; not surely that Jonson was deficient in genius, but that art was the principal character-

istic of his laborious scenes. We learn from his own confession, and from the panegyrics of his friends, as well as the taunts of his enemies, that he was a slow composer. The natural result of laborious care is jealousy of fame; for that which we do with labour, we value highly when achieved. Shakspeare, on the other hand, appears to have composed rapidly and carelessly, and sometimes even without considering, while writing the earlier acts, how the catastrophe was to be huddled up, in that which was to conclude the piece. We may fairly conclude him to have been indifferent about fame, who would take so little pains to win it. Much perhaps might have been achieved by the union of these opposed qualities, and by blending the art of Jonson with the fiery invention and fluent expression of his great contemporary. But such an union of opposite excellencies in the same author was hardly to be expected; nor perhaps would the result have proved altogether so favourable as might at first view be conceived. We should have had more perfect specimens of the art, but they must have been much fewer in number; and posterity would certainly have been deprived of that wild luxuriance of dramatic excellencies and poetic beauties, which, like wild flowers upon a common field, lie scattered profusely among the unacted plays of Shakspeare.

Massinger. Although incalculably superior to his contemporaries, Shakspeare had successful imitators, and the art of Jonson was not unrivalled. Massinger appears to have studied the works of both with the intention of uniting their excellencies. He knew the strength of plot; and although his plays are altogether irregular, yet he well understood the advantage of a strong and defined interest; and in unravelling the intricacy of his intrigues, he often displays the management of a master. Art, therefore, not perhaps in its technical, but in its most valuable sense, was Massinger's as well as Jonson's; and, in point of composition, many passages of his plays are not unworthy of Shakspeare. Were we to distinguish Massinger's peculiar excellence, we should name that first of dramatic attributes, a full conception of character, a strength in bringing out, and consistency in adhering to it. He does not, indeed, always introduce his personages to the audience in their own proper character; it dawns forth gradually in the progress of the piece, as in the hypocritical Luke, or in the heroic Marullo. But, upon looking back, we are always surprised and delighted to trace from the very beginning, intimations of what the personage is to prove as the play advances. There is often a harshness of outline, however, in the character of this dramatist, which prevents their approaching to the natural and easy portraits bequeathed us by Shakspeare.

Beaumont and Fletcher. Beaumont and Fletcher, men of remarkable talent, seemed to have followed Shakspeare's mode of composition rather than Jonson's, and thus to have altogether neglected that art which Jonson taught, and which Massinger in some sort practised. They may, indeed, be rather said to have taken for their model the boundless license of the Spanish stage, from which many of their pieces are expressly and avowedly derived. The acts of their plays are so detached from each other, in substance and consistence, that the plot scarce can be said to hang together at all, or to have, in any sense of the word, a beginning, progress, and conclusion. It seems as if the play began because the curtain rose, and ended because it fell, the author, in the mean time, exerting his genius for the amusement of the spectators, pretty much in the same manner as in the *Scenario* of the Italians, by the actors filling up, with their extempore wit, the scenes chalked out for them. To compensate for this excess of irregularity, the plays of Beaumont and Fletcher have still a high poetical value. If character be sometimes violated, probability discarded, and the interest of the plot neglected, the reader is, on the other hand, often gratified by the most beautiful description, the most tender and passionate dialogue, a display of brilliant wit and gaiety, or a feast of comic humour. These attributes had so much effect on the public, that, during the end of the seventeenth and the beginning of the eighteenth centuries, many of Beaumont and Fletcher's plays had possession of the stage, while those of Shakspeare were laid upon the shelf.

Shirley and others. Shirley, Ford, Webster, Decker, and others, added performances to the early treasures of the English drama, which abound with valuable passages. There never, probably, rushed into the lists of literary competition together a band more distinguished for talent. If the early drama be inartificial and unequal, no nation at least can show so many detached scenes, and even acts, of distinguished poetical merit. One powerful cause seems to have produced an effect so marked and distinguished, to wit, the universal favour of a theatrical public, which daily and nightly thronged the numerous theatres then open in the city of London.

Cause of the abundance of dramatic talent in this period. In considering this circumstance, it must above all be remembered that these numerous audiences crowded, not to feast their eyes upon show and scenery, but to see and hear the literary production of the evening. The scenes which the stage exhibited were probably of the most paltry description. Some rude helps to the imagination of the audience might be used by introducing the gate of a castle or town; the monument of the Capulets, by sinking a trap-door, or by thrusting in a bed. The good-natured audience readily received these hints, with that conventional allowance which Sir Philip Sidney had ridiculed, and which Shakspeare himself has alluded to when he appeals from the poverty of theatrical representation to the excited imagination of his audience.

> ....Can this cockpit hold
> The vasty fields of France? Or may we cram
> Within this wooden O, the very casques
> That did affright the air at Agincourt?
> O, pardon! since a crooked figure may
> Attest, in little space, a million;
> And let us, ciphers to this great account,
> On your imaginary forces work;
> Suppose, within the girdle of these walls,
> Are now confined two mighty monarchies,
> Whose high upreared and abutting fronts
> The perilous narrow ocean parts asunder;
> Printing their proud hoofs i' the receiving earth.
> For 'tis your thoughts that now must deck our kings,
> Carry them here and there; jumping o'er times;
> Turning the accomplishment of many years
> Into an hour-glass.........

Such were the allowances demanded by Shakspeare and his contemporaries from the public of their day, in consideration of the imperfect means and appliances of their theatrical machinery. Yet the deficiency of scenery and show, which, when existing in its utmost splendour, divides the interest of the piece in the mind of the ignorant, and rarely affords much pleasure to a spectator of taste, may have been rather an advantage to the infant drama. The spectators having nothing to withdraw their attention from the immediate business of the piece, gave it their full and uninterrupted attention. And here it may not be premature to inquire into the characteristical difference between the audiences of the present day, and those earlier theatrical ages, when the drama boasted not only the names of Shakspeare, of Massinger, of Jonson, of Beaumont and Fletcher, of Shirley, of Ford, and others of subordinate degree; the meanest of whom shows occasionally more fire than warms whole reams of modern plays. This will probably be found

to rest on the varied and contrasted feelings with which the audience of ancient and that of modern days attend the progress of the scene.

Nothing, indeed, is more certain than that the general cast of theatrical composition must receive its principal bent and colouring from the taste of the audience:

> The drama's laws, the drama's patrons give;
> For those who live to please, must please to live.

But though this be an undeniable, and in some respects a melancholy truth, it is not less certain that genius, labouring in behalf of the public, possesses the power of re-action, and of influencing in its turn that taste to which it is in some respects obliged to conform; while, on the other hand, the playwright, who aims only to catch the passing plaudit and the profit of a season, by addressing himself exclusively to the ruling predilections of the audience, degrades the public taste still farther by the gross food which he ministers to it, unless it shall be supposed that he may contribute involuntarily to rouse it from its degeneracy, by cramming it even to satiety and loathing. This action, therefore, and re-action of the taste of the age on dramatic writing, and *vice versa*, must be both kept in view when treating of the difference betwixt the days of Shakspeare and our own.

Perhaps it is the leading distinction betwixt the ancient and modern audiences, that the former came to listen and to admire; to fling the reins of their imaginations into the hands of the authors and actors, and to be pleased, like the reader to whom Sterne longed to do homage, " they knew not why, and cared not wherefore." The novelty of dramatic entertainments (for there elapsed only about twenty years betwixt the date of *Gammer Gurton's Needle*, accounted the earliest English play, and the rise of Shakspeare) must have had its natural effect upon the audience. The sun of Shakspeare arose almost without a single gleam of intervening dawn; and it was no wonder that the audience, introduced to this enchanting and seductive art at once, under such an effulgence of excellence, should have been more disposed to wonder than to criticise; to admire, or rather to adore, than to measure the height or ascertain the course of the luminary which diffused such glory around him. The great number of theatres in London, and the profusion of varied talent which was dedicated to this service, attest the eagerness of the public to enjoy the entertainments of the scene. The ruder amusements of the age lost their attractions; and the royal bear-ward of Queen Elizabeth lodged a formal complaint at the feet of her majesty, that the play-houses had seduced the audience from his periodical bear-baitings. This fact is worth a thousand conjectures; and we can hardly doubt that the converts, transported by their improving taste from the bear-garden to the theatre, must, generally speaking, have felt their rude minds subdued and led captive by the superior intelligence, which not only placed on the stage at pleasure all ranks, all ages, all tempers, all passions of mere humanity, but extended its powers beyond the bounds of time and space, and seemed to render visible to mortal eyes the secrets of the invisible world. We may, perhaps, form the best guess of the feelings of Shakspeare's contemporary audience, by recollecting the emotions of any rural friend, of rough but sound sense and ardent feelings, whom we have had the good fortune to conduct to a theatre for the first time in his life. It may be well imagined that such a spectator thinks little of the three dramatic unities, of which Aristotle says so little, and his commentators and followers talk so much; and that the poet and the performers have that enviable influence over his imagination, which transports him from place to place at pleasure, crowds years into the course of hours, and interests him in the business of each scene, however disconnected from the others. His eyes are riveted to the stage, his ears drink in the accents of the speakers, and he experiences in his mature age, what we have all felt in childhood, a sort of doubt whether the beings and business of the scene be real or fictitious. In this state of delightful fascination, Shakspeare and the gigantic dramatic champions of his age found the British public at large; and how they availed themselves of the advantages which so favourable a temper afforded them, their works will show so long as the language of Britain continues to be read. It is true that the enthusiastic glow of the public admiration, like the rays of a tropical sun darted upon a rich soil, called up in profusion weeds as well as flowers; and that, spoiled in some degree by the indulgent acceptation which attended their efforts, even our most admired writers of Elizabeth's age not unfrequently exceeded the bounds of critical nicety, and even of common taste and decorum. But these eccentricities were atoned for by a thousand beauties, to which, fettered by the laws of the classic drama, the authors would hardly have aspired, or, aspiring, would hardly have attained. All of us know and feel how much the exercise of our powers, especially those which rest on keen feeling and self-confidence, is dependent upon a favourable reception from those for whom they are put in action. Every one has observed how a cold brow can damp the brilliancy of wit and fetter the flow of eloquence; and how both are induced to send forth sallies corresponding in strength and fire, upon being received by the kindred enthusiasm of those whom they have addressed. And thus, if we owe to the indiscriminate admiration with which the drama was at first received, the irregularities of the authors by whom it was practised, we also stand indebted to it, in all probability, for many of its beauties, which became of rare occurrence, when, by a natural, and indeed a necessary change, satiated admiration began to give way to other feelings.

When a child is tired of playing with a new toy, its next delight is to examine how it is constructed; and, in like manner, so soon as the first burst of public admiration is over with respect to any new mode of composition, the next impulse prompts us to analyse and to criticise what was at first the subject of vague and indiscriminate wonder. In the first instance, the toy is generally broken to pieces; in the other, while the imagination of the authors is subjected to the rigid laws of criticism, the public generally lose in genius what they may gain in point of taste. The author who must calculate upon severe criticism turns his thoughts more to avoid faults than to attain excellence, as he who is afraid to stumble must avoid rapid motion. The same process takes place in all the fine arts; their first productions are distinguished by boldness and irregularity; those which succeed, by a better and more correct taste, but also by inferior and less original genius.

The original school founded by Shakspeare and Ben Jonson, continued by Massinger, Beaumont and Fletcher, Shirley, Ford, and others, whose compositions are distinguished by irregularity as well as genius, was closed by the breaking out of the great civil war in 1642. The stage had been the constant object of reprobation and abhorrence on the part of the puritans, and its professors had no favour to expect at their hands if victorious. We read, therefore, with interest, but without surprise, that almost all the actors took up arms in behalf of their old master King Charles, in whose service most of them perished. Robinson, a principal actor at the Blackfriars, was killed by Harrison in cold blood, and under the application of a text of scripture,—" Cursed is he that doeth the work of the Lord negligently." A few survivors endeavoured occasionally to practise their art in secrecy and obscurity,

Drama.

but were so frequently discovered, plundered and stripped by the soldiers, that "*Enter the red-coat, Exit hat and cloak,*" was too frequent a stage direction. Sir William Davenant endeavoured to evade the severe zealots of the time, by representing a sort of opera, said to have been the first drama in which moveable scenery was introduced upon the stage. Even the cavaliers of the more grave sort disapproved of the revival of these festive entertainments during the unstable and melancholy period of the interregnum. "I went," says the excellent Evelyn, in his *Diary*, 5th May 1658, "to see a new opera after the Italian way; in recitation, music, and scenes, much inferior to the Italian composure and magnificence; but it was prodigious that in such a time of public consternation, such a variety should be kept up or permitted, and being engaged with company, could not decently resist the going to see it, though my heart smote me for it." Davenant's theatrical enterprise, abhorred by the fanaticism of the one party, and ill adapted to the dejected circumstances of the other, was not probably very successful.

Second period of the English drama.

II. With royalty the stage revived in England. But the theatres in the capital were limited to two, a restriction which has never since been extended. This was probably by the advice of Clarendon, who endeavoured, though vainly, to stem at all points the flood of idle gaiety and dissipation which broke in after the Restoration. The example of France might reconcile Charles to this exertion of royal authority. With this restoration of the drama, as well as of the crown, commences the second part of English dramatic history.

Charles II. had been accustomed to enjoy the foreign stage during his exile, and had taste enough to relish its beauties. It is probable, however, that his judgment was formed upon the French model, for few of the historical or romantic dramas were revived at the restoration. So early as 26th of November 1662, the *Diary* of Evelyn contains this entry: "I saw Hamlet, Prince of Denmark, played; but now the old plays began to disgust this refined age, since his majesty has been so long abroad." Dryden, Howard, and others, who obtained possession of the stage, introduced what was for some time called Heroic Plays, written in couplets, and turning upon the passions of love and honour. In the dialogue, these pieces resembled that of the French stage, where the actors declaim alternately in the best language and in the finest thoughts which the poet can supply, but without much trace of natural passion or propriety of character. But though French in dialogue and sentiment, the heroic plays were English in noise and bustle, and the lack of truth and nature was supplied by trumpets and tempests, victories and processions. An entertainment of a character so forced and unnatural was obviously of foreign growth, and flowed from the court. Dryden himself has assured us "that the favour which heroic plays had acquired upon the stage was entirely owing to the countenance which they had received at court; and that the most eminent persons for wit and humour in the royal circle had so far honoured them, that they judged no way so fit as verse to entertain a noble audience, or express a noble passion." In these pieces the unities were not observed; but in place of the classical restrictions, there were introduced certain romantic whimsical limitations of the dramatic art, which, had they been adopted, must soon have destroyed all its powers of pleasing. The characters were avowedly formed upon the model of the French romance, where honour was a sort of insane gasconading extravagance, and who seem to have made a vow never to speak or think of any thing but love, and that in language sometimes ingeniously metaphysical, sometimes puerile to silliness, sometimes mad even to raving, but always absurd, unnatural, and extravagant. In point of system it was stated, that a heroic play should be an imitation of a heroic poem. The laws of such compositions did not, it was said, dispense with those of the elder drama, but exalted them, and obliged the poet to draw all things as far above the ordinary proportion of the stage, as the stage itself is beyond the common words and actions of human life. The effects which a heroic play, constructed upon such an overstrained model, produced, is well described by Mrs Evelyn, wife of the author of that name already quoted, in a letter to Mr Bohun, written in 1671. "Since my last to you I have seen the *Siege of Grenada*, a play so full of ideas, that the most refined romance I ever read is not to compare with it. Love is made so pure, and valour so nice, that one would imagine it designed for an Utopia rather than our stage. I do not quarrel with the poet, but admire one born in the decline of morality should be able to feign such exact virtue; and as poetic fiction has been instructive in former ages, I wish this the same event in ours. As to the strict law of comedy, I dare not pretend to judge. Some think the division of the story not so well as if it could all have been comprehended in the day of action. Truth of history, exactness of time, possibilities of adventures, are niceties which the ancient critics might require; but those who have outdone them in fine notions may be allowed the liberty to express them their own way, and the present world is so enlightened that the old dramatique must bear no sway. This account perhaps is not enough to do *Mr Driden* right, yet is as much as you can expect from the leisure of one who has the care of a nursery." (See Evelyn's *Works.*) This ingenious lady felt what, overawed by the fashion of the moment, she has intimated rather than expressed; namely, that the heroic drama, notwithstanding the fine poetry of which it may be made the vehicle, was overstrained, fantastical, and unnatural.

Introduction of the heroic plays.

In comedy, also, there was evinced, subsequent to the Restoration, a kindred desire of shining in dialogue rather than attempting the humorous delineation of character of which Shakspeare, Jonson, and the earlier schools, had set the example. The comic author no longer wrote to move the hearty laugh of a popular assembly, but to please a fashionable circle, "the men of wit and pleasure about town," with whom wit and raillery is always more prevailing than humour. As in tragedy, therefore, the authors exhausted trope and figure, and reduced to logic the language of heroic passion; so in comedy, a succession of smart jests, which neither serve to advance the action of the piece, nor display the character of the speaker, was bandied to and fro upon the stage.

Heroic plays superseded by dramas of a more natural structure.

Satire is the appropriate corrective of extravagance in composition; and the *Rehearsal* of the Duke of Buckingham, though it can scarcely be termed a work of uncommon power, had yet the effect of holding up to public ridicule the marked and obvious absurdities of the revived drama in both its branches. After the appearance of this satire, a taste too extravagant for long endurance was banished from the theatre; both tragedy and comedy retraced their steps, and approached more nearly to the field of human action, passion, and suffering; and, down to the revolution, a more natural style of drama occupied the stage. It was supported by men of the highest genius, who, but for one great leading error, might perhaps have succeeded in giving to the art its truest and most energetic character. The talents of Otway, in his scenes of passionate affection, rival at least, and sometimes excel, those of Shakspeare. More tears have been shed, probably, for the sorrows of Belvidera and Monimia than for those of Juliet and Desdemona. The introduction of actresses upon the stage was scarcely known before the Restoration, and it furnished the poets of the latter period

with appropriate representatives for their female characters. This more happy degree of personification, as it greatly increased the perfection of the scene, must have animated in proportion the genius of the author. A marked improvement, therefore, may be traced in love scenes, and, indeed, in all those wherein female characters are introduced; that which was to be spoken by a fitting representative was of course written with more care, as it was acted with greater effect. This was an advantage, and a great one, possessed by the theatre succeeding the Restoration. Great dramatic force and vigour marked the dramatic compositions of this age. It was not, indeed, equal to that of Shakspeare, either in point of the talent called forth, or the quantity of original poetry given to the public; but Otway, and even Lee, notwithstanding his bombastic rant, possessed considerable knowledge of dramatic art and stage-effect. Several plays of this period have kept possession of the stage; less perhaps on account of intrinsic merits, than because some of the broad errors of the earlier age had been removed, and a little more art had been introduced in the combination of the scenes, and disentanglement of the plot. The voice of criticism was frequently heard; the dramatic rules of the ancients were known and quoted; and though not recognized in their full extent, had nevertheless some influence in regulating the action of the drama.

Gross immorality of the drama.

In one heinous article, however, the poets of this age sinned at once against virtue, good taste, and decorum; and endangered, by the most profligate and shameless indecency, the cause of morality, which has been often considered as nearly allied with that of the legitimate drama. In the first period of the British stage, the actors were men of decent character, and often acquired considerable independence. The women's parts were acted by boys. Hence, although there were too many instances of low and licentious dialogue, there were few of that abominable species which addresses itself, not to the fancy, but to the passions, and is seductive, instead of being ludicrous. Had Charles II. borrowed from the French monarchs the severe etiquette of their court, when he introduced into England something resembling the style of their plays, he would have asserted what was due to his own dignity, and the cause of sound morals and good manners, by prohibiting this vulgar and degrading license, which in itself was insulting to the presence of a king. It was, however, this prince's lot, in the regulation of his amusements, as well as in his state government, to neglect self-respectability. In his exile he had been "merry, scandalous, and poor;" had been habituated to share familiarly coarse jests and loose pleasures with his dissolute companions; and unfortunately he saw no reason for disusing the license to which he had accustomed himself, when it was equally destructive to his own character and to decorum. What had been merely coarse was, under his influence, rendered vicious and systematic impurity. Scenes, both passionate and humorous, were written in such a style as if the authors had studied whether the grave seduction of the heroic, or the broad infamy of the comic scenes, should contain the grossest insult to public decency. The female performers were of a character proper to utter whatever ribaldry the poet chose to put into their mouths; and as they practised what they taught, the king himself, and the leading courtiers, formed connections which gave the actress a right to be saucy in their presence, and to reckon upon their countenance when practising in public the effrontery which marked their intercourse in private life. How much this shocked the real friends of Charles, is shown by its effects upon Evelyn, whose invaluable *Diary* we have already quoted: "This night was acted my Lord Broghill's tragedy called Mustapha, before their majesties at court, at which I was present; though very seldom now going to the public theatres, for many reasons, as they are now abused to an atheistical liberty. Foul and indecent women now, and never till now, are permitted to appear and act, who, inflaming several young noblemen and gallants, became their misses, and some their wives: witness the Earl of Oxford, Sir R. Howard, P. Rupert, the Earl of Dorset, and another greater person than any of them, who fell into their snares, to the reproach of their noble families, and ruin of both body and soul." He elsewhere repeatedly expresses his grief and disgust at the pollution and degeneracy of the stage. (Evelyn's *Works*, vol. i. p. 392.) In a letter to Lord Cornbury (son of the great Clarendon), he thus expresses himself: "In the town of London there are more wretched and indecent plays permitted than in all the world besides;" and adds shortly after, "If my Lord Chancellor would but be instrumental in reforming this one exorbitancy, it would gain both the king and his lordship multitudes of blessings. You know, my lord, that I (who have written plays, and am a scurvy poet too sometimes) am far from puritanisme; but I would have no reproach left our adversaries, in a theme which may so conveniently be reformed. Plays are now with us become a licentious exercise, and a vice, and neede severe censors, that should look as well to their morality as to their lines and numbers." And, at the hazard of multiplying quotations, we cannot suppress the following:—1st March 1671. "I walked with him (the king) through St James's Park to the garden, where I both heard and saw a very familiar discourse betwixt— (*i. e.* the king) and Mrs Nelly (Gwyn), as they called an impudent comedian, she looking out of her terrace at the top of the wall, and —— [the king] standing in the green walk under it. I was heartily sorry at this scene."

The foul stain, so justly censured by a judge so competent and so moderate as Evelyn, was like that of the leprosy in the Levitical law, which sunk into and pervaded the very walls of the mansion; it became the leading characteristic of the English theatre, of its authors, and of its players. It was, however, especially in comedy that this vice was most manifest; and, to say truth, were not the eyes of antiquaries, like the ears of confessors, free from being sullied by the impurities committed to them, the comedies of this period, as well as the comic scenes introduced to relieve the tragedies, are fitter for a brothel than for the library of a man of letters.

It is a pity that we are under the necessity of drawing the character of the drama at this age from a feature so coarse and disgusting. Unquestionably, as the art in other respects made progress, it might, but for this circumstance, have reached an uncommon pitch of perfection. The comedies of Congreve contain probably more wit than was ever before embodied upon the stage; each word was a jest, and yet so characteristic, that the repartee of the servant is distinguished from that of the master; the jest of the coxcomb from that of the humorist or fine gentleman of the piece. Had not Sheridan lived in our own time, we could not have conceived the possibility of rivalling the comedies of Congreve. This distinguished author understood the laws of composition, and combined his intrigue with an art unusual on the British stage. Nor was he without his rivals, even where his eminence was most acknowledged. Vanburgh and Farquhar, inferior to Congreve in real wit, and falling into the next period, were perhaps his equals in the composition of acting plays. Like other powerful stimulants, the use of wit has its bounds, which Congreve is supposed sometimes to have exceeded. His dialogue keeps the attention too much upon the stretch, and, however delightful in the closet, fatigues the mind during the action. When you are per-

petually conscious that you lose something by the slightest interruption of your attention, whether by accident or absence of mind, it is a state of excitement too vivid and too constant to be altogether pleasant; and we feel it possible that we might sometimes wish to exchange a companion of such brilliant powers, for one who would afford us more repose and relaxation.

The light, lively, but somewhat more meagre dialogue of the latter dramatists of the period, and of that which succeeded, was found sufficient to interest, yet was not so powerful as to fatigue the audience. Vanburgh and Farquhar seemed to have written more from the portraits of ordinary life; Congreve from the force of his own conception. The former, therefore, drew the characters of men and women as they found them; selected, united, and heightened for the purpose of effect, but without being enriched with any brilliancy foreign to their nature. But all the personages of Congreve have a glimpse of his own fire, and of his own acuteness. He could not entirely lay aside his quick powers of perception and reply, even when he painted a clown or a coxcomb; and all that can be objected, saving in a moral sense, to this great author, is his having been too prodigal of his wit; a faculty used by most of his successors with rigid economy.

That personification of fantasy or whim called characters of humour, which Ben Jonson introduced, was revived during this period. Shadwell, now an obscure name, endeavoured to found himself a reputation, by affecting to maintain the old school, and espousing the cause of Ben Jonson against Dryden and other innovators. But although there was considerable force of humour in some of his forgotten plays, it was Wycherly upon whom fell the burthen of upholding the standard of the Jonsonian school. The *Plain Dealer* is indeed imitated from Molière; but the principal character has more the force of a real portrait, and is better contrasted with the perverse, bustling, masculine, petty-fogging, and litigious character of Widow Blackacker, than Alceste is with any of the characters in the *Misanthrope*. The other plays of this author are marked by the same strong, masculine, and forcible painting, which approaches more to the satire of Jonson, than to the ease of Vanburgh, the gaiety of Farquhar, or the wit of Congreve. Joining, however, the various merits of these authors, as belonging to this period, they form a galaxy of comic talent scarce to be matched in any other age or country; and which is only obscured by those foul and impure mists which their pens, like the raven wings of Sycorax, had brushed from fern and bog.

Morals repeatedly insulted long demanded an avenger; and he arose in the person of Jeremy Collier. It is no disgrace to the memory of this virtuous and well-meaning man, that, to use the lawyer's phrase, he pleaded his cause too high; summoned unnecessarily to his aid the artillery with which the Christian fathers had fulminated against the heathen drama; and pushing his arguments to extremity, directed it as well against the use as against the abuse of the stage. Those who attempted to reply to him availed themselves, indeed, of the weak parts of his arguments; but, upon the main points of impeachment, the poets stood self-convicted. Dryden made a manly and liberal submission, though not without some reflections upon the rudeness of his antagonist's attacks. "I shall say the less of Mr Collier, because in many things he has taxed me justly; and I have pleaded guilty to all thoughts and expressions of mine which can be truly accused of obscenity, profaneness, or immorality, and retract them. If he be my enemy, let him triumph; if he be my friend, as I have given him no occasion to be otherwise, he will be glad of my repentance. It becomes me not to draw my pen in the defence of a bad cause, when I have so often drawn it for a good one. Yet it were not difficult to prove, that in many places he has perverted my meaning by his glosses, and interpreted my words into blasphemy and bawdry, of which they were not guilty; besides, that he is too much given to horse-play in his raillery, and comes from battle like a dictator from the plough. I will not say, 'the zeal of God's house has eaten him up;' but I am sure it has devoured some part of his good manners and civility." Congreve, less prudent, made an angry and petulant defence, yet tacitly admitted the charge brought against him, by retrenching in the future editions of his plays, passages of grossness and profaneness, which the restless antiquary still detects in the early copies. And, on the whole, Collier's satire was attended with such salutary effects, that men started at the mass of impudence and filth which had been gradually accumulated in the theatre during the last reigns; and if the Augean stable was not sufficiently cleansed, the stream of public opinion was fairly directed against its conglomerated impurities. Since that period, indecency, that easy substitute for wit and pleasantry, has been gradually banished from the drama, where the conversation is now (according to Sheridan) at least always moral, if not entertaining.

During the second period of the British drama, great improvement was made in point of art. The principles of dramatic composition were more completely understood, and the poets themselves had written so much upon the subject, that, as Dryden somewhere complains, they had taught their audience the art of criticising their performances. They did not, however, so far surrender the liberties and immunities of their predecessors, as to receive laws from the French critics. The rules of the unities were no further adopted by Otway, Congreve, and the writers of the time, than their immediate purpose admitted. It was allowed on all hands that unnecessary and gross irregularities were to be avoided, but no precise rule was adopted. Poets argued upon the subject according to caprice, and acted according to convenience. Gross and palpable extensions of time, and frequent changes of place, were avoided; and, unless in tragi-comedies, authors studied to combine the intrigue of their play into one distinct and progressive action. The genius by which this art was supported was neither so general nor so profuse as that which decorated the preceding period. It was enough, however, to support the honour of the drama; and if the second period has produced fewer masterpieces of talent, it has exhibited more plays capable of being acted.

Third period of the English drama.

III. In the third period of dramatic history, the critics began to obtain an authority for which they had long struggled, and which might have proved fatal to the liberties of the stage. It is the great danger of criticism, when laying down abstract rules without reference to any example, that these regulations can only apply to the form, and never to the essence, of the drama. They may assume that the plot must be formed on a certain model, but they cannot teach the spirit which is to animate its progress. They cannot show how a passion should be painted, but they can tell to a moment when the curtain should be dropped. The misfortune is, that, while treating of these subordinate considerations, critics exalt them to an undue importance in their own minds and that of their scholars. What they carve out for their pupils is a mere dissection of a lifeless form; the genius which animated it escapes, as the principle of life glided from the scalpel of those anatomists who sought to detect it in the earlier days of that art. Rymer had, as early as 1688, discovered that our poetry of the last age was as rude as its architecture. "One cause thereof," he continues.

"might be, that Aristotle's *Treatise of Poetry* has been so little studied amongst us; it was, perhaps, commented upon by all the great men in *Italy*, before we well knew (on this side of the Alps) that there was such a book in being." Accordingly, Rymer endeavours to establish what he calls the Rule of Reason over Fancy, in the contrivance and economy of a play. "Those who object to this subjugation," he observes, "are mere fanatics in poetry, and will never be saved by their good works." The species of reason, however, to which Rymer appeals, resembles, in its occult nature, that which lies hidden in the depths of municipal law, and which is better known to the common class of mankind under the name of Authority. Because Aristotle assigns Pity and Terror as the objects of tragedy, Rymer resumes the proposition, that no other source of passion can be legitimate. To this he adds some arbitrary rules, of which it would be difficult to discover the rationale. It was the opinion, we are told, of the ancients, "that comedy (whose province was humour and ridiculous matter only) was to represent worse than the truth, history to describe the truth, but tragedy was to invent things better than the truth. Like good painters, they must design their images like the life, but yet better and more beautiful than the life. The malefactor of tragedy must be a better sort of malefactor than those that live in the present age: For an obdurate, impudent, and impenitent malefactor, can neither move compassion nor terror, nor be of any imaginable use in tragedy." It would be difficult to account for these definitions upon any logical principle, and impossible for an admirer of the drama to assent to a rule which would exclude from the stage Iago and Richard III. It is equally difficult to account for the *rationale* of the following dogmas: "If I mistake not, in poetry no woman is to kill a man, except her quality gives her the advantage above him; nor is a servant to kill his master; nor a private man, much less a subject, to kill a king, nor on the contrary. Poetical decency will not suffer death to be dealt to each other by such persons, whom the laws of duel allow not to enter the lists together." (Rymer's *View of the Tragedies of the Last Age.*) Though for these and similar critical conceits it would be difficult to find any just principle, nevertheless, Rymer, Dennis, and other critics, who, mixing observations founded on sound judgment and taste, with others which rested merely upon dauntless assertion, or upon the opinions of Aristotle, began thereby to extend their authority, and produce a more than salutary influence upon the drama. It is true, that both of the aristarchs whom we have named were so ill advised as themselves to attempt to write plays, and thereby most effectually proved that it was possible for a drama to be extremely regular, and at the same time intolerably dull. Gradually, however, their precepts, in despite of their example, gained influence over the stage. They laid down rules in which the audience were taught to regard the trade of a connoisseur as easy and soon learned; and the same quantity of technical jargon which, in the present day, constitutes a judge of painting, was, in the beginning of the eighteenth century, sufficient to elevate a templar into a dramatic critic. The court of criticism, though self-constituted, was sufficiently formidable, since they possessed the power of executing their own decrees. Many authors made their submission; amongst others, Congreve humbled himself in the *Mourning Bride;* and Addison, with anxious and constitutional timidity, sacrificed to the unities in his celebrated tragedy of *Cato.* Being in form and essence rather a French than an English play, it is one of the few English tragedies which foreigners have admired. It was translated into Italian, and admired as a perfect model by Riccoboni, although his taste condemns the silly love intrigue. Its success was contagious. Southerne and Rowe may be considered as belonging to the same school; although the former admired Shakspeare, and the latter formed himself, in some degree, on the model of Otway. Translations of French tragedies became every day more frequent; and their diction and style of dialogue was imitated upon the British stage. The language of tragedy no longer expressed human passion, or intimated what the persons of the drama actually felt, but described and debated alternately what they ought to feel; and sounding sentences, and long similes, exhibiting an active fancy and a cold imagination, supplied at once the place of force and of pathos.

Unfavourable influence of dramatic criticism.

The line between comedy and tragedy was now strictly drawn. The latter was no longer permitted to show that strain of heroic humour which exhibits itself in the character of Falconbridge, Hotspur, and Henry V., as well as Mercutio. All was to be cold and solemn, and in the same key of dull, grave state. Neither was comedy relieved by the touches of pathetic tenderness, and even sublimity, which are to be found in the romantic plays of the earlier period. To compensate the audience for the want of this beautiful variety of passion and feeling, Southerne, as Otway had done before him, usually introduces a few scenes of an under-plot, containing the most wretched and indecent farce, which was so slightly and awkwardly dovetailed into the original tragedy, that they have since been cancelled as impertinent intrusions, without being so much as missed. Young, Thomson, and others who followed the same wordy and declamatory system of composition, contributed rather to sink than to exalt the character of the stage. The two first were both men of excellent genius, as their other writings have sufficiently testified; but, as dramatists, they wrought upon a false model, and their productions are of little value.

It is a remarkable instance of the decay of dramatic art at this period, that several of the principal authors of the time felt themselves at liberty to write imitations of old plays belonging to the original school, by way of adapting them to the taste of their own age. The *Fair Penitent* of Rowe is well known as a poor imitation of Massinger's *Fatal Dowry.* It does not greatly excel the original in the management and conduct of the piece; and, in every thing else, falls as far beneath it as the baldest translation can sink below the most spirited original.

It would appear that the players of this period had adopted a mode of acting correspondent to the poetical taste of the time. Declamation seems to have been more in fashion in the school of Booth and Betterton than that vivacity of action that exhibits at once with word, eye, and gesture, the immediate passion which it is the actor's part to express. "I cannot help," says Cibber, "in regard to truth, remembering the rude and riotous havock we made of all the late dramatic honours of the theatre: all became at once the spoil of ignorance and self-conceit. Shakespeare was defaced, and tortured in every signal character; *Hamlet* and *Othello* lost, in one hour, all their good sense, their dignity, and fame; *Brutus* and *Cassius* became noisy blusterers, with bold unmeaning eyes, mistaken sentiments, and turgid elocution." (Cibber's *Memoirs.*)

Lillo endeavours to enlarge the sphere of tragedy.

A singular attempt to deviate from the prevailing taste in tragedy was made by Lillo, with the highly laudable purpose of enlarging the sphere of dramatic utility. He conceived that plays founded upon incidents of private life might carry more immediate conviction to the mind of the hearers, and be the means of stifling more vices in the bud, than those founded on the more remote and grander events of history. Accordingly, he formed his plots from domestic crimes, and his characters never rose

Drama.

above the ranks of middle life. Lillo had many requisites for a tragedian; he understood, either from innate taste or critical study, the advantage to be derived from a consistent fable; and, in the tragedy of the *Fatal Curiosity*, he has left the model of a plot, in which, without the help of any exterior circumstances, a train of events operating upon the characters of the dramatic persons produce a conclusion at once the most dramatic and the most horrible that the imagination can conceive. Neither does it appear that, as a poet, Lillo was at all inferior to others of his age. He possessed a beautiful fancy; and much of his dialogue is as forcibly expressed as it is well conceived. On some occasions, however, he sinks below his subject; and on others, he appears to be dragged down to the nether sphere in which it is laid, and to become cold and creeping, as if depressed with the consciousness that he was writing upon a mean subject. *George Barnwell* never rises above an idle and profligate apprentice; Milwood's attractions are not beyond those of a very vulgar woman of the town; Thoroughgood, as his name expresses, is very worthy and very tiresome; and there is, positively, nothing to redeem the piece, excepting the interest arising from a tale of horror, and the supposed usefulness of the moral. The *Fatal Curiosity* is a play of a very different cast, and such as might have shaken the Grecian stage even during the reign of terror. But the powers of the poet prove unequal to the concluding horrors of his scene. Old Wilmot's character, as the needy man who had known better days, exhibits a mind naturally good, but prepared for acting evil, even by the evil which he has himself suffered, and opens in a manner which excites the highest interest and expectation. But Lillo was unable to sustain the character to the close. After discovering himself to be the murderer of his son, the old man falls into the common cant of the theatre; he talks about computing sands, increasing the noise of thunder, adding water to the sea, and fire to Ætna, by way of describing the excess of his horror and remorse; and becomes as dully desperate, or as desperately dull, as any other despairing hero in the last scene of a fifth act.

Genteel comedy.

During this third period of the drama, comedy underwent several changes. The department called genteel comedy, where the persons as well as the foibles ridiculed were derived chiefly from high life, assumed a separate and distinct existence from that which ransacked human nature at large for its subject. Like the tragedy of the period, this particular species of comedy was borrowed from the French. It was pleasing to the higher classes, because it lay within their own immediate circle, and turned upon the topics of gallantry, persiflage, affectation, and raillery. It was agreeable to the general audience, who imagined they were thereby admitted into the presence of their betters, and enjoyed their amusement at their expense. The *Careless Husband* of Cibber is, perhaps, the best English play on this model. The general fault to which they are all liable is their tendency to lower the tone of moral feeling; and to familiarize men, in the middling, with the cold, heartless, and selfish system of profligate gallantry practised among the higher ranks. We are inclined to believe that, in a moral point of view, genteel comedy, as it has been usually written, is more prejudicial to public morals, than plays the tendency of which seems at first more grossly vicious. It is not so probable that the *Beggar's Opera* has sent any one from the two-shilling gallery to the highway, as that a youth entering upon the world, and hesitating between good and evil, may be determined to the worse course by the gay and seductive example of *Lovemore* or *Sir Charles Easy*. At any rate, the tenderness with which vices are shaded off into foibles familiarizes them to the mind of the hearer, and gives a false colouring to those crimes which should be placed before the mind in their native deformity. But the heaviness of this class of plays, and the difficulty of finding adequate representatives for those characters which are really well drawn, are powerful antidotes to the evil which we complain of. That which is dully written, and awkwardly performed, will not find many imitators.

Comedy of intrigue.

The genteel comedy being a plant of foreign growth, never obtained exclusive possession of the English stage, any more than court dresses have been adopted in our private societies. The comedy of intrigue, borrowed, perhaps, originally from the Spaniards, continued to be written and acted with success. Many of Cibber's pieces, of Centlivre's, and others, still retain their place on the stage. This is a species of comedy easily written, and seen with pleasure, though consisting chiefly of bustle and complicated incident; and requiring much co-operation of the dress-maker, scene-painter, and carpenter. After all the bustle, however, of surprise, and disguise, and squabble; after every trick is exhausted, and every stratagem played off, the writer too often finds himself in a labyrinth from which a natural mode of extrication seems altogether impossible. Hence the intrigue is huddled up at random; and the persons of the drama seem, as if by common consent, to abandon their dramatic character before throwing off their stage-dresses. The miser becomes generous; the peevish cynic good humoured; the libertine virtuous; the coquette is reformed; the debauchee is reclaimed; all vices natural and habitual are abandoned by those most habitually addicted to them: a marvellous reformation, which is brought about entirely from the consideration that the play must now be concluded. It was when pressed by this difficulty that Fielding is said to have damned all fifth acts.

English opera.

The eighteenth century, besides genteel comedy, and comedy of intrigue, gave rise to a new species of dramatic amusement. The Italian opera had been introduced into this country at a great expense, and to the prejudice, as it was supposed, of the legitimate drama. Gay, in aiming at nothing beyond a parody of this fashionable entertainment, and making it the vehicle of some political satire against Sir Robert Walpole's administration, unwittingly laid the foundation of the English opera. The popularity of his piece was unequalled; partly owing to its peculiar humour, partly to its novelty, partly to the success of the popular airs, which every body heard with delight, and partly to political motives. The moral tendency of the *Beggar's Opera* has been much questioned; although, in all probability, the number of highwaymen is not more increased by the example of Macheath, than that of murderers is diminished by the catastrophe of George Barnwell. Many years ago, however, an unhappy person, rather from a perverted and most misplaced ambition, than from the usual motives of want and desperation, chose, though in easy circumstances, and most respectably connected, to place himself at the head of a band of thieves and housebreakers, whose depredations he directed and shared. On the night on which they committed the crime for which he suffered, and when they were equipped for the expedition, he sung to his accomplices the chorus of the *Beggar's Opera*, "Let us take the road." But his confederates, professional thieves, and who pursued, from habit and education, the desperate practices which Mr B—— adopted from an adventurous spirit of profligate quixotry, knew nothing at all of Gay or the *Beggar's Opera;* and, in their several confessions and testimonies, only remembered something of a *flash-song*, about "turning lead to gold." This curious circumstance, while it tends to show that the drama may affect the weak part of a mind, predisposed to evil by a diseased imagina-

tion, proves the general truth of what Johnson asserts in the *Life of Gay*, that "highwaymen and housebreakers seldom mingle in any elegant diversions; nor is it possible for any one to imagine that he may rob with safety because he sees Macheath reprieved on the stage."

This play is now chiefly remarkable as having given rise to the English opera. In this pleasing entertainment, it is understood that the plot may be light and the characters superficial, provided that the music be good and adapted to the situation, the scenes lively and possessed of comic force. Notwithstanding the subordinate nature of this species of composition, it approaches, perhaps, more closely to the ancient Grecian drama than any thing which retains possession of our stage. The subjects, indeed, are as totally different as the sublime from the light and the trivial. But, in the mixture of poetry and music, and in the frequent introduction of singing characters unconnected with the business of the piece, and therefore somewhat allied to the chorus, the English opera has some general points of resemblance with the Grecian tragedy. This species of dramatic writing was successfully practised by Bickerstaff, and has been honoured by the labours of Sheridan.

Fourth period of the English drama.

IV. With the fourth era of our dramatic history commenced a return to a better taste, introduced by the celebrated David Garrick. The imitations of French tragedy, and the tiresome uniformity of genteel comedy, were ill adapted to the display of his inimitable talent. And thus, if the last generation reaped many hours of high enjoyment from the performances of this great actor, the present is indebted to him for having led back the public taste to the dramas of Shakspeare.

Revival of the plays of Shakspeare.

The plays of this great author had been altogether forgotten, or so much marred and disguised by interpolations and alterations, that he seems to have arisen on the British stage with the dignity of an antique statue disencumbered from the rubbish in which it had been enveloped since the decay of the art. But, although Garrick showed the world how the characters of Shakspeare might be acted, and so far paved the way for a future regeneration of the stage, no kindred spirit arose to imitate his tone of composition. His supremacy was universally acknowledged; but it seemed as if he was regarded as an object of adoration, not of imitation; and that authors were as much interdicted the treading his tragic path, as the entering his magic circle. It was not sufficiently remembered that the faults of Shakspeare, or rather of his age, are those into which no modern dramatist is likely to fall; and that he learned his beauties in the school of nature, which is ever open to all who profess the fine arts. Shakspeare may, indeed, be inimitable, but there are inferior degress of excellence, which talent and study cannot fail to attain; and the statuary were much to blame who, in despair of modelling a Venus like that of Phidias, should set himself to imitate a Chinese doll. Yet such was the conduct of the dramatists of Britain long after the supremacy of Shakspeare had been acknowledged. He reigned a Grecian prince over Persian slaves; and they who adored him

Tragedy of this period

did not dare attempt to use his language. The tragic muse appeared to linger behind the taste of the age, and still used the constrained and mincing measure which she had been taught in the French school. Hughes, Cumberland, and other men of talent, appeared in her service; but their model remained as imperfect as ever; and it was not till our own time that any bold efforts were made to restore to tragedy that truth and passion, without which declamation is only rant and impertinence. Horace Walpole, however, showed what might be done by adopting a more manly and vigorous style of composition; and Home displayed the success of a more natural current of passion. The former, chusing a theme not only totally unfit for representation, but from which the mind shrinks in private study, treated it as a man of genius, free from the trammels of habit and of pedantry. His characters in the *Mysterious Mother* do not belong to general classes, but have bold, true, and individual features; and the language approaches that of the first age of the English drama. The *Douglas* of Home is not recommended by this species of merit. In diction and character it does not rise above other productions of the period. But the interest turns upon a passion which finds a response in every bosom; for those who are too old for love, and too young for ambition, are all alike awake to the warmth and purity of maternal and filial affection. The scene of the recognition of Douglas's birth possesses a power over the affections, which, when supported by adequate representation, is scarcely equalled in the circle of our drama. It is remarkable that the ingenious author was so partial to this theatrical situation, as to introduce it in several of his other tragedies.

Comedy of this period.

The comedy of the fourth period is chiefly remarkable for exhibiting *The Rivals* and the *School for Scandal*. Critics prefer the latter, whilst the general audience reap, perhaps, more pleasure from the former; the pleasantry being of a more general cast, the incident more complicated and varied, and the whole plot more interesting. In both these plays, the gentlemanlike ease of Farquhar is united with the wit of Congreve. Indeed, the wit of Sheridan, though equally brilliant with that of his celebrated predecessor, flows so easily, and is so happily elicited by the line of the dialogue, that, in admiring its sparkles, we never once observe the stroke of the flint which produces them. Wit and pleasantry seemed to be the natural atmosphere of this extraordinary man, whose history was at once so brilliant and so melancholy. Goldsmith was, perhaps, in relation to Sheridan what Vanburgh was to Congreve. His comedies turn on an extravagance of intrigue and disguise, and so far belong to the Spanish school. But the ease of his humorous dialogue, and the droll yet true conception of the characters, make sufficient amends for an occasional stretch in point of probability. If all who draw on the spectators for indulgence were equally prepared to compensate by a corresponding degree of pleasure, they would have little occasion to complain. The elder Colman's *Jealous Wife*, and some of his smaller pieces, are worthy, and it is no ordinary compliment, of being placed beside these masterpieces. We dare not rank Cumberland so high, although two or three of his numerous efforts retain possession of the stage. *The Wheel of Fortune* was certainly one of the best acting plays of its time, but it was perhaps chiefly on account of the admirable representative which the principal character found in Mr John Kemble.

The plays of Foote, the modern Aristophanes, who ventured, by his powers of mimicking the mind as well as the external habits, to bring living persons on the stage, belong to this period, and make a remarkable part of its dramatic history. But we need not dwell upon it. Foote was an unprincipled satirist; and while he affected to be the terror of vice and folly, was only anxious to extort forbearance-money from the timid, or to fill his theatre at the indiscriminate expense of friends and enemies, virtuous or vicious, who presented foibles capable of being turned into ridicule. It is a just punishment of this course of writing, that Foote's plays, though abounding in comic and humorous dialogue, have died with the parties whom he ridiculed. When they lost the zest of personality, their popularity, in spite of much intrinsic merit, fell into utter decay.

Meantime dramatic composition of the higher class seem-

ed declining. Garrick in our fathers' time, Mrs Siddons in ours, could neither of them extract from their literary admirers any spark of congenial fire. No part written for either of these astonishing performers has survived the transient popularity which their talents could give to almost any thing. The truth seems to be, that the French model had been wrought upon till it was altogether worn out; and a new impulse from some other quarter—a fresh turning up of the soil, and awakening of its latent energies by a new mode of culture—was become absolutely necessary to the renovation of our dramatic literature. England was destined to receive this impulse from Germany, where literature was in the first luxuriant glow of vegetation, with all its crop of flowers and weeds rushing up together. There was good and evil in the importation derived from this superabundant source. But the evil was of a nature so contrary to that which had long palsied our dramatic literature, that, like the hot poison mingling with the cold, it may in the issue bring us nearer to a state of health.

The drama receives a new impulse from Germany.

The affectation of Frederic II. of Prussia, and of other German princes, for a time suppressed the native literature, and borrowed their men of letters from France, as well as their hair-dressers,—their dramas as well as their dressed dishes. The continental courts, therefore, had no share in forming the national drama. To the highest circle in every nation that of France will be most acceptable, not only on account of its strict propriety and conformity to *les convenances*, but also as securing them against the risk of hearing bold and offensive truths uttered in the presence of the sovereign and the subject. But the bold, frank, cordial, and rough character of the German people at large did not relish the style of the French tragedies translated for their stage; and this cannot be wondered at, when the wide difference between the nations is considered.

The natural character of the Germans is diametrically opposite to that of the French. The latter are light almost to frivolity, quick in seeing points of ridicule, slowly awakened to those of feeling. The Germans are of an abstracted, grave, and somewhat heavy temper; less alive to the ridiculous, more easily moved by an appeal to the passions. That which moves a Frenchman to laughter, affects a German with sorrow or indignation; and in that which touches the German as a source of the sublime or pathetic, the quick-witted Frenchman sees only subject of laughter. In their theatres the Frenchman comes to judge, to exercise his critical faculties, and to apply the rules which he has learned, fundamentally or by rote, to the performance of the night. A German, on the contrary, expects to receive that violent excitation which is most pleasing to his imaginative and somewhat phlegmatic character. While the Frenchman judges of the form and shape of the play, the observance of the unities, and the denouement of the plot, the German demands the powerful contrast of character and passion—the sublime in tragedy and the grotesque in comedy. The former may be called the formalist of dramatic criticism, keeping his eye chiefly on its exterior shape and regular form; the latter is the fanatic, who, disregarding forms, requires a deep and powerful tone of passion and of sentiment, and is often content to surrender his feelings to inadequate motives.

General character of the German drama.

From the different temper of the nations, the merits and faults of their national theatres became diametrically opposed to each other. The French author is obliged to confine himself, as we have already observed, within the circle long since described by Aristotle. He must attend to all the decorum of the scene, and conform to every regulation, whether rational or arbitrary, which has been entailed on the stage since the days of Corneille. He must never so far yield to feeling as to lose sight of grace and dignity. He must never venture so far in quest of the sublime, as to run the risk of moving the risible faculties of an audience, so much alive to the ridiculous, that they will often find or make it in what is to others the source of the grand or the terrible. The Germans, on the contrary, have never subjected their poets to any arbitrary forms. The division of the empire into so many independent states has prevented the ascendency of any general system of criticism; and their national literature was not much cultivated, until the time when such authority had become generally unpopular. Lessing had attacked the whole French theatrical system in his *Dramaturgie* with the most bitter raillery. Schiller brought forward his splendid dramas of romance and of history. Goethe crowded the stage with the heroes of ancient German chivalry. No means of exciting emotion were condemned as irregular, providing emotion was actually excited. And there can be no doubt that the license thus given to the poet, the willingness with which the audience submitted to the most extravagant postulates on their part, left them at liberty to exert the full efforts of their genius.

Lessing, Schiller, and Goethe, became at once the fathers and the masters of the German theatre; and it must be objected to these great men, that, in the abundance of their dramatic talent, they sometimes forgot that their pieces, in order to be acted, must be adapted to the capabilities of a theatre; and thus wrote plays altogether incapable of being represented. Their writings, although affording many high examples of poetry and passion, are marked with faults which the exaggeration of their followers has often carried into total extravagance. The plays of chivalry and of history were followed by an inundation of imitations, in which, according to Schlegel, "there was nothing historical but the names and external circumstances; nothing chivalrous but the helmets, bucklers, and swords; and nothing of old German honesty but the supposed rudeness. The sentiments were as modern as they were vulgar; from chivalry pieces, they were converted into cavalry plays, which certainly deserve to be acted by horses rather than men." (Schlegel *on the Drama.*)

It is not the extravagance of the apparatus alone, but exaggeration of character and sentiment, which have been justly ascribed as faults to the German school. The authors appear to have introduced too harshly, brilliant lights and deep shadows; the tumid is too often substituted for the sublime; and faculties and dispositions the most opposed to each other are sometimes described as existing in the same person.

In German comedy the same faults predominate in a much greater degree. The pathetic comedy, which might be rather called domestic tragedy, became, unfortunately, very popular in Germany; and found a champion in Kotzebue, who carried its conquests over all the Continent. The most obvious fault of this species of composition is the demoralizing falsehood of the pictures which it offers to us. The vicious are frequently presented as objects less of censure than of sympathy; sometimes they are selected as objects of imitation and praise. There is an affectation of attributing noble and virtuous sentiments to the persons least qualified by habit or education to entertain them; and of describing the higher and better educated classes as uniformly deficient in those feelings of liberality, generosity, and honour, which may be considered as proper to their situation in life. This contrast may be true in particular instances, and being used sparingly, might afford a good moral lesson; but, in spite of truth and probability, it has been assumed, upon all occasions, by these authors, as the groundwork of a sort of intellectual jacobinism; consisting, as Mr Coleridge has well expres-

Drama.

ed it, "in the confusion and subversion of the natural order of things, their causes and their effects; in the excitement of surprise, by representing the qualities of liberality, refined feeling, and a nice sense of honour in persons and in classes of life where experience teaches us least to expect them; and in rewarding with all the sympathies that are the dues of virtue, those criminals whom law, reason, and religion, have excommunicated from our esteem."

The German taste was introduced upon the English theatre within these twenty years. But the better productions of her stage have never been made known to us; for, by some unfortunate chance, the wretched pieces of Kotzebue have found a readier acceptance or more willing translators, than the sublimity of Goethe, the romantic strength of Schiller, or the deep tragic pathos of Lessing. They have tended, however, wretched as the model is, to introduce on our stage a degree of sentiment, and awaken among the audience a strain of sensibility, to which we were previously strangers.

George Coleman's comedy of *John Bull* is by far the best effort of our late comic drama. The scenes of broad humour are executed in the best possible taste; and the whimsical, yet native characters, reflect the manners of real life. The sentimental parts, although one of them includes a finely wrought up scene of paternal distress, partake of the *falsetto* of German pathos. But the piece is both humorous and affecting; and we readily excuse its obvious imperfections, in consideration of its exciting our laughter and our tears.

Joanna Baillie.

Whilst the British stage received a new impulse from a country whose literature had hitherto scarce been known to exist, she was enriched by productions of the richest native genius. A retired female, thinking and writing in solitude, presented to her countrymen the means of regaining the true and manly tone of national tragedy. She has traced its foundation to that strong instinctive and sympathetic curiosity, which tempts men to look into the bosoms of their fellow-creatures, and to seek, in the distresses or emotions of others, the parallel of their own passions. She has built on the foundations which she laid bare, and illustrated her precepts by examples which will long be an honour to the age in which they were produced and admired, yet its disgrace, when it is considered that they have been barred their legitimate sphere of influence upon the public taste.

Maturin, Coleridge, and others.

Besides this gifted person, the names of Coleridge, of Maturin, and other men of talents, throng upon our recollection; and there is one who, to judge from the dramatic sketch he has given us in *Manfred*, must be considered as a match for Æschylus, even in his sublimest moods of horror. It is no part of our plan, however, to enter upon the criticism of our contemporaries.[1] Suffice it to say, that the age has no reason to apprehend any decay of dramatic talent.

Neither can our actors be supposed inadequate to the representation of such pieces of dramatic art as we judge our authors capable of producing. We have lost Mrs Siddons and John Kemble, but we still possess Kean, Young, and Miss O'Neil; and the stage has to boast other tragic performers of merit. In comedy perhaps it was never more strong. In point of scenery and decoration, our theatres are so amply provided, that they may rather seem to exceed than to fall short of what is required to form a classical exhibition.

Where then are we to look for that unfortunate counterbalance, which confessedly depresses the national drama, in despite of the advantages we have enumerated? We apprehend it will be found in the monopoly possessed by two large establishments, which, unhappily for the progress of national taste, and, it is said, without any equivalent advantage to the proprietors, now enjoy the exclusive privilege of dramatic representation. It must be distinctly understood, that we attribute these disadvantages to the *system* itself, and by no means charge them upon those who have the administration of either theatre. The proprietors have a right to enjoy what the law invests in them; and the managers have probably discharged their duty to the public as honourably as circumstances would admit of; but the system has led into errors which affect public taste, and even public morals. We shall briefly consider it as it influences, 1*st*, the mode of representation; 2*dly*, the theatrical authors and performers; and, 3*dly*, the quality and composition of the audience.

Drama.

Bad consequences of the monopoly possessed by the London theatres.

The *first* inconvenience arises from the great size of the theatres, which has rendered them unfit for the legitimate purposes of the drama. The persons of the performers are, in these huge circles, so much diminished, that nothing short of the mask and buskin could render them distinctly visible to the audience. Show and machinery have therefore usurped the place of tragic poetry; and the author is compelled to address himself to the eyes, not to the understanding or feelings, of the spectators. This is of itself a gross error. Every thing beyond correct costume and theatrical decorum is foreign to the legitimate purposes of the drama, as tending to divide the attention of the audience; and the rivalry of the scene-painter and the carpenter cannot be very flattering to any author or actor of genius. Besides, all attempts at decoration, beyond what the decorum of the piece requires, must end in paltry puppet-show exhibition. The talents of the scene-painter and mechanist cannot, owing to the very nature of the stage, make battles, sieges, &c. any thing but objects of ridicule. Thus we have enlarged our theatres, so as to destroy the effect of acting, without carrying to any perfection that of pantomime and dumb show.

Secondly, The monopoly of the two large theatres has operated unfavourably both upon theatrical writers and performers. The former have been in many instances, if not absolutely excluded from the scene, yet deterred from approaching it, in the same manner as men avoid attempting to pass through a narrow wicket, which is perpetually thronged by an importunate crowd. Allowing the managers of these two theatres, judging in the first and in the last resort, to be possessed of the full discrimination necessary to a task so difficult; supposing them to be at all times alike free from partiality and from prejudice; still the number of plays thrust upon their hands must prevent their doing equal justice to all, and must frequently deter a man of real talents, either from pride or modesty, from entering a competition clogged with delay, solicitation, and other circumstances, *haud subeunda ingenio suo*. It is unnecessary to add, that increasing the number of theatres, and diminishing their size, would naturally tend to excite a competition among the managers, whose interest it is to make experiments on the public taste; and that this would infallibly secure any piece of reasonable promise a fair opportunity of being represented. It is by such a competition that genius is discovered; it is thus that horticulturists raise whole beds of common flowers, for the chance of finding among them one of those rare varieties which are the boast of their art.

---

[1] This and other similar expressions, which now excite a melancholy interest, are suffered to remain, for the reason stated in the note, page 147.

The exclusive privilege of the regular London theatres is equally, or in a greater degree, detrimental to the performer; for it is with difficulty that he fights his way to a London engagement; and when once received, he is too often retained for the mere purpose of being laid aside, or *shelfed* as it is technically called; that is, rendered a weekly burden upon the pay-list of the theatre, without being produced above four or five times in the season to exhibit his talents. Into this system the managers are forced, from the necessity of their situation, which compels them to enlist in their service every performer who seems to possess buds of genius, although it ends in their being so crowded together that they have no room to blossom. In fact, many a man of talent thus brought from the active exercise of a profession, to be paid for remaining inactive in obscurity in London, and supported by what seems little short of eleemosynary bounty, either becomes careless of his business or disgusted with it; and, at any rate, stagnates in that mediocrity to which want of exercise alone will often condemn talent.

Thirdly, and especially, the magnitude of these theatres has occasioned them to be destined to company so scandalous, that persons not very nice in their taste of society must yet exclaim against the abuse as a national nuisance. We are aware of the impossibility of excluding a certain description of females from public places in a corrupt metropolis like London; but in theatres of moderate size, frequented by the better class, these unfortunate persons would feel themselves compelled to wear a mask at least of decency. In the present theatres of London, the best part of the house is openly and avowedly set off for their reception; and no part of it that is open to the public at large is free from their intrusion, or at least from the open display of the disgusting improprieties to which their neighbourhood gives rise. And these houses, raised at an immense expense, are so ingeniously misconstructed, that in the private boxes you see too little of the play, and in the public boxes greatly too much of a certain description of the company. No man of delicacy would wish the female part of his family to be exposed to such scenes; no man of sense would wish to put youth of the male sex in the way of such temptation. This evil, if not altogether arising from the large size of the theatres, has been so incalculably increased by it, that, unless in the case of strong attraction, prostitutes and their admirers usually form the principal part of the audience. We censure, and with justice, the corruption of morals in Paris. But in no public place in that metropolis is vice permitted to bear so open and audacious a front as in the theatres of London. Barefaced vice is never permitted to insult decency. Those who seek it must go to the haunts to which it is limited. In London, if we would enjoy our most classical public amusement, we are braved by her on the very threshold.

We notice these evils, without pretending to point out the remedy. If, however, it were possible so to arrange interests, that the patents of the present theatres should cover four, or even six, of smaller size, dedicated to the same purpose, we conceive that more good actors would be found, and more good plays written; and, as a necessary consequence, that good society would attend the theatre in sufficient numbers to enforce respect to decency. The access to the stage would be rendered easy to both authors and actors; and although this might give scope to some rant and false taste, it could not fail to call forth much excellence, that must otherwise remain latent or repressed. The theatres would be relieved of the heavy expense at present incurred, in paying performers who do not play; and in each maintaining three theatrical corps for the separate purposes of tragedy, comedy, and musical pieces; only one of which can be productive labourers on the same evening, though all must be supported and paid. According to our more thrifty plan, each of these companies would be earning at the same time the fruits of their professional industry. The hours of representation, in one or more of these theatres, might be rendered more convenient to those in high life, whilst the middling classes might enjoy a rational and classical entertainment after the business of the day.

Such an arrangement might indeed be objected to by those who entertain a holy horror of the very name of a theatre, and who imagine impiety and blasphemy are inseparable from the drama. We have no room left to argue with such persons, or we might endeavour to prove that the dramatic art is in itself as capable of being directed either to right or wrong purposes, as the art of printing. It is true, that even after a play has been formed upon the most virtuous model, the man who is engaged in the duties of religion will be better employed than he who is seated in a theatre, and listening to it. To those abstracted and enrapt spirits, who feel or suppose themselves capable of remaining constantly involved in heavenly thoughts, any sublunary amusement may justly seem frivolous. But the mass of mankind are not so framed. The Supreme Being, who claimed the seventh day as his own, allotted the other six days of the week for purposes merely human. When the necessity of daily labour is removed, and the call of social duty fulfilled, that of moderate and timely amusement claims its place, as a want inherent in our nature. To relieve this want, and fill up the mental vacancy, games are devised, books are written, music is composed, spectacles and plays are invented and exhibited. And if these last have a moral and virtuous tendency; if the sentiment expressed tend to rouse our love of what is noble, and our contempt of what is mean; if they unite hundreds in a sympathetic admiration of virtue, abhorrence of vice, or derision of folly; it will remain to be shown how far the spectator is more criminally engaged, than if he had passed the evening in the idle gossip of society, in the feverish pursuits of ambition, or in the unsated and insatiable struggle after gain—the graver employments of the present life, but equally unconnected with our existence hereafter. (W. S—TT.)

DRAMMEN, a seaport-town of Norway, stift of Aggerhuus, situated on both sides of the Drammen, near its mouth in the Christiania fiord, 24 miles S.W. of Christiania. It consists of three ports, Brognaes on the northern, and Stroemsoe and Tangen on the southern bank of the river. It is a place of extensive trade, and exports more timber (chiefly logs) than any other town in Norway. The chief manufactures are spirits, sailcloth, ropes, tobacco, leather, oil, and carriages. Pop. about 9000.

DRAN, Henri-François le, a celebrated French surgeon, born at Paris in 1685, was the son of a surgeon of the same name, who, while serving with the army, had been distinguished for practical dexterity in the treatment of gunshot wounds. Young Le Dran entered on the surgical career under the auspices and direction of his father, and early attained to eminence in his profession. He became surgeon-major and demonstrator of anatomy at La Charité, member of the royal academy of surgery, consulting surgeon of the camps and armies of the king, and associate of the Royal Society of London. Apart from his professional

Drawing.

pursuits, almost no particulars of his life have been preserved. He died at Paris on the 17th October 1770, at the advanced age of eighty-five. Le Dran was the author of a variety of works on surgery, of which we shall here subjoin a very brief account. 1. *Parallèle des différentes manières de tirer la Pierre hors de la Vessie*, Paris, 1730, 1740, 8vo, with plates; translated into German, Berlin, 1737, 8vo, and into English, London, 1738, 8vo. Le Dran, in this work, condemns the small, and shows himself a partizan of the large apparatus; recommending, however, that the incision should be made a little lower than Collot had been accustomed to make it, and that it should be of an extent sufficient to prevent the dilaceration of the bladder. He approves of the high operation only in the case where the bladder is sound and the calculus very voluminous. In order to obviate the too frequent lesion of the rectum in using the staff described by Albinus for the lateral operation of Rau, Le Dran invented a new staff, which enabled him to avoid such a casualty, and contributed materially to his success. 2. *Observations de Chirurgerie, auxquelles on a joint plusieurs Réflexions en faveur des Etudiants*, Paris, 1731, 2 vols. 12mo: translated into German, Nuremberg, 1738, 8vo, and into English, 1739, 8vo. This collection is rich in facts well chosen, and reported with candour and precision. The author does not dissemble his faults, and speaks of his success without ostentation. 3. *Traité des opérations de Chirurgerie*, Paris, 1731 and 1742, 8vo; London, 1749, 8vo, with additions by Cheselden. This work, in which the author ascribes an imaginary influence to the animal spirits, is nevertheless valuable, as containing an accurate description of a great number of operations, and many practical facts alike curious and interesting. If a new method is spoken of, he never fails to indicate the author of the discovery. 4. *Réflexions pratiques sur les plaies d'armes à feu*, Paris, 1737, 1740, 1759, 12mo; Amsterdam, 1745, 12mo: Nuremberg, in German, 1740, 8vo. To the excellent precepts of Ambroise Paré, the author has here added the fruits of his own experience; and he has contributed to check in some cases the use, then too exclusive, of the seton. He has also advocated the method of large incisions, and justly proscribed the application of sindons or pledgets of linen soaked with brandy, in the first dressing of gunshot wounds. 5. *Suite du Parallèle de la Taille*, Paris, 1756, 8vo. 6. *Consultations sur la plupart des Maladies qui sont du ressort de la Chirurgerie*, Paris, 1765, 8vo. 7. *Traité économique de l'Anatomie du corps humain*, Paris, 1768, 12mo. This work is full of superannuated hypotheses and material omissions. 8. *Récit d'une guérison singulière du plomb fondu dans la Vessie*, and *Lettre sur la dissolution du plomb dans cet organe*, Paris, 1749. Here Le Dran gives an account of his experiments for dissolving lead by means of mercury, and evinces great credulity in attributing to mercury certain imaginary qualities. Besides the works above enumerated, a great number of interesting observations by Le Dran may be found in the *Mémoires* of the Academy. (J. B—E.)

Drastic ‖ Drawing.

DRASTIC (δραστικός, from δράω, *to accomplish*), an epithet applied to medicines that are potent in operation; as a drastic cathartic.

DRAVE (German *Drau*), a river in the Austrian dominions, one of the principal affluents of the Danube. It rises on what is called the Toblachheath in the Pusterthal of Tyrol, not far from Innichen, and after a course of nearly 400 miles falls into the Danube some miles E. of Eszec. It flows at first E.N.E. to Linz, where it receives the Isel; thence its course is generally E.S.E. passing through Carinthia and Styria, and afterwards forming the boundary between Croatia and Sclavonia on the S. and Hungary on the N. The principal towns on its banks are Linz, Villach, Marburg, Pettau, and Fridau. Its principal affluents are, on the left, the Isel, Möll, Liser, Gurk, Lavant, and Mur; and on the right the Gail. Its course is rapid; and its bed, though rocky, is navigable for flat-bottomed boats to Villach.

DRAWBACK, in *Commerce*, a certain amount of duties or customs paid back or remitted to an importer of foreign goods on their exportation; or a certain amount of excise paid back or allowed on the exportation of some home manufactures. See COMMERCE.

DRAWING.

DRAWING is the art of representing forms upon a flat surface, by means of any sort of instruments, such as pencils, chalks, and the like. It is also a word used to denote the forms or contours of the figures in compositions, or in sculpture generally. Thus we say that the drawing in a picture, or the drawing of a statue, or any other figure, is of a high or an inferior kind, good or bad.

History.

This art is well known to be of the most remote antiquity, and it has been in use amongst the most barbarous and most civilized nations for a variety of purposes. The hieroglyphic figures, whether carved or painted, upon the ancient Egyptian obelisks and temples, the ornaments of the same description upon their buildings and sarcophagi, together with the like productions amongst the Mexicans, prove the ancient origin of the art. Some of the purest and best of the Egyptian sculptures, and particularly the figures of the harpers, described and illustrated by Bruce the traveller, exhibit a knowledge and correctness of taste in the art far surpassing what is usually admitted, and show that the Greek school in this, as well as in their other acquirements, was greatly indebted to the Egyptians for pointing out the road to that excellence of form and dignity of character and expression which their matchless works possess.

Greece and Rome.

Although examples of drawings by the Greeks have not come down to us, their magnificent statues assure us that their proficiency in the art must have been of the highest order; and certain expressions of Pliny, in describing their pictures, evidently indicate that the Greeks must have attained to the utmost excellence in drawing, at the period of their glory as a nation. It is not our intention to load this article with ancient historical information respecting the fine arts, otherwise many curious anecdotes might be introduced; but we cannot pass over the mention of Alexander's emotion on seeing a picture of Palamedes when betrayed by his friends, which forcibly reminded the hero of his own treatment of Aristonicus; nor can we refrain from noticing the picture of Agamemnon and Iphigenia by Timanthes, so highly extolled by Cicero, Quintilian, Valerius Maximus, and Pliny, as satisfactory proofs of the excellence of the ancients in drawing and painting, as well as in their sculptures and architecture. From the emotions which the higher excellencies of the pictures by the Greek artists produced in these gifted men, a fair inference may be drawn as to the perfection to which the art must have attained at the period of Grecian glory; and consequently drawing, even in the confined sense of the word, must have also been in a corresponding state of advancement. Their principal schools were at Sicyon, Rhodes, Athens, and Corinth; and when Greece was subdued by the Romans, the conquerors, alive to the benefits to be derived from the sciences and arts, encouraged the cultivation of them in their own capital, to which the

Greek artists resorted, and laid the foundation of the Roman school.

Revival of the fine arts.

From the conquests of Alaric and Attila in the fifth century, the arts lay prostrate and neglected, until their revival about the year 1450 at Florence, where Dominico Ghirlandaio, the master of Michel Angelo, practised painting with considerable reputation, which his pictures show he well merited.

Michel Angelo.

We have now arrived at the golden age of the arts amongst the moderns, for Michel Angelo must be admitted to have been the first to discover and practise them with the classical discernment and skill which ultimately led him to the highest eminence amongst his contemporaries as a painter, a sculptor, an architect, and engineer, and deservedly placed his reputation on a level with the greatest names of antiquity. Till his time painters were considered, as mere mechanics or labourers, and their employment was almost entirely confined to making representations of saints, and other figures used by the superstitious of the age. It was at this period, and surrounded by the wretched examples of such artists as Cimabue, Giotto, and others, that Michel Angelo, upon examining the torso of the Belvidere, instantly abandoned the barbarous taste and style of his master, and bounded into that sublime path which has been the admiration of all. "The poetry of the art," says Sir Joshua Reynolds, "he possessed in the most eminent degree; and the same daring spirit which first urged him to explore the unknown regions of the imagination, impelled him forward in his career beyond those limits which his followers, destitute of the same incentives, had not strength to pass. He was the bright luminary from whom painting has borrowed a new lustre, under whose hands it assumed a new appearance, and became another and superior art."

Raffaelle Santio.

Raffaelle Santio, the pupil of Pietro Perugino, was born on Good Friday in the year 1483, and died on Good Friday in the year 1520, so that he only lived thirty-seven years. He must be admitted to have surpassed all the moderns in drawing and painting, though his design does not possess those sublime conceptions to be found in the works of his rival Michel Angelo. Generally speaking, the choice of his subjects is simple and pleasing, for he cared not to grapple with those severe attitudes and expressions to be found in the works of his gifted contemporary; but his compositions are invariably correct and harmonious, and his drawing careful, elegant, and pure. It is to his school that we would recommend the student to look for those examples which will be of the greatest practical benefit to him in drawing; a circumstance which ought to be his first and principal aim.

It is not the proper place here to enter into the history of painting in Italy after its revival by the two great masters whose names and characteristic excellencies we have just mentioned. This we reserve for the article PAINTING; and we now proceed to explain the practical details of the management and manipulation of drawing in its various styles.

Drawing, as we have already stated, is that part of the art which represents the forms of objects upon a flat surface, and may be divided into outlining and shading; and as the chief attributes of almost all objects are embraced in the correctness of their forms, the student of art should labour with the utmost pains and assiduity in order to acquire severe accuracy in his outline, without which the most dexterous shading and finishing will be worse than thrown away.

In whatever department the genius of the student may lead him to practise, habits of correctness will be most successfully cultivated by drawing the human figure, the knowledge of which is the basis of all true excellence. The study ought to be begun by copying the most simple parts, such as we have exhibited in Plates CCVII., CCVIII., CCIX., CCX.; and the greatest anxiety to attain accuracy in the gentle undulations of form ought to be evinced. We would recommend that perspective should be studied at the earliest stage of the pupil's practice. By means of a knowledge of its rules, which are simple, much time will be spared to the student, and excellence more speedily acquired than when directed only by his eye in the practice of drawing, whatever the object may be.

Drawing in chalk.

Although it matters little what the instrument may be which is used in the practice of drawing, yet, upon the whole, we would recommend black and white chalks as the most to be preferred. They are easily procured, and convenient for use. They are usually fixed in an instrument of brass or steel, as represented below, the white chalk being placed at the one end, and the black at the other.

The paper should be slightly tinged with colour, so that the white chalk which is put upon the lights may tell properly. Crayon paper is the best. The outline being carefully made, first with charcoal as slightly as possible, and then corrected and smoothed with the black chalk, the shading may be executed as the taste of the student inclines. It may either be done with careful hatchings at particular angles, or in one solid smooth mass, or by a combination of both, which is probably the most advisable mode of practice. Too much attention to elaborate hatchings may divert the attention of the student from the more essential excellencies of the outline, and proper balance of light and shade; and a too careless manner in using his materials may lead to equal disadvantages, for in art, as in every thing else, carelessness in the beginning can never lead to excellence in the end. Much time in laying in the shadows may be spared by using an instrument called a stump, made of a piece of chamois leather rolled up in a cylindrical form, in a tight manner, tied round with thread, and shaped to a blunt point, as represented below.

A little chalk-powder may be dusted upon the shadow if extensive, and rubbed in with the instrument above described, and afterwards the part finished up with the chalk. The white chalk should not be used until the drawing is completed with the black, otherwise it is apt to get injured by admixture, which in no instance should be the case, for there ought always to be a space between the two chalks occupied by the tint of the paper.

The black chalk will be found to work very well upon white as well as coloured paper; but the process is more tedious, in consequence of all the middle or light tints having to be attended to and executed, which, in the case of the other paper, the tint produces. Errors in outline or shading may be rectified by rubbing out the defect with a piece of bread squeezed into a convenient shape between the finger and thumb.

After the student has acquired some degree of proficiency in using the chalk, and imitating any drawing or print which may be given him, he should next begin to copy from real substances, or what is technically termed drawing from "the round."

Here a wide field is opened up to him in the study of

Drawing.

the antique statues; and while striving to attain accuracy in copying these noble reliques of art, he should consider deeply their high character and expression. It is not to be expected that a very extensive set of examples of the antique, or a discussion and detail of their merits, can be given here; all that we can do is to lead the student to the proper source whence he may draw supplies; and with this view we would recommend him to peruse and contemplate the statues of the Apollo Belvidere, the Venus de' Medici, the Gladiator Borghese, the Torso of the Belvidere, and the matchless group of the Laocoon, at the time he is copying them in the way of practice. See Plates CCXI., CCXII., CCXIII., CCXIV., CCXV

Red chalk.

We have hitherto only considered the drawing of the human figure, and that in black and white chalks. Another very good way of producing a spirited effect is, by a union of both these with red chalk, a method much practised by the old masters in their academy figures, &c.

Measurement of the human figure.

The following are the measures of the human body, as taken by Fresnoy from the ancient statues. The ancients have commonly allowed eight heads to their figures, though some of them have allowed but seven. The figure is ordinarily divided into ten faces; that is to say, from the crown of the head to the sole of the foot, in the following manner:

From the crown of the head to the forehead is the third part of a face.

The face begins at the root of the lowest hairs which are upon the forehead, and ends at the bottom of the chin.

The face is divided into three proportionable parts, the first contains the forehead, the second the nose, and the third the mouth and the chin; from the chin to the pit betwixt the collar-bones is two lengths of a nose.

From the pit betwixt the collar-bones to the bottom of the breast one face.

From the bottom of the breast to the navel one face.

From the navel to the genitories one face.

From the genitories to the upper part of the knee two faces.

The knee contains half a face.

From the lower part of the knee to the ankle two faces.

From the ankle to the sole of the foot half a face.

A man, when his arms are stretched out, is from the longest finger of his right hand to the longest finger of his left, as broad as he is long.

From one side of the breast to the other, two faces.

The bone of the arm, called humerus, is the length of two faces from the shoulder to the elbow.

From the end of the elbow to the root of the little finger, the bone called cubitus, with part of the hand, contains two faces.

From the box of the shoulder-blade to the pit betwixt the collar-bones, one face.

If you would be satisfied in the measure of breadth from the extremity of one finger to the other, so that this breadth should be equal to the length of the body, you must observe that the boxes of the elbows with the humerus, and of the humerus with the shoulder-blade, bear the proportion of half a face when the arms are stretched out.

The sole of the foot is the sixth part of the figure.

The hand is the length of a face.

The thumb contains a nose.

The inside of the arm, where the muscle disappears which makes the breast (called the pectoral muscle), to the middle of the arm, four noses.

From the middle of the arm to the beginning of the head five noses.

The longest toe is a nose long.

The utmost parts of the teats and the pit betwixt the collar-bones of a woman make an equilateral triangle.

For the breadth of the limbs no precise measures can be given, because the measures themselves are changeable, according to the quality of the persons, and according to the movement of the muscles.

The best example of the measures of an ancient statue are by Audran, an author whom Sir Joshua Reynolds recommends as being the most useful; and on this department of our subject we now add the following table of the measurements and comparisons of the three celebrated statues of the Apollo, the Venus, and the Hercules, as published by Volpato and Morghen at Rome, in a work called *Il Principi del Disegno.* To preserve uniformity in the measurements, the head of each figure is divided into twelve parts, and each part into six minutes.

	Apollo.		Venus.		Hercules.	
	Parts.	Min.	Parts.	Min.	Parts.	Min.
From the beginning of the head to the root of the hairs	3	0	3	0	3	0
From the root of the hairs to the eyebrows, or beginning of the nose	3	0	3	0	3	0
From the eyebrows to the end of the nose	3	0	3	0	3	0
From the end of the nose to the bottom of the chin	3	0	3	0	3	0
From the chin to the articulation of the clavicle with the sternum	5	1	4	3½	6	0
From the clavicle to the end of the breast	9	3½	10	5	9	4
From the end of the breast to the middle of the umbilicus	10	5½	8	2	10	4
From the umbilicus to the symphysis pubis	7	4½	11	4½	8	2
From the symphysis pubis to the middle of the patella	24	0	18	2	23	3
From the middle of the patella to the beginning of the flank	28	2	27	3	30	1½
From the same to the swell of the foot	23	3½				
From the swell of the foot to the end of the figure, or to the ground	4	4				
From the patella to the ground			25	3		
From the patella to the end of the heel of the right leg					29	2½
The length of the sole of the foot	14	1½				
The highest part of the foot from the ground			3	5½	6	1½
From the instep to the end of the toes			9	0½	10	1½
From the clavicle or collar-bone to the beginning of the deltoid muscle	9	0	6	3		
The length of the whole clavicle on the right side					14	1
From the clavicle to the nipple	10	4½	6	0½	10	4
From one end of the breasts to the other	15	0	11	2	15	1½
The greatest breadth of the trunk, taken a little below the beginning of the thorax	18	3			22	4

	Apollo.		Venus.		Hercules.	
	Parts.	Min.	Parts.	Min.	Parts.	Min.
The breadth of the trunk from the end of the breast			15	4½		
The narrowest part of the same, taken at the beginning of the flank	15	3	15	1	19	3½
The greatest breadth of the ossa ilei, where the flanks project most	16	4	17	5	21	1½
From the highest part of the deltoid muscle to the end of the biceps	17	0½				
From the beginning of the os humeri to the cubit			20	2	22	1½
From the end of the biceps to the beginning of the hand	16	0	14	0	15	1½
The greatest breadth of the fore-arm in front	4	5	5	0	8	2
The greatest breadth of the arm in front	5	3	4	5	6	1
Breadth of the pulse of the arm in front					5	1
The greatest breadth from one trochanter to the other	17	5	19	3	22	0
The greatest breadth of the thigh in front	9	2½	9	5		
The greatest breadth of the left thigh					11	0½
The greatest breadth of the knee opposite the middle of the patella	5	3½	5	0	6	4
The greatest breadth of the calf of the leg	6	3½	6	3½	7	5½
The greatest breadth between the inner and outer ankle	4	0½	4	0	4	3
The narrowest part of the foot	3	3	3	3	3	5
The broadest part of the same	5	0	5	1	6	4½
From the last vertebra of the neck to the lower part of the os sacrum					38	4
From the end of the os sacrum to the end of the glutæus					6	4
From the end of the glutæus to the beginning of the gastrocnemius muscle					15	4
From the beginning of the gastrocnemius to the end of the figure					30	1

In the foregoing table, we by no means have set down the ancient formula as an infallible guide, since the changes which the human form undergoes from infancy to old age preclude the possibility of limiting its measurements to definite proportions, and much depends upon the order or rank of the figure to be represented. Thus the Apollo Belvidere and the Venus de' Medici have more than ten faces in their length; and in other respects these figures, which by their authors were intended to represent divinities, are considerably different in their proportions from others of the antique statues. It is enough if something approximating to accuracy of measurement be kept in view when the student is engaged in making his drawing; and this he should do without the use of compasses or any other mathematical means, which ultimately cramp his powers of imitation, and retard his progress towards perfection.

Light and shade, or chiar' oscuro.

Light and shade are the means by which the actual appearance of substance in the object represented is conveyed, and they should be studied with every attention, from the objects themselves which are assumed as the models for imitation. No rules can be laid down so good as the study of nature herself, and no language can explain the beauties of her varied appearances of lights, shadows, or reflections.

It is by means of light and shade also that the figures in a picture or composition are made to keep their proper places: thus the principal figure is generally illuminated with the strongest and broadest light, and the others kept subordinate. It is with considerable diffidence, however, that we state this as the practice most to be approved of: every artist, and indeed every school, has a peculiar mode of management in this, and we are aware that a different practice has often produced excellent results.

The general rule with regard to the relative proportions of light, shadow, and middle tint in a well-ordered effect is, that there should be rather more shadow than light, and more middle tint than either of the former, provided the subject does not require a different arrangement. In the infinite variety of forms of composition of the various schools, rules for the attainment of excellence can hardly be laid down with safety; and we must on this account refer the student to the contemplation of the works of the most esteemed masters, for examples to direct him in the practice of the chiar' oscuro of his pictures.

The study of anatomy is of the utmost importance towards a correct knowledge of the human figure, and is most beneficial in leading the way to an accurate representation of its various parts and attitudes. Without it no proper estimate can be formed of the movements of the joints of the limbs, nor of the swellings and undulations of the muscles, which, when in action, are constantly varying, and must be seized at the moment. It was by the careful study of this branch of science that Michel Angelo, Leonardo da Vinci, and other eminent artists, attained to such excellence in representing the forms when engaged in action, and displayed that accuracy of outline and show of energy which appear in the various members of their figures.

Drawing in Indian ink, sepia, bistre, &c.

The most necessary preparation for all drawings executed with Indian ink, sepia, bistre, or the like, is an accurate outline, which should be made with a black-lead pencil, or pen and ink if the work is only meant to be finished in a sketchy manner. Care must be taken in both to regulate the strength of the touch or line by the nearness or distance of the object represented. The shades should be laid in a good deal lighter at first than they are intended to be when the drawing is finished, and the hard edges of the touches softened with a water brush. The greater the attention paid to the subject as a whole in this stage, and the broader and less minute the washes are laid on, the better; for it is only as the drawing advances towards completion that the minutiæ should be attended to. In Pl. CCXVIII. we have given an example of the method of proceeding with a drawing washed in with one colour only. Fig. 1 exhibits the outline; fig. 2 the first broad wash; fig. 3 the second working; and fig. 4 the finished drawing. Each shading should be allowed to dry thoroughly before the succeeding wash is laid on; and there are many modes, we had almost said tricks, by which certain excellent effects are produced, which are only to be acquired by practice. Thus the use of a sharp pointed penknife will be found most serviceable in taking out irregularly-formed lights in the foreground; and much advantage will be found in wiping out lights and middle tints with a towel or handkerchief during the progress of the work; but regarding these no rules can be laid down. The artist must use his own discretion; though too much of such practice is not to be recommended.

The study of landscape ought to be commenced by imitating the most simple forms, as in the following figures.

Fig. 1.

Fig. 2.

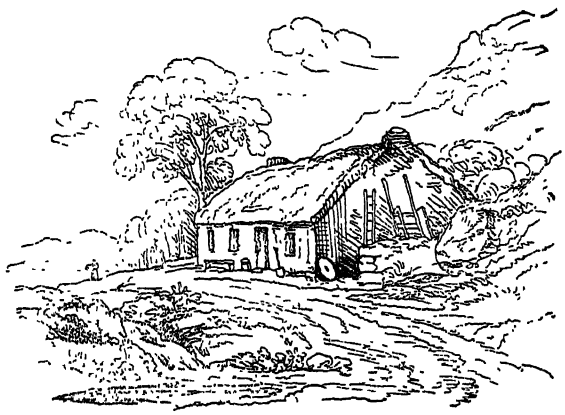

Fig. 3.

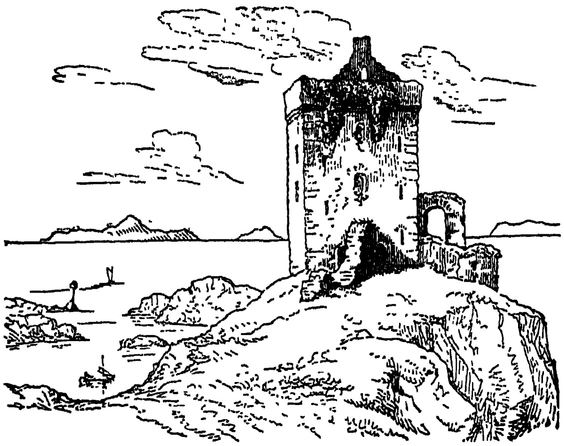

Fig. 4.

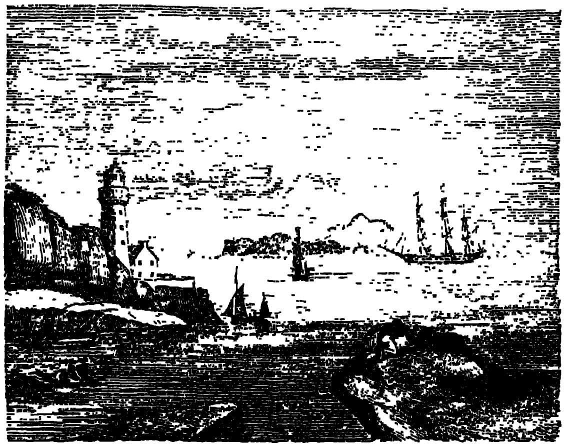

These or similar figures may be copied two or three times over before attempting such a work as we have given in Plate CCXVIII. Plate CCXVII. exhibits two examples of the style of sketching landscape by Claude; and we strongly recommend Turner's *Liber Studiorum* to the careful perusal of the young artist in this department. The studies of the human figure by Raffaelle, Parmegiano, and others, or their imitations by Rodgers, are the best. (Plate CCXVI.)

Drawing in water colours.

There is no branch of the art in which such a variety of means may be adopted for attaining the same end, namely, the imitation of nature, as in water-colour drawing; consequently we shall not attempt to lay down particular rules for the guidance of the student. Practice, as we have already stated, is the only means of arriving at the wished-for perfection; we shall therefore limit our notice to a few of the details most in use among painters in water colours.

The substances used in painting in water colours are to be had in all the shops in prepared or moist cakes, which are mixed with a little water on a stoneware pallet or plate.

Paper.

The paper upon which the drawing is to be made may be either smooth or rough; and if greasy on the surface, so that the colours do not adhere pleasantly, it may be sponged over, or the colours may be mixed with a little ox-gall,

Ox gall.

either in its native or prepared state. One drop of gall in the former condition, or the size of a large pin head in the latter, will be enough to saturate a tea-cupful of water for the purpose of mixing with or softening off the colours.

Colours.

The paints chiefly used are ultra-marine blue, indigo, Antwerp and cobalt blues, gamboge, ochre, Indian, and crome yellows, Indian red, vermilion, lake, carmine, burnt ochre, and brown pink reds; and although these may be denominated the primaries out of which all other modifications of tints can be made up, yet we may add to them a number of browns which will be found to be serviceable, such as terra di sienna, both raw and burnt, Vandyke brown, umber, sepia, &c.

Pasting the paper on the board or frame.

The paper ought to be stretched upon a drawing board or frame, which is effected by soaking it in water, or by sponging it over on both sides, then removing the superabundant water with a piece of blotting paper or towel, and afterwards folding back the edge for about an inch all round, and applying the paste to the folded portion, and also to that part of the drawing board which the paper is to adhere to. The part so pasted should be pressed strongly, or the finger may be dipped into the paste and rubbed upon the pasted edge, and then the paper sponged all over, that the pasted edge may be permitted to dry more quickly than the centre part. Care must be taken not to let any of the paste touch the middle of the paper, which would destroy the drawing when cut from the board.

Whatever may be the subject, it will be advisable to begin with light colour, and gradually work up both effect of light and shadow, and strength of tint, in a broad manner, without much attention to minutiæ, as already described in Indian ink drawing. The earlier water-colour painters were in the practice of working with a gray or neutral tint at the commencement of their drawings; and as this method is very simple, it will be the best for beginners, though in the end there will not be produced that richness of effect, and freshness, depth, and warmth of colour, which is the result of the contrary practice of the best masters of the present day; we mean the laying on of the colours almost at once, without any under preparation of neutral tint. In landscape painting, the paper where the

Sky.

sky is represented ought to be well soaked with water from a sponge, and afterwards dried moderately with a towel or piece of bibulous paper, to make the tints lie on

more solidly. The tints are then to be blended into each other while the surface is damp, and this should be done with large brushes. After the sky and distance are laid in, the middle and foregrounds should be added, in all cases keeping the brushes well filled with colour, and the details worked out as the taste or ability of the artist may lead him, for it is impossible to prescribe rules where no two artists follow the same practice.

Fore-ground.

Ultra-marine.

The appearance of air may be given to the distance by washes of blues or neutral tints; and the spaces where sharp distinct lights are situated may be scraped out with a pen-knife, or the touches may be laid in with clean water, and after being allowed to remain upon the paper for a minute or less, they may be rubbed out with a piece of stale bread. Another mode of leaving out the lights is to touch the places with pipe-clay, used in a liquid state, with a camel's-hair pencil, and afterwards the colour may be freely laid over them; the parts where the clay is laid have then only to be rubbed with bread or Indian rubber, to remove the tint, and expose the clean paper. Should any error, either in outline or effect of chiar' oscuro, have been committed, the whole space can be removed with a sponge and water, without much injury to the paper; indeed many of the best artists of the present day rub out and lay in their colours almost alternately, by which means a very great variety of surface and tint is obtained which could not be effected by any other process.

Removing of errors.

We have thus endeavoured to give what we hope will be found a satisfactory account of practical drawing, whether in chalk or water colour; and it now remains for us to recommend, for the student's careful perusal, Leonardo da Vinci *on Painting;* the works of Sir Joshua Reynolds; Burnet *on Light and Shadow in Painting, on Colour in Painting, on Composition in Painting;* the works of the old masters, whether their drawings or etchings; and, above all, the study of nature. Every one who has long been in the habit of copying from drawings alone, of whatever description, must have felt considerable diffidence in attempting to draw from real objects or from nature. This arises from the fear of being unable properly to reduce and hold in their relative place, on a sheet of paper, the objects which present themselves to the eye. To remove this obstacle, we would recommend that too much should not be attempted at the first, but the most simple subjects chosen, and these represented in a careful manner; the outline on the light side of the objects to be done in a delicate manner, and that on the shadow side in a bold style, and the shading to be also conducting upon similar principles. The most careful attention to representing the various forms should be practised in the outline, for on the accuracy of it depends the balance or fitness of the whole design or picture. By thus habituating the eye to a correct delineation of the parts, it has little difficulty in coming at the power of representing the general effect and appearance of the whole; and thus a picture, whether consisting of figures, rocks, trees, or marine objects, is managed with comparative ease; while, on the other hand, when a design has been commenced without due attention to the outline and balance of the objects, a loose and disjointed performance is produced.

Drawing from nature.

Many other difficulties present themselves at first to the anxious student, and not the most unimportant is the feeling which seizes him upon the contemplation of works of excellence when seen in a finished form; but let him not despond, for much pains have been used, and great and palpable errors committed, even by the most accomplished masters, in the details of their works, which, the more accurate they are, the greater has been the difficulty encountered. As an illustration of this, we have thought it proper to direct attention to the variety of lines used to represent the objects of Plate XIV., taken from a sketch by Raffaelle. The subject is the study for a portion of the picture of the School of Athens, and contains much valuable information to the learner respecting the progress of this great master in the management of his compositions, of one of the most important of which this is the first rough sketch.

Description of the Plates.

Plate V. Initiatory lessons for drawing the various parts of the face. Figs. 1, 2, 3, represent the human eye in a variety of positions. Figs. 4 and 5, the nose. Figs. 6, 7, 8, the nose and mouth.

Plate VI. Second lesson. Figs. 1 and 2, the ear. Figs. 3, 4, 5, studies of heads.

Plate VII. Plate of male and female hands in a variety of positions as represented in figures 1 to 11.

Plate VIII. contains eight figures or studies of the human foot.

Plate IX. Studies from the antique. Fig. 1, Thalia; fig. 2, Clio; both examples of sitting figures. Fig. 3, Bacchus. Fig. 4, Venus of Arles. Fig. 5, a Discobolus.

Plate X. Studies from the antique. Fig. 1, Hercules and Telephus. Fig. 2, the Torso of Michel Angelo. Fig. 3, Jason. Fig. 4, the Dying Gladiator.

Plate XI. Studies from the antique. Fig. 1, Venus de Medicis Fig. 2, Venus of the Capitol.

Plate XII. Study from the antique. Fig. 1, the Apollo Belvidere.

Plate XIII. Study from the antique. Fig. 1, Group of the Laocoon.

Plate XIV. Specimen of sketching by Raffaelle.

Plate XV. Specimens of sketching by Claude Lorraine.

Plate XVI. Example of the mode of conducting a drawing in Indian ink, bistre, sepia, &c., from outline to finished performance. (W. H. L.)

DRAY (Lat. *traha, a sledge*), a kind of cart used by brewers for carrying barrels of beer or ale: also a sledge.

DRAYTON, MICHAEL, a celebrated English poet, was born at Harshull in Warwick in 1563. The events of Drayton's life are involved in great obscurity. It is believed that he went to Oxford, which he quitted without taking his degree, and that he afterwards entered the army. In 1593 he published his first work, under the title of *The Shepherd's Garland*, a collection of pastoral poems, in a style which was then becoming highly popular in England. As a whole, this work was utterly unworthy of its author's powers, and it is now almost entirely forgotten, with the exception of the ballad of *Dowsabel*, which Percy incorporated in his *Reliques*. The *Shepherd's Garland* was reprinted in 1619, under the title of *Eclogues*. To the historical poetry of his era Drayton made two valuable contributions in his *Barons' Wars*, and *England's Heroical Epistles*, works in themselves highly interesting, and in many passages both touching and imaginative, though neither of them exhibits a just conception of the poet's privilege of idealizing the actual. Drayton's fame as a poet, however, rests on his *Polyolbion*, the greatest of his works. The general outline of this composition is descriptive, though it partakes largely of the nature of didactic, historical, and pastoral poetry. The thinly disguised design of the author is to furnish a topographical description of England; a purpose so dangerously prosaic, that his greatest work, though redeemed by many passages of fine fancy and sentiment, as well as splendid diction, has hardly ever perhaps been read through from beginning to end. The immense length of the poem, as well as its occasional obscurity and cumbrousness, have likewise greatly interfered with its popularity. The measure which Drayton adopted for the *Polyolbion* is the Alexandrine, which has rarely been managed with greater skill. The *Barons' Wars* again are written in the *Ottava rima*. Drayton's little fairy tale, entitled *Nymphidia*, is a composition which, in its peculiar vein, has never been surpassed.

After the publication of the *Polyolbion*, the only event

of importance in the life of Drayton was his appointment to the office of poet laureate. He died in 1631, and his tomb may still be seen in the Poet's Corner of Westminster Abbey.

DREAMS are those thoughts which pass through the mind, and those imaginary transactions in which we often fancy ourselves engaged, when in the state of sleep. Of all the subjects upon which the mind of man has speculated, there is perhaps none which has more perplexed philosophers than that of dreaming.

In regard to the immediate cause of dreaming, the opinions of the ancients were very various. Aristotle observes —Every object of sense produces upon the human soul a certain impression, which remains for some time after the object that made it is removed; and which, being afterwards recognised by the perceptive faculty in sleep, gives rise to the varied images which present themselves.

Amongst English writers on this subject, none have written with more acuteness in support of his theory than Baxter. He supposes that our dreams are prompted by *separate spirits*—an opinion generally entertained by the heathen, and which opinion has given rise, in all ages and in all countries, to endless superstition and imposture—(*Essay on the Phenomenon of Dreaming*, vol. ii., 3d edit., 1745).

Professor Dugald Stewart, in endeavouring to reduce the phenomenon of dreaming to *some established principles*, remarks, that in sleep those operations of the mind are suspended which depend on our *volition*. He then says that, if the suspension of our voluntary operations in sleep be admitted as a fact, there are only two suppositions which can be advanced concerning its cause;—the one is, that the power of volition is suspended; the other, that the will loses its influence over those faculties of the mind and those members of the body which, during our waking hours, are subjected to its authority. Now it may be shown that the former is not consistent with fact, whence the latter follows as a necessary consequence. Hence it is inferred that all our mental operations which are independent of our *will* may continue during sleep; and that the phenomenon of dreaming may, perhaps, be produced by these, diversified in their apparent effects in consequence of the suspension of our voluntary powers. Two obvious consequences follow:—1st, That when we are asleep, the succession of our thoughts, in so far as it depends on the association, may be carried on by the operation of the same unknown causes by which it is produced while we are awake; and, 2d, That the order of our thoughts in these two states of our minds must be very different, inasmuch as in the one it depends solely on the laws of association, and in the other on those laws combined with our own voluntary exertions.

If, then, the succession of our thoughts during sleep is regulated by the same general laws of association to which it is subjected while we are awake, and if the circumstances which discriminate dreaming from our waking thoughts are such as must necessarily arise from the suspension of the *will*, this may account for the inaccurate estimate we form of *time* when dreaming: the rapidity of thought is such that in the twinkling of an eye a crowd of ideas may pass before us, to which it would take a long discourse to give utterance; and transactions may be conceived which it would require days, or even years, to realize. But in sleep the conceptions of the mind are mistaken for realities, and therefore our estimate of time will be found not according to our experience of the rapidity of thought, but according to our experience of the time requisite for realizing what we conçeive.—(Stewart's *Elements of the Philosophy of the Human Mind*, pp. 328–348.)

There seems a strong analogy between dreaming and insanity. Dr Abercrombie defines the difference between the two states to be, that in the latter the erroneous impression, being permanent, affects the conduct; whereas, in dreaming, no influence on the conduct is produced, because the vision is dissipated on awaking.

Dreams appear to be ordinarily the re-embodiment of thoughts which have before, in some shape or other, occupied the mind. They are broken fragments of our former conceptions revived, and heterogeneously brought together. If they break off from their connecting chain, and become loosely associated, they exhibit ofttimes absurd combinations, but the *elements still subsist*. If, for instance, any irritation, such as pain, fever, &c., should excite the *perceptive* organs while the reflective ones are under the influence of sleep, we have a consciousness of objects, colours, or sounds being presented to us, just as if the former organs were actually stimulated by having such impressions communicated to them by the external senses; whilst, in consequence of the repose of the reflecting power, we are unable to rectify the illusion, and conceive that the scenes passing before us, or the sounds that we hear, have a real existence. This want of mutual co-operation between the different faculties of the mind may account for the *disjointed* character of dreams. This position might be fully substantiated by an appeal to the evidence of fact. Dr Beattie speaks of a man who could be made to dream anything by whispering in his ear. Dr Gregory relates of himself that, having once had occasion to apply a bottle of hot water to his own feet when he retired to bed, he dreamed that he was ascending the side of Mount Ætna, and that he found the heat of the ground almost insufferable. Persons who have had a blister applied to their head have been known to dream of being scalped by a party of North American Indians. Sleeping in a smoky room, we may dream of a house or a city being in flames. The smell of a flower applied to the nostrils may call forth the idea of walking in a garden; and the sound of a flute may excite in us the most pleasurable associations.

The only one of our mental powers which is not diminished while dreaming is fancy, or imagination. We often find *memory* and *judgment* alternately suspended and exercised. Sometimes we fancy ourselves contemporaneous with persons who have lived ages before: here memory is at work, but judgment is set aside. We dream of carrying on a very connected discourse with a deceased friend, and are not conscious that he is no more: here judgment is awake, but memory suspended.

How God revealed himself by dreams, and raised up persons to interpret them, the Scriptures abundantly testify. That divine dreams, which actually were imparted to God's servants, should be imitated in fictitious representation by ancient and modern writers, was consistent no less with the general objects of superstition and imposture than with those of literature. Hence divine dreams became the constant appendages of the heathen mythology, and accounts, real and fictitious, of communications in vision, were interwoven in every production. Information which was superior to the vulgar philosophy of the time, intimated its discoveries as suggestions imparted by *inspiration*. If a warning was to be conveyed, what so affecting as the admonition of a departed friend! Such machinery was particularly adapted to works of imagination; and the poems of antiquity, as well as those of modern times, were frequently decorated with its ornaments.

DREDGING. See NAVIGATION, *Inland*.

DRELINCOURT, CHARLES, an eminent Calvinistic divine, was born in July 1595 at Sédan, where his father was register to the supreme council. After officiating for some time as Protestant pastor at Langres, he removed in 1620 to Paris, where he was settled in the church of Charenton. He is best known in England by his *Catechism* and *Consolations against the Fears of Death*, works which have been translated and frequently reprinted. His controversial works, which are directed chiefly against the claims of the Papacy, are numerous, and include the *Ju-*

bilee, the *Roman Combat*, the *Jesuit's Owl*, an *Answer to Father Coussin*, *Disputes with the Bishop of Bellai*, an *Answer to Lamilletière*, *Dialogues against the Missionaries*, the *False Pastor convicted*, the *False Face of Antiquity*, the *Pretended Nullities of the Reformation*, an *Answer to Prince Ernest of Hesse*, an *Answer to the Speech of the Archbishop of Sens*, *Defence of Calvin*, the *Abridgment of Controversies*, and other works. He married the daughter of a rich merchant at Paris, by whom he had sixteen children. His third son, professor of physic at Leyden, was physician to the prince and princess of Orange before their accession to the crown of England. Drelincourt died in November 1660.

DRENTHE, a province of Holland, bounded on the N. and N.E. by Groningen, E. and S.E. by Hanover, S. by Overyssel, and W. by Friesland. Area 1028 square miles. Pop. (1853) 87,944. The soil is generally poor, a great part of it being heaths and marshes; and in fact little more than one-half of the entire province is capable of cultivation. The capital is Assen, with about 4500 inhabitants.

DRESDEN, the capital of the kingdom of Saxony, and one of the finest cities of Europe, is situated on both sides of the Elbe, at an altitude of 402 feet above the level of the sea, 72 miles E.S.E. of Leipzig, and 100 S.S.E. of Berlin. Lat. 51. 2. 54. N., Long. 13. 44. 47. E. It occupies the most beautiful and highly cultivated portion of the valley of the Elbe, and is approached on almost every side through avenues of trees, while the distance is bounded by gentle eminences covered with plantations and vineyards. Its delightful situation, and the numerous objects of interest which it contains, have not undeservedly acquired for it the designation of the "German Florence." The city itself, however, when examined in detail, will in some measure disappoint the anticipations formed of it when seen from a distance, there being a want of fine streets and imposing public buildings. On the left bank of the Elbe stand the Altstadt or old town, Friedrichstadt, and several suburbs which constitute the larger portion of the city, while on the opposite bank is the Neustadt or new town. The Weisseritz, a small affluent of the Elbe, separates Friedrichstadt from the Altstadt. The streets of the Altstadt are narrow and the houses lofty, which give to this part of the town a gloomy appearance; in the Neustadt the streets are wide and regular, and the houses well built. The Elbe is here crossed by two bridges, the one an elegant stone bridge of sixteen arches, 1380 feet in length and 42 in breadth: the other, forming a portion of the line of railway leading from Leipzig through Dresden to Prague, is a still finer bridge, 1420 feet in length, 54 feet wide, and 40 feet above the river, having, besides two lines of railway, a carriage way and two foot ways. The Altstadt was formerly surrounded with fortifications, but these were demolished by the French in 1810, and the space occupied by them has been appropriated to gardens and promenades. The Royal Palace is an irregular antique building, having externally the appearance of a fortress rather than of a royal residence; but the interior is richly decorated, and in every way worthy of its destination. It contains the proposition-saal in which the sessions of the legislature are opened, the royal library, the hall of audience with a splendid ceiling painted by Sylvester, the parade chamber with paintings by the same master, the royal audience chamber, the chamber of ceremonies, and the porcelain cabinet, the walls of which are ornamented with porcelain. Opening upon the palace-yard is the celebrated Green Vault (Grüne Gewölbe), so called probably from the colour of the hangings with which the chambers were originally decorated, and containing an immense collection of precious stones, pearls, and works of art in gold, silver, amber, and ivory. These are arranged in eight apartments, each exceeding the previous one in the splendour and richness of its contents, and are estimated at above a million sterling in value. Near the palace, and communicating with it, is the celebrated gallery of paintings, the finest collection north of the Alps, containing numerous specimens of the Italian, French, Flemish, Dutch, German, and modern schools, including Raphael's Madonna di San Sisto, six paintings by Correggio, several by Titian, Paul Veronese, Caracci, Guido, Rubens, Vandyck, Teniers, Holbein the younger, Rembrandt, Claude, &c. Beneath the picture gallery is a fine collection of plaster casts of the most famous antique statues, made under the superintendence of the celebrated artist Raphael Mengs. A new picture gallery has been in progress since 1846, and will be opened in 1854-55. The Zwinger, a fine group of buildings surrounding an inclosure planted with orange trees, was erected in 1711, and originally intended to form the vestibule to a new palace designed by Augustus II. It contains the historical museum, museum of natural history, and cabinet of prints and drawings. The S.E. angle was burned down during the revolt of May 1849, and still remains a ruin. The historical museum, formerly the armoury, is undoubtedly one of the finest collections of the kind in Europe. Though less interesting as a historical collection than the Ambras collection at Vienna, it yet surpasses that one in armour of rich and elaborate workmanship. The museum of natural history, though inferior to many of the kind on the Continent, still contains many objects of interest to the scientific. The cabinet of engravings is one of the most complete collections of copperplates in Europe, containing everything interesting in the history of the art, or valuable from practical excellence. It contains in all about 300,000 engravings, arranged in classes. The Palace of the Princes contains a handsome chapel, a gallery of portraits of princes of the Saxon and Bavarian lines, a porcelain cabinet, a library of 10,000 volumes, and a cabinet of engravings. A covered way leads from this palace to the opera-house, which is capable of accommodating 8000 spectators. The new theatre, near the Catholic church, is one of the handsomest in Germany, and is capable of containing 1700 persons. The Bruhl Terrace, extending along the left bank of the Elbe, is approached from the foot of the old bridge by a grand flight of broad steps. It commands an extensive view of the surrounding scenery, and is a favourite resort of the inhabitants. Contiguous to it is the Bruhl Palace, in which are the academy of fine arts, and a collection of 50 landscapes by Canaletto. The Japanese Palace in the Neustadt, so named from some grotesque oriental figures and ornaments with which it is decorated, was built by Augustus II. for a summer residence, and hence is sometimes called the Augusteum. It is now appropriated to public purposes, and the beautiful pleasure grounds which surround it form a most agreeable promenade for the citizens. It contains the museum of antiquities and modern statuary, occupying ten saloons, and enriched with some of the finest antique statues in Germany, a cabinet of coins, a public library containing about 300,000 volumes, 2800 MSS., and a very large collection of maps, besides the celebrated porcelain cabinet, containing more than 60,000 pieces of china. The Court Roman Catholic church, built in 1739-56, is a large edifice in the Italian style. Externally it is profusely decorated, and by many considered deficient in taste; but internally it is chaste, elegant, and imposing, and altogether is one of the finest in Germany. It contains paintings by Rubens and Mengs, and a fine organ by Silbermann, and is surmounted by a steeple 378 feet in height. The church of Our Lady is also a magnificent building, with a cupola 320 feet in height, resembling that of St Peter's at Rome, and contains a fine organ of 6000 pipes. The Cross Church, Sophia Church, and the synagogue are also elegant buildings. Among the other public edifices may be noticed the mint, arsenal, medical and surgical school, house of assembly, royal guard house, new general

post-office, town-hall, trades'-hall, Maximilian's Palace, and cavalry and infantry barracks. Dresden has a great number of literary and scientific institutions, including a botanic garden, observatory, schools of medicine, surgery, and veterinary science, academy of arts, two colleges, a high school, &c. There are also numerous charitable institutions, as asylums, hospitals, &c., and excellent public baths. The celebrated Dresden china is not made here, but at Meissen, about 14 miles distant. In 1849 the population of Dresden amounted to 94,092, of whom 88,181 were Lutherans, 553 Reformed, 4411 Roman Catholics, and 672 Jews; 167 were blind, 110 deaf and dumb, and 128 insane. In 1852 the population was 104,500: during that year the deaths were 3340, and the births 3916: of the latter 1446 were illegitimate.

DREUX (the *Durocassæ*, or *Durocasinum-Castrum*, of the Romans), the chef-lieu of an arrondissement in the department of Eure-et-Loir. The town lies at the foot of a hill crowned by the ruins of the old castle of the counts of Dreux. In the middle of these ruins Louis-Philippe erected a chapel with splendid vaults as a burying-place for the members of his family.

The antiquity of Dreux is considerable. In 1188 it was taken and burnt by the English; and at the close of the sixteenth century it formed the scene of a bloody battle between the Catholics and Calvinists. In 1593 the town was taken by Henry IV., after an obstinate siege of eighteen days. The walls were razed, and Dreux thenceforth entirely lost its political importance. Dreux contains tribunals of first instance and of commerce, and a communal college. Pop. (1852) 6250.

DREVET, Pierre, the younger, an eminent French engraver, was born in 1697, at Paris, where his father had acquired considerable reputation in the same department of art. He was a member of the royal academy of painting and sculpture, and died at Paris in 1739, at the age of forty-two. In his portraits, which are highly elaborate, he particularly excelled in representing lace, silk, fur, velvet, and other ornamental parts of dress. Of his historical prints—which, in point of neatness and exquisite workmanship, are scarcely to be equalled—the most esteemed is the Presentation of Christ in the Temple; a very large plate, lengthwise, from Luigi de Bologna. This print is very valuable, but the first impressions of it are rarely to be met with. Among his portraits, the best are those of Bossuet and of Samuel Bernard. The first impressions of the latter are before the words *Conseiller d'Etat* were inserted upon the plate.

DRIFFIELD, Great, a market-town and seat of a poor-law union, in the east riding of Yorkshire, 28 miles E. by N. from York, and 196 N. by W. from London by road. The town—which consists of one principal street, from which some smaller ones diverge—is agreeably situated at the foot of the Wolds, and is connected with the port of Hull by a navigable canal. It stands in the centre of a fertile district, the inhabitants of which are chiefly engaged in agriculture; and an important market is held in the town every Thursday, in which extensive transactions take place in corn and cattle. The principal public buildings in Great Driffield are the corn exchange, the dispensary, the mechanics' institution, and the station of the Hull and Scarborough railway. Besides the parish church, it contains places of worship for Independents, Methodists, and Baptists; and also national and infant schools. In the town is a manufactory of chemical manure, while in the neighbourhood are numerous flour-mills, and mills for bone-crushing. The living of Great Driffield is a vicarage, with the perpetual curacy of Little Driffield attached, in the archdeaconry of the east riding, and diocese of York. Pop. (1851) 3792.

DRIFT, in *Navigation*, the angle which the line of a ship's motion makes with the nearest meridian, when she drives with her side to the wind and waves, and is not governed by the helm. It also implies the distance which the ship drives on that line.

Drift, in *Mining*, a passage cut between shaft and shaft; or a way wrought under the earth.

Drift-*Sail*, a sail used under water, veered out right a-head by sheets, as other sails are. It serves to keep the ship's head right upon the sea in a storm, and to prevent her driving too fast in a current.

Drift-*Wood*, trees or timber carried out to sea by rivers when in flood; timber drifted or floated by water.

DRILL (Sax. *thirlian*, to *perforate;* Ger. *drillen*, to *turn*, to *twist*), a tool with a steel point, used for perforating metal, ivory, and other hard substances. It is worked by a moderate pressure, with a whirling motion, which is usually communicated to it either by a *drill-bow*, or by means of a nut made to play on a spiral shaft in the end of which the steel point is fixed. The extremity of the borer is generally somewhat flattened, and of an angular shape, thus ⌣, with sharp edges.

Drill, in *Agriculture*, a machine for sowing seeds in regular rows. See Agriculture, vol. ii., p. 274.

DRILLING, the training or exercising of soldiers.

DRINK. See Dietetics.

DRIPSTONE, or Label. See index to Architecture.

DRIVING, in *Metallurgy*, is said of silver, when, in the operation of refining, after the lead is burnt away, the remaining copper rises upon its surface in red fiery bubbles.

Driving, in sea language, is said of a ship when her anchor fails to hold her fast, and she floats away with the wind or tide. A vessel is also said to drive when she scuds before a gale.

DROGHEDA, a town in the province of Leinster, in Ireland, situated in the middle of a small district called the county of the town of Drogheda, between the counties of Louth and Meath, is built on both sides of the river Boyne, about 4 miles from its mouth, and 31½ miles north of the city of Dublin. The entire extent of the county is 9 square miles, or 5780 acres. In the earliest notices of it by ancient writers it is called Inver-Colpa, or the Port of Colpa, and afterwards Tredagh. Drogheda, the name it is at present known by, signifies "the Bridge over the Ford." The portions on each side of the Boyne were formerly distinct towns, under separate jurisdictions, distinguished by the names of Drogheda on the side of Meath, and Drogheda on the side of Uriel, the ancient appellation given to the county of Louth and some adjoining districts. Drogheda is now divided into the parishes of St Peter, St Mary, and part of that of Ballymakenny; and contained, in 1831, a population of 17,365; in 1841, of 17,300; and in 1851, of 16,845.

Formerly the municipal government of the town was vested in the mayor, two sheriffs, two justices of the peace, and a recorder, to whom a charter had been granted under the following circumstances: Whilst the town was split into two jurisdictions, the inhabitants were incessantly in a state of mutual hostility, in consequence of trading vessels landing their cargoes in the southern town, to avoid the payment of pontage duty levied on all vessels discharging on the northern or Louth side. Much blood was frequently shed on these occasions. At length Philip Bennett, a monk residing in the town, took occasion, on the festival of Corpus Christi, to preach a sermon before the constituted authorities of both sides, in which he inculcated the blessings of union so emphatically, and followed up the subject so effectively at an entertainment to which he invited them in his convent the same day, that they all joined in sending a deputation to Henry IV. to obtain a new charter, by which both parts were embodied into a single corporation. This event took place in the year 1412. The charter was afterwards confirmed with alterations by James I. The mayor was honoured by Edward IV. with a sword of state, and L.20 a-year for

Drogheda.

its maintenance, in reward of the services performed by the townsmen in an engagement at Malpas Bridge, where this magistrate, at the head of 500 archers and 200 pole-axemen, contributed to the defeat of O'Reilly and his confederates. Previously to the union Drogheda returned two members to parliament. The number has since been reduced to one, who is elected by a constituency consisting of 586 electors. For municipal purposes the town has been divided by the late act into the three wards of Westgate, Fairgate, and Laurencegate, and is governed by the corporation, which consists of a mayor, 6 aldermen, and 18 councillors, under the title of the "Mayor, Sheriffs, Burgesses, and Commonalty of the town of Drogheda."

The town has always been considered by the English as a place of much importance. In the reign of Edward III. it was classed, along with Dublin, Waterford, and Kilkenny, as one of the four staple towns of Ireland. Richard II. received in it the submissions of O'Neal, O'Donnel, and other chieftains of Ulster and Leinster. The right of coining money was granted to it. Parliaments were several times assembled in it, in one of which the value of money was raised, by altering the silver groat or fourpenny piece to sixpence. In another parliament, also held here, in the beginning of the reign of Edward IV., the town was granted the right of having a university, with the same privileges as that of Oxford. The plan however failed, owing to the poverty of the town and the unsettled state of the country; and an attempt lately made by the corporation to re-assert the right was also unsuccessful. One of the Earls of Desmond was beheaded here on a charge of high treason, brought against him in parliament by the Earl of Worcester when lord-lieutenant. Here also the celebrated statutes known by the name of Poyning's Laws, which made such a change in the political relations between England and Ireland, were enacted. In the civil wars of 1641 the town was besieged by O'Neal and the northern Irish forces; but was gallantly defended by Sir Henry Tichbourne, and after a long blockade relieved by the Marquis of Ormond. The same nobleman relieved it a second time, when invested by the parliamentary army under Colonel Jones. In 1649 Cromwell appeared before it at the head of a numerous and well-appointed army. The town was taken after a short though spirited defence; and nearly every individual in it, without distinction of age or sex, was put to the sword. Thirty only escaped, who were afterwards transported as slaves to Barbadoes. In 1690 it was garrisoned by King James's army; but after the decisive battle of the Boyne it surrendered to the conqueror without a struggle, in consequence of a threat that quarter would not be granted if the town were taken by storm. Its subsequent history is not marked by any circumstance of striking political notoriety.

Of the ancient fortifications very few relics remain. The only one of its four gates still in existence is that of St Laurence, which forms a very picturesque object. The modern town, built chiefly on the northern bank of the Boyne, is divided into four principal parts or quarters, by the two main streets that intersect each other at the Tholsel. The bridge which connects this portion with the southern is narrow, and by no means well suited to the great and increasing current of passengers and vehicles that take advantage of it. The principal public buildings are, the mayoralty-house, to which a suite of assembly-rooms is attached; the Tholsel, a square building of cut stone, with a cupola; the corn-market, the linen-hall, two parish churches, and several Roman Catholic chapels, the largest of which is that of St Peter. There are also several religious houses, in one of which, the abbey of Dominican nuns, without St Laurence's gate, is still preserved the head of Oliver Plunket, Roman Catholic archbishop of Armagh, who was executed at Tyburn in the year 1681, on an unfounded charge of treason. His body, having been interred in St Giles', London, was afterwards removed to the Continent. A classical school, under the endowment of Erasmus Smith, is maintained here. There are also several free schools, the principal of which, called the Patrician school, accommodates 150 pupils. Among the charitable institutions is one for the reception of thirty-six clergymen's widows, who are each provided with a house and an annuity of L.26 during life, arising from bequests made by two archbishops of Armagh. Here is also an alms-house for twenty-four aged widows, an infirmary, and a mendicity association for the suppression of street-begging, by which poor persons are provided with food and employment, but are not lodged.

Drohiczyn || Droitwich.

The former importance of Drogheda may also be inferred from the numerous remains of its monastic institutions. The principal were, the hospital of St Mary, for the sick and infirm; the priory of St Laurence, which was granted to the corporation on the dissolution of the monasteries; the Dominican friary, of which a tower of stately proportions still exists; the Grey friary, and the Augustinian friary; all in the northern part of the town. On the southern side were the hospital of the Knights of St John of Jerusalem, and the Carmelite friary. The archbishops of Armagh had a palace in the town, built by Archbishop Hampton about the year 1620.

Drogheda was until lately the seat of an extensive manufacture of coarse linens, on the decline of which the cotton manufacture supplied its place. Brewing and tanning are carried on largely. Four fairs are held annually, on May 12, June 22, August 26, and October 29. It is also a great place of export for grain, hides, and butter. Vessels of 200 tons can lie at the quay. The communication with the country is facilitated by means of the Boyne navigation, which is carried on for 9 miles, chiefly in the bed of the river, to Slane; 6 miles of still water navigation continue it thence to Navan, and 7 more to Trim. The chief articles conveyed by it are coal, slate, timber, iron, and salt upwards; grain, yarn, and linen downwards. The salmon fishery on the Boyne was once very valuable; the fish is is highly esteemed for its flavour.

About 4 miles west of the town is the village of Old Bridgeton, memorable for the celebrated and decisive victory gained by William of Orange over James II. The battle, which marks one of the great epochs in Irish history, is fully detailed in every general account of the country. The precise point where the main body of the British army crossed the Boyne during the action, and where the aged Duke Schomberg was killed whilst leading on his men, is marked by an elegant obelisk 150 feet high, having on each side of its pedestal an appropriate inscription.

DROHICZYN, a town of Russian Poland, province of Bialystock, and 58 miles S.S.W. of the town of that name. It stands on the right bank of the Bug, and has four churches, three convents, a Piarist college, and about 2000 inhabitants. It was formerly the capital of Podlachia.

DROHOBYCZ, a town of Austrian Galicia, circle of Sambor, and 17 miles S.E. of the town of that name. It is situated on the Tiszmanicka; is a place of considerable trade, particularly in corn, cattle and salt; and contains several churches, convents, and schools, and about 8000 inhabitants, including the suburbs. In the vicinity are some salt mines.

DROITWICH, a municipal and parliamentary borough and the seat of a poor-law union in Worcestershire, is situated on the river Salwarpe, 7 miles N.N.E. of Worcester, and 116 miles N.W. by W. from London. The borough returns one member to parliament, and is governed by a municipality consisting of four aldermen and twelve councillors, one of whom is mayor. The livings are in the archdeaconry and diocese of Worcester. Pop. (1851) 3125; of extended parliamentary borough, 7096. From a very remote date, Droitwich has been famous for its *wyches* or salt

springs. These were known to the Romans, who had a station called *Salinæ* on the spot now occupied by the town of Droitwich. In the formation of the Oxford and Wolverhampton railway, remains of a Roman villa were discovered, containing some interesting and valuable relics which have been carefully preserved. In "Domesday Book," mention is made of a tax imposed upon the salt mines of Droitwich. King John granted a charter to the borough.

The chief public buildings of Droitwich are the Court Chamber, a handsome edifice, and the churches of St Andrew and St Peter, besides the chapels of the Plymouth Brethren and the Methodists. Droitwich also possesses national and infant schools, and an admirably conducted hospital, which maintains about forty men and women, besides educating 100 young persons of both sexes. Droitwich possesses a very large trade in salt, of which it produces annually upwards of 60,000 tons. The canals and railways which pass the town at short distances afford great facilities for the transit of this article to other parts of the country.

DROME, a department in the S.E. of France, bounded on the W. by the Rhone, which separates it from Ardèche; on the N. and N.E. by the department of Isère; on the E. by that of the Hautes-Alpes; on the S.E. by that of Basses-Alpes; and S. by that of Vaucluse. Its greatest length from north to south is about 78 miles; its greatest breadth nearly 50 miles; its area about 2500 square miles. Pop. (1851) 326,846.

Though separated from the maritime Alps by the departments of the Hautes and Basses-Alpes, Drôme is covered in its eastern parts by spurs of that chain. One of the largest of these spurs forms, for a considerable distance, the eastern boundary of the department, on which side it throws up the three lofty peaks of Embel, Tous, and Ventoux. The ridges (for the most part wooded) which traverse the department with tolerable regularity from east to west, are all off-shoots from this Alpine spur. These ridges divide the department in its whole extent into three great natural divisions or valleys, with a general slope westwards to the Rhone. These valleys are that of the Isère in the north, that of the Drôme, from which the department derives its name, and which occupies the central portion of the province, and that of the Aigues which occupies all its southern part. The affluents of the Rhine which water this southern portion are the Roubion, the Berre, the Dèze, the Aigues, and the Ouvèze. The soil of the department, naturally not very fertile, is thin and sandy. The disposition of its various elevations presenting a series of basins rising over each other in the manner of an amphitheatre, is very favourable to the construction of artificial canals for the purposes of irrigation. These canals are very numerous, and are managed with much skill by the inhabitants. As the department is generally mountainous, its climate is rather cold than temperate, but on the whole bracing and healthy. Snow is visible on the mountain-tops during the greater part of the year; but the summer-heat in the valleys that border the Rhone is intense. The prevailing winds are those of the north and south.

In the more inaccessible mountains bears, wild-goats, and chamois are found in great numbers, as well as some of the larger kinds of birds of prey. In the lower grounds wolves and foxes abound. On the islands in the Rhone and on the banks of some of the inland lakes, some colonies of beavers are still to be seen. The department abounds in game, both great and small of every kind; but except the sheep and swine the domestic animals are nowise remarkable. The principal forest-trees found in Drôme are the pine, the beech, and the oak. In the valleys the olive, chestnut, almond, and mulberry trees are a great source of wealth to the natives. Black truffles of the finest quality also grow in great abundance. The botanical flora of the department is rich and various. The mineral wealth of the department is considerable, as in various parts of it are found mines of iron, copper, lead, and coal, besides marble and granite quarries. Rock-crystal of fine quality is also found, as well as black and red clay for pottery, chalk, &c. There are numerous mineral wells throughout the department; the most celebrated is that of Dieu-le-fit. For administrative and political purposes the department is divided into the four arrondissements of Valence, Die, Montélimart, and Nyons, comprising 28 cantons and 360 communes: it forms part of the seventh military division, the headquarters of which are at Lyons: its legal tribunals are under the royal court of Grenoble. It returns four deputies to the imperial parliament, and is divided into the four electoral arrondissements of Valence, Romans, Montélimart, and Crest. Agriculture is not very far advanced in the Drôme. About two-fifths of the soil are arable and yield good corn crops, though barely sufficient for the requirements of the people. Two-sevenths of the entire surface are covered with woods, while two-ninths of it are unimprovable moorland. Large quantities of excellent wines are made in the Drôme, and of these nearly nine millions of gallons are annually exported. The best of these wines are the red and white hermitage. The territorial revenues of the department are estimated at about half-a-million sterling. The manufacturing and commercial industry of the department is very considerable. The most important article of produce is silk, of which about 500,000 lbs. are annually produced. Besides this, however, there are important manufactures of coarse cloths, serges, cotton-yarn, oil, brandy, leather, paper, bricks, &c. The total number of workshops and factories in the department is 711, besides 500 wind and water mills, and 5 blast-furnaces. The total number of annual fairs is 440.

DROMEDARY. See index to MAMMALIA.

DROMORE, a town of Ireland, county of Down, on the Lagan, 84 miles N. by E. of Dublin, on the great northern road to Belfast. Pop. (1851) 1872. The chief branch of manufacture carried on is that of linens, and many of the inhabitants are employed as linen weavers. The cathedral or parish church, a mean structure, contains the remains of Jeremy Taylor, and other bishops.

DRONE, the male of the honey bee. Sometimes other flies also are so named. See BEE.

DRONERO, a town of Piedmont, province of Coni, and 10 miles W.N.W. of the town of that name. It stands on the Maira, here crossed by a fine bridge, and contains about 7000 inhabitants. The chief manufacture is that of linens.

DRONFIELD, a township of England, Derbyshire, $5\frac{1}{2}$ miles N.N.W. of Chesterfield. The parish church is a fine old building, with a tower and spire, chiefly in the decorated style. The principal manufactures are cutlery and iron wares. Pop. (1851) 2469.

DRONTHEIM, a town of Norway. See TRONDHEIM.

DROPPING-TUBE, a convenient instrument for measuring liquids drop by drop. It is a glass tube with a hollow bulb near its lower end, which terminates in a small orifice.

DROPSY (Lat. *hydrops*), in *Medicine*, an unnatural collection of serous fluid in any part of the body. See PATHOLOGY.

DROSSEN, a town of Prussia, province of Brandenburg, and government of Frankfurt, 16 miles N.E. of the town of that name. Manufactures—woollen and linen goods. Pop. (1849) 4647.

DROWNING. This term usually signifies the extinction of life by total submersion; but it ought also to be applied to that species of suffocation which is produced by the exclusion of atmospheric air from the lungs by any liquid; for the effects produced in all such cases are similar. Drowning, therefore, may be considered as having taken place when the animal perishes from immersion of its head, or even from the obstruction to the air passages by a fluid.

The ordinary phenomena of drowning may be witnessed by submerging a small animal in a glass vessel filled with water. The animal at first struggles violently, and is soon observed to make a forcible *expiration*, as is indicated by the escape of bubbles of air from its mouth and nose. It next attempts to inspire; an effort marked by the strong heaving of its thorax, and convulsive efforts of its abdominal muscles. This effort is vain, and is speedily followed by the extrication of a few more air bubbles from its lungs. These convulsive motions are repeated at shorter intervals, while smaller portions of air are forced from the lungs at each succeeding expiration, until the air cells are deprived of a considerable portion of the air they contained at the moment of submersion. Insensibility soon comes on; but convulsive movements of the limbs mark the progress of cerebral congestion, and the influence of unoxygenated blood on the centre of the nervous system.

After these struggles, the animal is apparently dead; but a feeble motion may still be perceived in the chest; and before it ceases altogether, the muscles of the thorax are once more thrown into action by an ineffectual effort to breathe. Brodie has remarked, that in drowning, the action of the heart and diaphragm cease almost at the same instant. Unless the animal be removed from the water before the movements of the heart and diaphragm have entirely ceased, it perishes, and a minute or two more are sufficient to destroy it. If the animal be removed from the water while the heart and diaphragm are yet in action, it may escape from the immediate risk of suffocation, but yet may die from injury to the brain, produced by congestion of dark blood on that organ. Bichat, Cruickshank, and Brodie, have proved that dark unoxygenated blood acts as a poison on the brain, causing diminished nervous energy, laborious respiration, feeble pulse, dilated pupils, stupor, and convulsive twitches of the voluntary muscles.

Signs of death from Drowning.—The signs of death from drowning are *external* and *internal*. 1. The external signs most usually perceived are—either a very pale countenance, or the face bloated and livid; the lips, and not unfrequently the whole head, swelled; the eyes half open, and the pupils much dilated; the tongue swelled, and protruded between the teeth, so as to be in contact with the inner surface of the lips; the lips and nose often lined with a whitish froth; the chest and epigastrium tumid, and much arched; the ends of the fingers usually excoriated; and the spaces under the nails often filled with sand or mud. 2. The most usual internal signs are more or less cerebral congestion; but in some cases no morbid change appears in the brain. We usually find the blood in the vessels of the head, and indeed in the whole body, of a blackish colour. There is generally frothy mucus in the trachæa, which is sometimes tinged with blood; the lungs are dilated and gorged with blood; the diaphragm descends low into the abdomen, and has lost more or less of its concave surface towards that cavity. The right cavities of the heart, and the great vessels connected with it, are gorged with black blood, whilst the left side and its vessels are usually found empty. The blood in the body always remains fluid, and readily flows wherever an incision is made. Water is sometimes found in the bronchial tubes and cells of the lungs; and not unfrequently some water has been swallowed in the act of drowning. These symptoms will generally enable us to detect a death from drowning, if we examine the body before putrefaction is advanced.

The immediate cause of death from drowning has given rise to much controversy; and physiologists have appealed to contradictory experiments and observations in support of their different hypotheses. But this difference of opinion has originated in physiologists supposing that the suspension of the vital functions on submersion always depended on the same proximate cause. It is singular that the very dissimilar appearances which the face presents in different cases did not suggest some difference in the cause of death. In some drowned persons, the face is remarkably pale, and rather pinched; in others, the countenance is livid, and the whole head swelled; the first indicating the deficiency of blood in the head, the latter its redundancy. This led Dr Desgranges to the conclusion that there were two different modes in which drowning proved fatal.

The first, which he terms *nervous or syncopal asphyxia*, occurs when the person, either from the terror of impending fate, the effect of surprise, or from the sudden immersion in extremely cold water, faints at the instant of immersion. The instantaneous arrestation of the movements of the heart in such cases prevents the transmission of unoxygenated blood to the brain; the principle of life is merely suspended; the resources of the animal machine are not destroyed, but are capable of being again called into action by suitable means. The second, Desgranges terms *asphyxia by suffocation.* In this species the heart continues to act for some time after respiration is impossible. The brain thus becomes loaded with black or unoxygenated blood, which is known to act as a direct sedative or a poison on that delicate organ. When this has gone on for a short time, its functions are annihilated, and cannot be restored when the body is again exposed to atmospheric air. In this second species water often finds its way into the air tubes, and even into the cells of the lungs, during the vain efforts of the individual to breathe.

These distinctions are important, will serve to explain most of the anomalies which have been observed as effects of submersion, and render probable the very extraordinary instances of resuscitation after long-continued submersion, which have been related by men worthy of credit, but which have appeared marvellous to those whose ideas of drowning are founded on a few experiments made on the lower animals forcibly submerged.

Amongst individuals who have recovered from insensibility induced by long submersion, by far the majority are those who have been affected by *syncopal asphyxia*, in whom there has been instantaneous arrestation of the motion of the heart, and suspension of consciousness. This distinction will enable us also to explain why, when several persons are submerged together, some will be found quite irrecoverable; whilst others, who have been considerably longer under water, may be capable of resuscitation.

The recovery from *syncopal asphyxia* is well illustrated by a case given by Plater. A female, condemned for infanticide, was inclosed in a sack, according to the provisions of the *Caroline Code* of Germany, and thrown into the Rhine. She fainted at the moment of immersion; and, after having been under water for a quarter of an hour, was drawn out and restored to life.

Pouteau relates the history of a man at Lyons who suddenly fell into a river covered with ice, and remained submerged for three hours, yet was restored to life by the long-continued assiduity of his medical attendant. Morgagni mentions the case of a man who was resuscitated after having been under water for half a day; and Pechlin relates the instance of a Swedish gardener who was submerged in a frozen pond for sixteen hours, and yet was recovered by similar means. This case is so extraordinary that we give it in the author's own words:—

"Hortulanus Tronningholmensis etiamnum vivens, annos natus 65 pro illâ ætate satis adhuc valens et vegetus, cùm ante 18 annos, alii in aquas delapso opem ferre vellet, forte fortunâ et ipse per glaciem incautiùs procedens, aquas incidit 18 ulnas profundas: ubi ille, corpore erecto quasi ad perpendiculum, pedibus fundo adhæsit. Constitit sic per 16 horas, antequàm produceretur in auras. Hoc statu dum 16 horas permansit frustrà quæsitus, tandem repertum, conto in caput infixo, cujus etiam sensum se habuisse dixit, fundo extraxerunt, sperantes ex more aut persuasione gentis revicturum

esse. Itaque pannis linteisque productum obvolvunt, ne aëre admitti possit perniciosus futurus subito illapsu: custoditum sic satis ab aëre sensim sensimque tepidiori loco admovent mox calidis adoriuntur fasciis, fricant, radunt, et sufflaminatum tot horis sanguinis corporisque motum negotiosâ illâ operâ reducunt: denique antapoplecticis et genialibus liquoribus vitæ reddunt et pristinæ mobilitati. Retulit is atque ostendit se etiamnum in capite circumferre vestigia violentiæ à conto illatæ, et cephalalgiis vexari gravissimis. Et propter hunc ipsum casum, religiosè à popularibus, et hujusce rei restibus probatum, Serenissimæ Reginæ matris munificentiâ et annuo stipendio est donatus—et Serenis. Principi—oblatus vivus sui testis—Consignatam manu habes Historiam D. Tilasii, Biblioth. Reg. Præfecti, qui testatus est se prænovisse mulierem, quæ tres ipsos dies sub aquis hæsit, et similem in modum, quo Hortulanus ille, resuscitata, adhuc dum lucis plenâ fruitur usurâ. Accedit Nob. Burmanni—fides, qui confessus est,—se in pago Boness parochiæ Pithoviæ concionem frequentâsse funebrem, in quâ, dum acta rescenseret Præco Senis cujusdam septuagenarii Laur. Jonæ—audiverit ex ore Concionatoris, vivum eum, adolescentem septemdecim annorum, aquis submersum, septem demum hebdomadâ (rem prodigiosam!) extractum ad se rediisse vivum et incolumen."—(Pechlin, *De Aer. et Alim. def.* c. 10.)

In all such cases, Desgranges conceives that the capability of recovery is to be attributed to the sudden arrestation of the vital motions at the moment of immersion. The action of the heart and of the lungs ceasing simultaneously, no vitiated blood could be transmitted to the brain. A stop would at the same time be put to all secretions and excretions, so that there could be no expenditure of vital power. How long this suspension might continue without extinction of vitality, is unknown; but something resembling it occurs in some long-continued paroxysms of hysteria, and in persons who have for several days lain apparently dead, but have been resuscitated. The causes of death from drowning are regarded as rather more complex by Devergie. He considers it as produced in *five* modes: by simple asphyxia; by syncope; by cerebral commotion, in which the vital functions are affected through the medium of the nerves; by apoplexy; by a union of several of these causes. Death from asphyxia combined with syncope, or with cerebral congestion, he states as including five-eighths of all the cases of drowning.

Drowning has been ascribed to water finding its way into the stomach and air passages; but this opinion was proved to be fallacious by Senac and Cullen. The former denied that water ever entered the lungs; but Morgagni showed that it actually does sometimes enter the air cells; and he ascribes the frothy mucus found in the fauces and air-tubes to the intermixture of air with that water. The opinion of Morgagni on this last point is, however, incorrect; for the froth is found in many cases of asphyxia from noxious gases, in epilepsy, and apoplexy; and in the experiments of Dr Marshall Hall, it was observed in dogs that had been bled to death. It appears to be produced by the escape of air from the lungs mixing with the natural mucus lining the air passages, and indeed is common to all cases of laborious respiration. Goodwyn and Cullen showed the insufficiency of the water which finds its way into the lungs in drowning to cause speedy death.

The excoriation of the ends of the fingers is produced by the person endeavouring to save himself by catching at the bottom, or the first solid which meets his hands; and the sand and mud under the nails have the same origin. In fact, we are by these marks often able to discover whether a person has been drowned, or thrown into the water after death. The tumid state of the chest, and descent of the diaphragm into the abdomen, are caused by the violent efforts made to dilate the chest for the relief of the sense of suffocation. The fluidity of the blood is remarkable, and seems almost universal in drowning. This appearance takes place wherever death is caused by the exclusion of oxygen, or when the blood does not undergo the usual changes in the lungs.

Treatment of Drowned Persons.—Various directions have been given for the treatment of persons who have been found in a state of asphyxia from submersion. The subject claimed the especial attention of De Haen, of John Hunter, and Cullen, each of whom has made many judicious remarks on the best means of restoring animation; and the Humane Society of London laid down twelve general rules for the recovery of drowned persons, which were, on the whole, useful, although some of them are now completely obsolete.

The principal objects in such cases should be,—

1st, *To restore or keep up the animal heat.*

2d, *To induce a renewal of respiration.*

3d, *To rouse latent animation by the exhibition of stimuli.*

1. As soon as the body is removed from the water, the wet clothes should be taken off, and the body rolled in warm blankets or dry clothing, while it is transporting to the nearest house. The body should be carried in the arms of men, or on a bier, with celerity but without jolting, to a room which, in hot weather, should have the windows open, but in winter should have a fire. The head, during the transporting, should not be suffered to hang down, but be laid in an easy position. When brought into the apartment in cold or damp weather, the body should be laid on a mattress before a fire, when the surface is to be diligently rubbed with dry warm flannel, both to dry the surface, and to rouse the excitability of the capillaries. Whilst this is going on, it is important to permit the free access of warm air. No more persons should be present than are useful about the patient; and the Humane Society limit the number to six. Sometimes the body has been placed in warm water; but this practice is objectionable. Some recent experiments have rendered it more than probable that the influence of the free application of air to the general surface of the body is not unimportant in restoring animation in cases of asphyxia; and the cutaneous circulation is more readily induced by dry and diligent frictions of the surface than by immersion in warm water. Applications of bags of hot sand, bran, or the like, to different parts of the body, as the arm-pits, scrobiculus cordis, and extremities, are obvious means of restoring animal heat not to be neglected; and in some instances much benefit seems to have been derived from switching the soles and palms with twigs, or striking them with the open hand. Whilst these means are being employed, we must not neglect the important object, viz.

2. The restoration of respiration, by *insufflation* of the lungs. The best and simplest mode of effecting this object is, to introduce the nozzle of a pair of common bellows into one nostril, whilst the operator closes the other nostril and the mouth with his left hand, and applies his right to the thyroid cartilage, pressing it gently backward, in order to shut up the *æsophagus*, and prevent the air entering the stomach instead of the lungs. The bellows should be wrought by an assistant, so as moderately to inflate the chest. A third person is to press the chest with his hands to expel the air. These motions are to be alternated, so as to imitate the natural breathing as much as possible. This mode of insufflation is much preferable to the proposal of introducing a tube into the *glottis*, and still more so to the hazardous operation of tracheotomy, which never can be necessary in a case of simple drowning, and which, even in the hands of the celebrated surgeon Mr Justamond, proved fatal, by permitting the infiltration of blood into the air passages.

When a sufficient supply of oxygen gas can be obtained,

Drowning.

it would probably expedite recovery; but perhaps it should not in general be employed undiluted. Where a pair of bellows cannot be obtained, the life of a person may be saved by introducing any sort of pipe into the nostril, as above directed, and blowing air from the mouth of the operator into the lungs of the drowned person. In this case, care should be taken not to use the air from the lungs of the operator, but merely that which his mouth contains, thrown forward by the compression of his cheeks, in the manner used with the common blow-pipe. But a pair of bellows should always be preferred.

In the original directions of the Humane Society, it was laid down that the body, especially if the subject were a child, "is to be well shaken every ten minutes, in order to render the process of animation more certain." This practice is justly condemned by most modern authors, as either useless or dangerous. All the benefit of "shaking" may be obtained by frictions and switchings, without the risk of extinguishing the feeble remains of animation by rude concussions, "pullings, and pushings," which have been generally employed in cases of asphyxia. It is scarcely necessary to caution the practitioner against the exploded practice of hanging the drowned person by the heels, or laying him across a barrel with his head hanging downwards; a practice of which even Fothergill approves, on the principle of making him disgorge the water that might have found its way into the stomach and lungs, which was erroneously imagined to be the chief cause of suspended animation.

3. The application of various stimulants internally and externally to facilitate resuscitation, is limited, but not unimportant. The vapour of ammonia, to irritate the Schneiderian membrane of the nose, has been generally adopted, and is useful in rousing the dormant excitability. When a tube can be introduced into the stomach, a portion of warm spirit and water, with or without ammonia, will generally be useful. The introduction of warm stimulants by the anus is likewise desirable, both to rouse the latent powers of life by their stimulant effect, and to restore the animal heat.

Another rule of the Humane Society recommended the injection of tobacco smoke into the fundament. This practice was borrowed from the savage Indians of North America; but it is of very questionable utility. The excessive faintness produced by this strong narcotic is a great objection to its employment in cases where the powers of life are already too low; and we have abundant means of exciting the peristaltic motion of the alimentary canal, by aloetic and other warm purgatives, without running the risk of extinguishing the feeble remains of vitality by the introduction of a narcotic. The objection is still stronger to infusions of the plant, which have also been recommended.

The application of voltaic electricity bids fair to aid resuscitation, especially if not used too strong. It has a powerful effect in rousing the voluntary muscles, but its influence on the heart is doubtful. Yet there can be no doubt of its capability of stimulating the diaphragm and abdominal muscles, to cause the dilatation of the chest; and its application to the parts of the body most suitable for this end, as about the lower ribs and the pit of the stomach, should be tried. Common electricity is less suited to this purpose; but neither should be passed through the head, lest the excitability of the nervous system should be exhausted by so powerful and general a stimulant.

Blood-letting was reprobated by John Hunter; and in cases of drowning where there are marks of *syncopal asphyxia*, it will probably prove injurious; but when there are decided marks of cerebral congestion, venesection, under the direction of a medical practitioner, will facilitate recovery.

These methods of resuscitation should be diligently employed for four or five hours at least, before the case is given up as hopeless. It is a vulgar and a dangerous error to suppose that because our efforts do not seem successful for one or two hours, that the patient is irrecoverably dead. There are instances of persons submerged, in whom no symptoms of returning animation have been obvious until after four, or even six hours of unremitted efforts. (T. S. T.)

Drugget || Druids.

DRUGGET (Fr. *droguet*), a coarse but rather flimsy woollen fabric, and sometimes half wool half thread; sometimes corded, but usually plain.

DRUIDÆ, or DROIUM, in *Ancient Geography*, a very ancient town, the principal place of the Gallic Druides or Druidæ, as they are called; now *Dreux* in the Orleannois. Here, according to Cæsar, they met every year in a consecrated grove. The town was also called *Durocases*.

DRUIDS, DRUIDES, or DRUIDÆ, the priests or ministers of religion amongst the ancient Celtæ or Gauls, the Britons, and the Germans.

Some authors derive the word from the Hebrew דרושים, *derussim*, or *drussim*, which they translate *contemplatores*. Picard (*Celtopæd.* lib. ii. p. 58) believes the druids to have been thus called from *Druis* or *Dryius*, their leader, the fourth or fifth king of the Gauls, and father of Saron or Naumes. Pliny, Salmasius, Vigenère, and others, derive the name from δρυς, *quercus, oak*, on account of their inhabiting, or at least frequenting and teaching, in forests; or perhaps because, as Pliny says, they never sacrificed except under the oak. But it is hard to imagine how the druids should have come to speak Greek, even although Cæsar assures us that they had the Greek letters. Ménage derived the word from the old British *drus*, a dæmon or magician; and Borel, from the Saxon *dry*, a magician, or rather from the old British *dru* or *derw*, an oak; whence he supposes δρυς to be derived, which indeed is not an improbable supposition. Becanus (lib. i.) takes *druis* to be an old Celtic and German word, formed from *trowis* or *truwis*, a doctor of the truth and the faith; and in this etymology Vossius is disposed to acquiesce.

General account of the druids.

The druids were the first and most distinguished order among the Gauls and Britons. They were chosen out of the best families; and the honours of their birth, joined with those of their function, procured them the highest veneration among the people. They were conversant in astrology, geometry, natural philosophy, politics, and geography: they were the interpreters of religion, and the judges in secular affairs: whoever refused obedience to them was declared impious and accursed. We know but little as to their peculiar doctrines, only that they believed the immortality of the soul, and, as is generally supposed, in the metempsychosis; though it appears highly probable that they did not believe in this last doctrine, at least not in the sense of the Pythagoreans.

The chief settlement of the druids in Britain was in the isle of Anglesey, the ancient *Mona*, which they chose for this purpose, as it was well stored with spacious groves of their favourite oak. They were divided into several classes or branches, namely, the *vacerri*, *bardi*, *eubages*, *symnothii* or *semnothei*, and *saronidæ*. The *vacerri* are held to have been the priests; the *bardi* were the poets; the *eubages* were the augurs; and the *saronidæ* were the civil judges and instructors of youth. As to the *semnothei*, who are said to have been immediately devoted to the service of religion, it is probable that they were the same with the *vacerri*. Strabo, however, and Picard after him in his *Celtopædia*, do not comprehend all these different orders under the denomination of Druids, as species under their genus, or parts under the whole, but make them quite different conditions or orders. Strabo in effect only distin-

Druids.

guishes three kinds, *bardi*, *vates*, and *druids*. The *bardi* were the poets; the *vates*, ουατεις, apparently the same with the *vacerri*, were the priests and naturalists; and the *druids* were those who, besides the study of nature, applied themselves to that of morality.

Diogenes Laertius assures us in his prologue, that the druids were the same among the ancient Britons with the sophoi or philosophers among the Greeks, the magi among the Persians, the gymnosophists among the Indians, and the Chaldeans among the Assyrians.

Their garments were remarkably long; and, when employed in religious ceremonies, they always wore a white surplice. They generally carried a wand in their hands; and wore a kind of ornament enchased in gold about their necks, called the *druid's egg*. Their necks were likewise decorated with gold chains, and their hands and arms ornamented with bracelets. They wore their hair very short, and their beards remarkably long.

The druids had one chief or arch-druid in every nation, who acted as high priest, or *pontifex maximus*. He possessed absolute authority over the rest, and commanded, decreed, or punished, at pleasure. At his death he was succeeded by the most considerable amongst the survivors; and if there were several pretenders, the matter was ended by an election, or else put to the decision of arms.

The druids, we have observed, were in the highest esteem. They presided at sacrifices and other ceremonies, and had the direction of every thing relating to religion. The British and Gallic youth flocked to them in crowds to be instructed by them. With the children of the nobility, Mela tells us, they retired into caves, or the most desolate parts of forests, and kept them there sometimes for twenty years under their discipline. Besides the immortality and metempsychosis, their disciples were here instructed in the motion of the heavens and the course of the stars, the magnitude of the heavens and the earth, the nature of things, the power and wisdom of the gods, and a variety of other doctrines. They preserved the memory and actions of great men in their verses, which they never allowed to be written down, but made their pupils get by heart. In their common course of learning, they are said to have taught them twenty-four thousand such verses. By this means their doctrines appeared more mysterious by being unknown to all but themselves; and having no books to recur to, they were the more careful to fix these doctrines in their memory.

They worshipped the Supreme Being under the name of *Esus* or *Hesus*, and the symbol of the oak; and had no other temple than a wood or a grove, where all their religious rites were performed. Nor was any person admitted to enter that sacred recess, unless he carried with him a chain, in token of his absolute dependence on the Deity. Indeed their whole religion originally consisted in acknowledging that the Supreme Being, who made his abode in these sacred groves, governed the universe, and that every creature ought to obey his laws and pay him divine homage.

They considered the oak as the emblem, or rather the peculiar residence, of the Almighty; and accordingly chaplets of it were worn both by the druids and the people in their religious ceremonies, whilst the altars were strewed with its leaves and encircled with its branches. The fruit of it, especially the misletoe, was thought to contain a divine virtue, and to be the peculiar gift of heaven. It was therefore sought for on the sixth day of the moon with the greatest earnestness and anxiety, and when found it was hailed with raptures of joy. As soon as the druids were informed of this fortunate discovery, they prepared every thing for the sacrifice under the oak, to which they fastened two white bulls by the horns; then the arch-druid, attended by a prodigious number of people, ascended the tree, dressed in white, and, with a consecrated golden knife or pruning-hook, cropped the misletoe, which he received in his *sagum* or robe, amidst the rapturous exclamations of the people. Having secured this sacred plant, he descended the tree; the bulls were sacrificed; and the Deity invoked to bless his own gift, and render it efficacious in those distempers in which it should be administered.

The consecrated groves, in which they performed their religious rites, were fenced round with stones, to prevent any person's entering between the trees, except through the passages left open for that purpose, and which were guarded by some inferior druids, to prevent any stranger from intruding into their mysteries. These groves were of different forms; some quite circular, others oblong, and more or less capacious as the votaries in the districts to which they belonged were more or less numerous. The area in the centre of the grove was encompassed with several rows of large oaks set very close together. Within this large circle were several smaller ones surrounded with large stones; and near the centre of these smaller circles were stones of a prodigious size and convenient height, on which the victims were slain and offered. Each of these being a kind of altar, was surrounded with another row of stones, the use of which cannot now be known, unless they were intended as cinctures to keep the people at a convenient distance from the officiating priest.

Suetonius, in his life of Claudius, assures us that the druids sacrificed men; and Mercury is said to have been the god to whom they offered these victims. Diodorus Siculus observes, that it was only upon extraordinary occasions they made such offerings; as, to consult what measures to take, or to learn what should happen to them, by the fall of the victim, the tearing of his members, and the manner in which his blood gushed out. Augustus condemned the custom, and Tiberius and Claudius punished and abolished it.

We learn from Cæsar that the druids were the judges and arbiters of all differences and disputes, both public and private; they took cognizance of murders, inheritances, boundaries, and limits, and decreed rewards and punishments. Such as disobeyed their decisions they excommunicated, which was their principal punishment; the criminal being thereby excluded from all public assemblies, and avoided by all the world, so that nobody durst speak to him, for fear of being polluted.[1] Strabo observes they had sometimes interest and authority enough to stop armies upon the point of engaging, and accommodate their differences.

Their opinions and philosophy.

It has been disputed whether the druids were themselves the inventors of their opinions and systems of religion and philosophy, or received them from others. Some have imagined that the colony of Phocians which left Greece and built Marseilles in Gaul about the 57th olympiad, imported the first principles of learning and philosophy, and communicated them to the Gauls and other nations in the west of Europe. It appears indeed that this famous colony contributed not a little to the improvement of that part of Gaul where it settled, and to the civilization of its inhabitants. "The Greek colony of Marseilles,"

[1] The *aquæ et ignis interdictio* of the Roman law was probably borrowed from and founded on the druidical excommunication, just as the "letters of intercommuning" in the reigns of Charles II. and James II. were a reproduction of the Roman penalty.

Druids. says Justin, "civilized the Gauls, and taught them to live under laws; to build cities, and enclose them with walls; to raise corn; to cultivate the vine and olive; and, in a word, made so great a change both in the face of the country and the manners of its inhabitants, that Gaul seemed to be translated into Greece, rather than a few Greeks transplanted into Gaul." But though we may allow that the druids of Gaul and Britain borrowed some hints and embellishments of their philosophy from this Greek colony, and perhaps from other quarters, there is some reason to believe that the substance of it was their own. Others have suggested that the druids derived their philosophy from Pythagoras, who published his doctrines at Crotona in Italy, where he lived above twenty years, in the highest reputation for his virtue, wisdom, and learning. This conjecture seems to be confirmed by the remarkable expression of Ammianus Marcellinus, "That the druids were formed into fraternities, as the authority of Pythagoras decreed." It has also been observed, that the philosophy of the druids bore a much greater resemblance to that of Pythagoras than to that of any of the other sages of antiquity. But it seems probable that Ammianus meant no more by the above expression than to illustrate the nature of the druidical fraternities, by comparing them to those of the Pythagoreans, which were well known to the Romans; and the resemblance between the Pythagorean and druidical philosophy may perhaps be best accounted for, by supposing that Pythagoras learned and adopted some of the opinions of the druids, as well as imparted to them some of his discoveries, or that both were derived from a common source. It is well known that this philosopher, animated by the most ardent love of knowledge, travelled into many countries in pursuit of it, and got himself admitted into every society that was famous for its learning. It is therefore highly probable in itself, as well as directly asserted by several authors, that Pythagoras heard the druids of Gaul, and was initiated into their philosophy.

Learning of the druids.

From the concurring testimonies of several authors, it appears that physiology or natural philosophy was the favourite study of the druids of Gaul and Britain. Cicero tells us that he was personally acquainted with one of the Gaulish druids, Divitiacus the Æduan, a man of quality in his own country, who professed to have a thorough knowledge of the laws of nature, or of that science which the

Physics.

Greeks called *physics* or *physiology*. According to Diodorus Siculus, Strabo, Cæsar, Mela, Ammianus Marcellinus, and others, they entered into many disquisitions and disputations in their schools, concerning the form and magnitude of the universe in general, and of this earth in particular, and even concerning the most sublime and hidden secrets of nature. On these and similar subjects they formed a variety of systems and hypotheses, which they delivered to their disciples in verse, that the latter might the more easily retain them in their memories, since they were not allowed to commit them to writing. Strabo has preserved one of the physiological opinions of the druids concerning the universe, viz. that it was never to be entirely destroyed or annihilated, but was to undergo a succession of great changes and revolutions, which were to be produced sometimes by the power and predominacy of water, and sometimes by that of fire. This opinion, he intimates, was not peculiar to them, but was entertained also by the philosophers of other nations; and Cicero speaks of it as a truth universally acknowledged and undeniable. "It is impossible for us," says he, "to attain a glory that is eternal, or even of very long duration, on account of those deluges and conflagrations of the earth, which must necessarily happen at certain periods." This opinion, which was entertained by the most ancient philosophers of many different and very distant nations, was probably neither the result of rational inquiry in all these nations, nor communicated from one of them to others, but descended to them all from their common ancestors of the family of Noah by tradition, though corrupted and misunderstood through length of time. The agreement of the druids with the philosophers of so many other nations in this opinion about the alternate dissolution and renovation of the world, gives us reason to believe that they agreed with them also in their opinion of its origin from two distinct principles: the one intelligent and omnipotent, which was God; the other inanimate and inactive, which was matter. We are told by Cæsar that they had many disquisitions about the power of God; and, no doubt, amongst other particulars, about his creative power. But whether they believed with some that matter was eternal, or with others that it was created, and in what manner they endeavoured to account for the disposition of it into the present form of the universe, we are entirely ignorant, though they certainly had their speculations on these subjects. We are only informed that they did not express their sentiments on these and similar heads in a plain and natural, but in a dark, figurative, and enigmatical manner. This might incline us to suspect that Pythagoras had borrowed from them his doctrines about numbers, to the mystical energy of which he ascribes the formation of all things; for nothing can be more dark and enigmatical than that doctrine. The druids disputed likewise about the magnitude and form of the world in general, and of the earth in particular, of which things they pretended to have a perfect knowledge. We know not what their opinions were about the dimensions of the universe or of the earth, but there is reason to think that they believed both to be of a spherical form. This is visibly the shape and form of the sun, moon, and stars, the most conspicuous parts of the universe; and hence it was natural and easy to infer that such was also the form of the world and of the earth. This seems to have been the prevailing opinion among philosophers of all nations; and the circle was the favourite figure of the druids, as appears from the form both of their houses and places of worship. Besides these general speculations about the origin, dissolution, magnitude, and form of the world and of the earth, the druids engaged in particular inquiries into the natures and properties of the different kinds of substances. But all their discoveries in this most useful and extensive branch of natural philosophy, whatever they were, have been entirely lost.

Astronomy.

Astronomy also appears to have been one of the chief studies of the druids of Gaul and Britain. "The druids," says Cæsar, "have many disquisitions concerning the heavenly bodies and their motions, in which they instruct their disciples." Mela, speaking of the same philosophers, observes, "that they profess to have great knowledge of the motions of the heavens and of the stars." Some knowledge of this science indeed was not only necessary for measuring time in general, marking the duration of the different seasons, regulating the operations of the husbandman, directing the course of the mariner, and for many other purposes in civil life; but it was especially necessary for fixing the times and regular returns of their religious solemnities, of which the druids had the sole direction. Some of these solemnities were monthly, and others annual. It was therefore necessary for them to know, with some tolerable degree of exactness, the number of days in which the sun and moon performed their revolutions, that these solemnities might be observed at their proper seasons. This was the more essential, as some of these solemnities were attended by persons from different and very distant countries, who were all to meet at one place

on one day, and who must have had some rule to discover the annual return of that day.

Their method of computing time.

The most perceptible division of time by means of the two great luminaries is into day and night; the former occasioned by the presence of the sun above the horizon, the latter by his absence, which is in some measure supplied by the moon and stars. The druids computed their time by nights, and not by days; a custom which they had received by tradition from their most remote ancestors, and in which they were confirmed by measuring their time very much by the motions of the moon, the mistress and the queen of night. As the changes in the aspect of that luminary are most conspicuous, they engaged the attention of the most ancient astronomers of all countries, and particularly of the druids, who regulated all their great solemnities, both sacred and civil, by the age and aspect of the moon. "When no unexpected accident prevents it, they assemble upon stated days, either at the time of the new or full moon; for they believe these to be the most auspicious times for transacting all affairs of importance." Their most august ceremony, that of cutting the misletoe from the oak by the archdruid, was always performed on the sixth day of the moon. Nay, they even regulated their military operations by this luminary, and avoided, as much as possible, to engage in battle whilst the moon was on the wane. As the attention of the druids was so much fixed on this planet, it could not be very long before they discovered that she passed through all her various aspects in about thirty days; and by more accurate observations, they would gradually find, that the real time of her performing an entire revolution was very nearly twenty-nine and a half days. This would furnish them with the division of their time into months, or revolutions of the moon; of which we know with certainty they were possessed. But this period, though of great use, was evidently too short for many purposes, and particularly for measuring the seasons; which, they could not fail to perceive, depended on the influences of the sun. By continued observation they discovered that about twelve revolutions of the moon included all the variety of seasons, which began again and revolved every twelve months. This suggested to them that larger division of time called a year, consisting of twelve lunations or three hundred and fifty-four days, which was the most ancient measure of the year in almost all nations. That this was for some time at least the length of the druidical year, is both probable in itself, and apparent from the expression of Pliny, that "they began both their months and years, not from the change, but from the sixth day of the moon;" which is a demonstration that their years consisted of a certain number of lunar revolutions, as they always commenced on the same day of the moon. But as this year of twelve lunar months falls eleven days and nearly one fourth of a day short of a real revolution of the sun, this error would soon be perceived, and call for reformation; though we are not informed of the particular manner in which it was rectified. Various arguments might be collected to render it very probable that the Britons were acquainted with a year exact enough for every purpose of life when they were first invaded by the Romans; but it will be sufficient to mention one, which is taken from the time and circumstances of that invasion. The learned Dr Halley has demonstrated that Cæsar arrived in Britain, in his first year's expedition, on the 26th day of August; and Cæsar himself informs us, that at his arrival the harvest was finished, except in one field, which by some means or other was more backward than the rest of the country. This is a proof that the British husbandmen knew and used the most proper seasons for ploughing, sowing, and reaping. The druids, as we are told by Pliny, had also a cycle or period of thirty years, which they called an age, and which likewise commenced on the sixth day of the moon; but that author has not acquainted us on what principle this cycle was formed, nor to what purpose it was applied. We can hardly suppose that this was the cycle of the sun, which consists of twenty-eight years, and regulates the dominical letters. It is more probable, that whilst the druids made use of the year of twelve lunar months, and had not invented a method of adjusting it to the real revolution of the sun, they observed that the beginning of this year had passed through all the seasons, and returned to the point whence it set out, in a course of about thirty-three years; which they might therefore denominate an age. Others may perhaps be of opinion that this thirty years cycle of the druids is the same with the great year of the Pythagoreans, or a revolution of Saturn. Some have imagined that the druids were also acquainted with the cycle of nineteen years, which is commonly called the cycle of the moon. But the evidence of this depends entirely on the truth of that supposition, that the Hyperborean island, which is described by Diodorus Siculus, was Britain, or some of the British isles. Amongst many surprising things, that author states, concerning the Hyperborean island, that "its inhabitants believed that Apollo descended into their island at the end of every nineteen years; in which period of time the sun and moon, having performed their various revolutions, return to the same point, and begin to repeat the same revolutions. This is called by the Greeks the great year, or the cycle of Meton."

Their knowledge of the stars

We are told both by Cæsar and Mela, that the druids studied the stars as well as the sun and moon; and that they professed to know, and taught their disciples, many things concerning the motions of these heavenly bodies. From these testimonies we may conclude that the druids were acquainted with the planets, distinguished them from the fixed stars, and carefully observed their motions and revolutions. If this discovery was the result of their own observations, it would be gradual, and it would be a long time before they found out all the planets. They might perhaps have received assistance and information from Pythagoras, or from some other quarter. But whether this discovery of the planets was their own, or communicated to them by others, it is highly probable that they were acquainted with the precise number of these wandering stars. Dio Cassius says, that the custom of giving the name of one of the planets to each of the seven days of the week was an invention of the Egyptians, and from them was gradually communicated to all the other nations of the world; and that in his time this custom was so firmly established, not only among the Romans, but among all the rest of mankind, that in every country it appeared to be a native institution. The knowledge of the planets, and perhaps the custom of giving their names to the days of the week, was brought out of Egypt into Italy by Pythagoras, more than five hundred years before the beginning of the Christian era; and from thence it could not be very long before it reached Gaul and Britain. But though we have little or no reason to doubt that the druids knew the number and observed the motion of the planets, yet it may be questioned whether they had discovered the times in which these bodies performed their several revolutions. Some of the planets, as Jupiter and Saturn, take so great a number of years in revolving, that it required a very extraordinary degree of patience and attention to discover the precise periods of their revolutions. If we could be certain that the island in which the ancients imagined Saturn lay asleep was one of the British isles, as Plutarch intimates it was, we might be inclined to think that the British druids were not ignorant of the length of the period

in which the planet Saturn performs a revolution; for that same author, in another treatise, tells us, that "the inhabitants of that island kept every thirtieth year a solemn festival in honour of Saturn, when his star entered into the sign of Taurus." If we could depend upon this testimony, we should have one positive proof that the druids of the British isles were acquainted with the constellations, and even with the signs of the zodiac; and that they measured the revolutions of the sun and planets, by observing the length of time between their departure from and return to one of these signs. But history supplies no direct evidence that this was really the case. The druids of Gaul and Britain, indeed, as well as the ancient philosophers of other countries, had a general plan or system of the universe, and of the disposition and arrangement of its various parts, in which they instructed their disciples. This is both probable in itself, and is plainly intimated by several authors of the greatest authority. But we cannot be certain whether this druidical system of the world was of their own invention, or was borrowed from others. If it was borrowed, it was most probably from the Pythagoreans, to whom they were the nearest neighbours, and with whom they had the greatest intercourse; or at all events from some oriental sect, order, or caste, of which many are of opinion that they originally sprung.

It has been imagined that the druids had instruments of some kind or other, which answered the same purposes as our telescopes, in making observations on the heavenly bodies. The only foundation of this very improbable conjecture is an expression of Diodorus Siculus, in his description of the famous Hyperborean island. "They say further, that the moon is seen from that island, as if she were but at a little distance from the earth, and having hills or mountains like ours on the surface." But no such inference can be reasonably drawn from this expression, which in reality merits little more regard than that which, according to Strabo, was said of some of the inhabitants of Spain, that "they heard the hissing noise of the sun every evening when he fell into the western ocean."

The application of the druids to the study of philosophy and astronomy amounts almost to a demonstration that they applied also to the study of arithmetic and geometry; for some knowledge of both these sciences is indispensably necessary to the natural philosopher and astronomer, as well as of great and daily use in the common affairs of life. If we were certain that Abaris, the famous Hyperborean philosopher, the friend and scholar of Pythagoras, was really a British druid, as some have imagined, we should be able to produce direct historical evidence of their arithmetical knowledge. For Iamblicus, in the life of Pythagoras, says, that "he taught Abaris to find out all truth by the science of arithmetic." It may be thought improbable that the druids had made any considerable progress in arithmetic, as this may seem to have been impossible by the mere strength of memory, without the assistance of figures and of written rules. But it is very difficult to ascertain what may be done by memory alone, when it has been long exercised in this way. We have had examples of persons who could perform some of the most tedious and difficult operations in arithmetic by the mere strength of memory. The want of written rules could be no great disadvantage to the druids, as the precepts of this, as well as of the other sciences, were couched in verse, which would be easily got by heart and long remembered. Though the druids were unacquainted with the Arabic numeral characters, which are now in use, we have no reason to suppose that they were destitute of marks or characters of another kind, which, in some measure, answered the same purposes, both in making and recording their calculations. In particular, it is believed that they made use of the letters of the Greek alphabet for both these purposes. This seems to be pretty distinctly intimated by Cæsar, who, in speaking of the druids of Gaul, observes, that "in almost all other public transactions and private accounts or computations, they make use of the Greek letters." And this is further confirmed by what he says of the Helvetii, a people of the same origin, language, and manners, with the Gauls and Britons. "Tables were found in the camp of the Helvetii written in Greek letters, containing an account of all the men capable of bearing arms who had left their native country, and also separate accounts of the boys, old men, and women." There is historical evidence of the druids being also well acquainted with geometry. "When any disputes arise," says Cæsar, "about their inheritances, or any controversies about the limits of their fields, they are entirely referred to the decision of their druids." But besides the knowledge of mensuration which this implies, both Cæsar and Mela plainly intimate that the druids were conversant in the most sublime speculations of geometry; "in measuring the magnitude of the earth, and even of the world."

Skill in mechanics.

There are still many monuments remaining in Britain and the adjacent isles, which cannot so reasonably be ascribed to any race as to that of the ancient Britons, and which lead us to think that they had made great progress in this department of knowledge, and could apply the mechanical powers so as to produce very astonishing effects. As these monuments appear to have been designed for religious purposes, we may be certain that they were erected under the direction of the druids. Many obelisks or pillars, of one rough unpolished stone each, are still to be seen in Britain and its isles. Some of these pillars are both very thick and lofty, erected on the summits of barrows and of mountains; and some of them, as at Stonehenge, have ponderous blocks of stone raised aloft, and resting on the tops of the upright pillars. We can hardly suppose that it was possible to cut these prodigious masses of stone, some of them above forty tons in weight, without wedges, or to raise them out of the quarry without levers. But it certainly required still greater knowledge of the mechanical powers, and of the method of applying them, to transport those huge stones from the quarry to the places of their destination; to erect the perpendicular pillars, and to elevate the imposts to the tops of these pillars. If the prodigious stone in the parish of Constantine, Cornwall, was really removed by art from its original place, and fixed where it now stands, it is a demonstration that the druids could perform the most astonishing feats by their skill in mechanics. That the British druids were acquainted with the principles and use of the balance, we have reason to believe, not only from the great antiquity of that discovery in other parts of the world, but also from some druidical monuments which are still remaining in this island. These monuments are called *logan stones*, or rocking stones, and each of them consists of one prodigious block of stone, resting upon an upright stone or rock, and so equally balanced, that a very small force, sometimes even that of a child, can move it up and down, though hardly any force is sufficient to remove it from its station. Some of these stones may have fallen into this position by accident, but others of them evidently appear to have been placed in it by art. That the ancient Britons understood the construction and use of wheels, the great number of their war-chariots and other wheel carriages is a sufficient proof; and that they knew how to combine them together and with the other mechanical powers, so as to form machines capable of raising and transporting very heavy weights, we have good rea-

son to believe. In a word, if the British druids were wholly ignorant of the principles and the use of any of the mechanical powers, it was most probably of the screw, though even of this we cannot be certain.

Medicine.

In Germany and in the northern nations of Europe the healing art was chiefly committed to the old women of every state; but in Gaul and Britain it was entrusted to the druids, who were the physicians as well as the priests of these countries. Pliny says expressly, that "Tiberius Cæsar destroyed the druids of the Gauls, who were the poets and physicians of that nation;" and he might have added, of the Britons. The people of Gaul and Britain were probably induced to devolve the care of their health on the druids, and to apply to these priests for the cure of their diseases, not only by the high esteem they had of their wisdom and learning, but also by the opinion which they entertained, that a very intimate connection subsisted between the arts of healing and the rites of religion, and that the former were most effectual when they were accompanied by the latter. It appears indeed to have been the prevailing opinion of the nations of antiquity, that all internal diseases proceeded immediately from the anger of the gods; and that the only way of obtaining relief from these diseases was by applying to the priests to appease their anger by religious rites and sacrifices. This was evidently the opinion and practice of the Gauls and Britons, who in some dangerous cases sacrificed one man as the most effectual means of curing another. "They are much addicted," says Cæsar, "to superstition, and hence those who are afflicted with a dangerous disease sacrifice a man, or promise that they will sacrifice one, for their recovery. For this purpose they make use of the ministry of the druids, because the latter have declared that the anger of the immortal gods cannot be appeased, so as to spare the life of one man, but by the life of another." This way of thinking also gave rise to that great number of magical rites and incantations with which the medical practices of the druids, and indeed of all the physicians of antiquity, were attended. "Nobody doubts," says Pliny, "that magic derived its origin from medicine, and that, by its flattering but delusive promises, it came to be esteemed the most sublime and sacred part of the art of healing."

Botany.

That the druids made great use of herbs for medicinal purposes, there is sufficient evidence. They not only had a most superstitious veneration for the misletoe of the oak, on a religious account, but they also entertained a very high opinion of its medicinal virtues, and esteemed it as a kind of panacea, or remedy for all diseases. "They call it," says Pliny, "by a name which in their language signifies *All-heal*, because they have an opinion that it cures all diseases." They believed it to be in particular a specific against barrenness, and a sovereign antidote against the fatal effects of poisons of all kinds. It was also esteemed an excellent emollient and discutient for softening and discussing hard tumours, and good for drying up scrofulous sores, and curing ulcers and wounds; and, provided it was not suffered to touch the earth after it was cut, it was thought to be a very efficacious medicine in epilepsy. It has been thought useful in this last calamitous disease by some modern physicians. The pompous ceremonies with which the misletoe was gathered by the druids have been already described. The selago, a kind of hedge hyssop resembling savin, was another plant much admired by the druids of Gaul and Britain for its supposed medicinal virtues, particularly in all diseases of the eyes. But its efficacy, according to them, depended very much upon its being gathered exactly in the following manner: The person who gathered it was to be clothed in a white robe; to have his feet bare, and washed in pure water; to offer a sacrifice of bread and wine before he proceeded to cut it, which he was to do with his right hand covered with the skirt of his garment, and with a hook of some more precious metal than iron. When it was cut, it was to be received and kept in a new and very clean cloth. Gathered exactly according to this whimsical ritual, it was affirmed to be not only an excellent medicine, but also a powerful charm and preservative against misfortunes and unhappy accidents of all kinds. The druids also entertained a high opinion of the herb samolus or mashwort, from its sanative qualities, and gave directions for gathering it, not less fanciful than those which have already been mentioned. The person who was to perform that office was to do it fasting, and with his left hand; he was on no account to look behind him, nor to turn his face from the herbs he was gathering. It would be tedious to relate the extravagant notions they entertained of the many virtues of the vervain, and to recount the ridiculous mummeries which they practised in gathering and preparing it, both for the purposes of divination and physic. It is easy to see that Pliny's information was very imperfect; and that, like many of the other Greek and Roman writers, he designedly represented the philosophers of Gaul and Britain in an unfavourable light. The herb called *Britannica* by the ancients, which some think was the great water-dock, and others the *cochlearia* or scurvy-grass, was probably much used in this island for medicinal purposes, as it derived its name from Britain, and was thence exported to Rome and other parts. Though these few imperfect hints are all that we can now collect of the botany of the British druids, yet there is some reason to think that they were not contemptible botanists. Their circumstances were peculiarly favourable for the acquisition of this kind of knowledge. For as they spent most of their time in the recesses of mountains, groves, and woods, the spontaneous vegetable productions of the earth constantly presented themselves to their view, and courted their attention.

The opinions which, it is said, the druids of Gaul and Britain entertained of the anguinum or serpent's egg, both as a charm and as a medicine, are romantic and extravagant in a very high degree. This extraordinary egg was formed, as they pretended, by a great number of serpents, interwoven and twined together; and when it had been formed, it was raised up in the air by the hissing of these serpents, and was then to be caught in a clean white cloth before it fell to the ground. The person who caught it was obliged to mount a swift horse, and to ride away at full speed to escape from the serpents, who pursued him with great rage, until they were stopped by some river. The way of making trial of the genuineness of the egg was no less extraordinary. It was to be encased in gold, and thrown into a river, and if it was genuine it would swim against the stream. "I have seen," says Pliny, "that egg; it is about the bigness of a moderate apple, its shell is a cartilaginous incrustation, full of little cavities, such as are on the legs of the polypus; it is the insignia or badge of distinction of the druids." The virtues which they ascribed to this egg were many and wonderful. It was particularly efficacious in rendering those who carried it about with them superior to their adversaries in all disputes, and in procuring them the favour and friendship of great men. Some have thought that this whole affair of the serpent's egg was a mere fraud, contrived by the druids to excite the admiration and pick the pockets of a credulous people, who purchased these wonder-working eggs from them at a high price. Others have imagined that this story of the anguinum, of which there is an ancient monument in the cathedral at Paris, was an emblematical representation of the doctrine of the druids concerning the creation of the

world. The serpents, say they, represent the divine wisdom forming the universe, and the egg is the emblem of the world formed by that wisdom. It may be added, that the virtue ascribed to the anguinum, of giving those who possessed it a superiority over others, and endearing them to great men, may perhaps be intended to represent the natural effects of learning and philosophy. But in so doubtful a matter every one is of course at liberty to form what judgment he thinks proper.

Rhetoric. As the influence and authority of the druids in their country depended very much upon the reputation of their superior wisdom and learning, they wisely applied to the study of those sciences which most directly contributed to the support and advancement of that reputation. In this number, besides those already mentioned, we may justly reckon rhetoric, which was diligently studied and taught by the druids of Gaul and Britain, who to the charms of their eloquence were indebted for much of the admiration and authority which they enjoyed. They had indeed many calls and opportunities to display their eloquence, and to discover its great power and efficacy; as, when they were teaching their pupils in their schools; when they discoursed in public to the people on religious and moral subjects; when they pleaded causes in the courts of justice; and when they harangued in great councils of the nation, and at the heads of armies ready to engage in battle, sometimes with a view to inflame their courage, and at other times with a design to allay their fury, and dispose them to make peace. Though this last was certainly a difficult task amongst fierce and warlike nations, yet such was the authority and eloquence of the druids, that they frequently succeeded in it. "They pay a great regard," says Diodorus Siculus, "to their exhortations, not only in the affairs of peace, but even of war; and these are respected both by their friends and enemies. They sometimes step in between two hostile armies, who are standing with their swords drawn and their spears extended, ready to engage; and by their eloquence, as by an irresistible enchantment, they prevent the effusion of blood, and prevail upon them to sheath their swords. So great are the charms of eloquence and the power of wisdom even amongst the most fierce barbarians." The British kings and chieftains, who were educated by the druids, were famous for their eloquence. This is evident from the many noble speeches which are ascribed to them by the Greek and Roman writers. For though these speeches may not be genuine, yet they are a proof that it was a well-known fact that these princes were accustomed to make harangues on such occasions. This we are expressly told by Tacitus: "The British chieftains, before a battle, fly from rank to rank, and address their men with animating speeches, tending to inflame their courage, increase their hopes, and dispel their fears." These harangues were called, in the ancient language of Britain, *brosnichty-kah*, which is literally translated by Tacitus, *incitamenta belli*, incentives to war. The genuine posterity of the ancient Britons long retained their taste for eloquence, and their high esteem for those who excelled in that art. "Orators," says Mr Martin, "were in high esteem, both in these islands (the Hebrides) and the continent, until within these forty years. They sat always among the nobles or chiefs of families in the streah or circle. Their houses and little villages were sanctuaries, as well as churches, and they took place before doctors of physic. The orators, after the druids were extinct, were brought in to preserve the genealogy of families, and to repeat the same at every succession of a chief; and upon the occasion of marriages and births, they made epithalamiums and panegyrics, which the poet or bard pronounced. The orators, by the force of their eloquence, had a powerful ascendant over the greatest men in their time. For if any orator did but ask the habit, arms, horse, or any other thing belonging to the greatest man in these islands, it was readily granted him; sometimes out of respect, and sometimes for fear of being exclaimed against by a satire, which in those days was reckoned a great dishonour."

Magic and divination. If the British druids, considering the times in which they lived, had made no contemptible proficiency in several parts of real and useful learning, it cannot be denied that they were also great pretenders to superior knowledge in certain vain and fallacious sciences, by which they excited the admiration, and took advantage of the ignorance and credulity, of mankind. These were the sciences, if they may be so called, of magic and divination, by means of which they pretended to work a kind of miracles, and exhibit astonishing appearances in nature; to penetrate into the counsels of heaven; to foretel future events, and to discover the success or miscarriage of public or private undertakings. Their own countrymen not only believed that the druids of Gaul and Britain were possessed of these powers, but they were celebrated on this account by the philosophers of Greece and Rome. "In Britain," says Pliny, "the magic arts are cultivated with such astonishing success, and so many ceremonies, at this day, that the Britons seem to be capable of instructing even the Persians themselves in these arts. They pretend to discover the designs and purposes of the gods. The Eubates or Vates in particular investigate and display the most sublime secrets of nature; and by auspices and sacrifices they foretel future events." They were so famous for the supposed veracity of their predictions, that they were not only consulted on all important occasions by their own princes and great men, but even sometimes by the Roman emperors. Nor is it very difficult to account for all this. The druids finding that the reputation of their magical and prophetical powers contributed not a little to the advancement of their wealth and influence, naturally endeavoured to strengthen and establish it by all their art and cunning. Their knowledge of natural philosophy and mechanics enabled them to execute such works, and to exhibit such appearances, or to make the world believe that they did exhibit them, as were sufficient to gain them the character of great magicians. The truth is, that nothing is more easy than to acquire this character in a dark age, and among an unenlightened people. When the minds of men are haunted with dreams of charms and enchantments, they are apt to fancy that the most common occurrences in nature are the effects of magical arts. The following strange story, which we meet with in Plutarch's Treatise of the Cessation of Oracles, was probably occasioned by something of this kind. "There are many islands which lie scattered about the isle of Britain, after the manner of our Sporades. They are generally unpeopled, and some of them are called the *Islands of the Heroes*. One Demetrius was sent by the emperor [probably Claudius] to discover these parts. He arrived at one of these islands [supposed by some to be Anglesey, but more probably one of the Hebrides] next adjoining to the isle of Britain before mentioned, which was inhabited by a few Britons, who were esteemed sacred and inviolable by their countrymen. Immediately after his arrival the air grew black and troubled, and strange apparitions were seen; the winds rose to a tempest, and fiery spouts and whirlwinds appeared dancing towards the earth." This was probably no more than a storm of wind, accompanied with rain and lightning, a thing neither unnatural nor uncommon: but Demetrius and his companions having heard that the British druids, by whom this isle was chiefly inhabited, were great magicians, imagined that it was raised by them, and fancied that they saw many strange and unnatural sights.

The druids did not think proper to undeceive them; for when they inquired about the cause of this storm, they were told that it was occasioned by the death of one of those invisible beings or genii who frequented their isle; a wonderful and artful tale, very well calculated to increase the superstitious terrors of Demetrius and his crew, and to determine them to abandon this enchanted isle, with a resolution never to return. Stonehenge, and several other works of the druids, were, for many ages after the destruction of their whole order, believed to have been executed by the arts of magic and enchantment; nor is it improbable that they persuaded the vulgar in their own times to entertain the same opinion of these works, by concealing from them the real arts by which they had been erected. The natural and acquired sagacity of the druids, with their long experience and great concern in the conduct of affairs, enabled them to form very probable conjectures about the event of enterprises. These conjectures they pronounced as oracles when they were consulted; and they pretended to derive them from the inspection of the entrails of victims, the observation of the flight and feeding of certain birds, and many other mummeries. By these and similar arts they obtained and preserved the reputation of prophetic foresight among an ignorant and credulous people. But these pretensions of the druids to magic and divination, which contributed so much to the advancement of their fame and fortune in their own times, have brought very heavy reproaches upon their memory, and have made some learned moderns declare that they ought to be expunged out of the catalogue of philosophers, and esteemed no better than mere cheats and jugglers. This censure is evidently too severe, and might have been pronounced with equal justice upon all the ancient philosophers of Egypt, Assyria, Persia, Greece, and Rome, who were great pretenders to magic and divination, as well as the druids. "I know of no nation in the world," says Cicero, "either so polite and learned, or so savage and barbarous, as not to believe that future events are presignified to us, and may by some men be discovered and foretold." The only conclusion, therefore, that can be fairly drawn from the successful pretensions of the British druids to the arts of magic and of divination, is this: That they had more knowledge than their countrymen and contemporaries, but had not so much virtue as to resist the temptation of imposing upon their ignorance to their own advantage.

DRUM is a martial instrument in the form of a cylinder, hollow within, and covered at the two ends with vellum, which is stretched or slackened at pleasure by means of small cords or sliding knots. It is beat upon with sticks. Drums are sometimes made of brass, but most commonly of wood. The drum is said by Le Clerc to have been an oriental invention, and to have been brought into Spain by the Arabians, or perhaps rather the Moors.

Kettle DRUMS are two sorts of large basons of copper or brass, rounded in the bottom, and covered with vellum or goat skin, which is kept fast by a circle of iron round the body of the drum, with a number of screws to screw up and down. Drums are much used in the army, as also in operas, oratorios, concerts, and the like. See MUSIC, § *Musical Instruments*.

DRUMMOND, WILLIAM, was born at Hawthornden on the 13th of December 1585. His father was Sir John Drummond, descended from the family of Carnock, a branch of the more illustrious family of Stobhall, from which the king derives his remote lineage through Anabella Drummond, the mother of James the First. The poet's mother was Anne the daughter of William Fowler;[1] and she is described as "a woman of excellent breeding, and of a good and virtuous life." William was the eldest of four sons, and there were three daughters by the same marriage. The earlier part of his education he received at the High School of Edinburgh, where he began to distinguish himself by the superiority of his talents; and being afterwards removed to the university, which was then a very recent institution, he took the degree of A. M. in the year 1605. We are particularly informed that he did not confine his attention to the metaphysical learning commonly taught in the schools, but likewise applied himself to the study of mathematics and of ancient authors. During the following year, his father sent him to complete his education in France; and in the university of Bourges he is said to have devoted himself with great assiduity and success to the study of the civil law; a study necessary to a lawyer, and useful to a scholar. After an absence of four years, he returned to his native country in 1610; and his friends now expected that he would devote himself to the practice of a lucrative profession, for which he seemed eminently qualified by his talents and learning.[2] The bar must however have presented very few attractions to a youth of his elegant taste and delicate sensibility: the municipal law was then but a dreary path, beset with thorns which never blossomed; and, what was particularly discouraging, there was not a single elementary book, there were no institutions of our law, from which a young student could derive a comprehensive knowledge of those principles which were afterwards to direct his practice. His systematic doctrines were indeed to a great extent borrowed from the ancient civilians, and the study of the civil law was generally prosecuted in some foreign university; but, besides an indispensable attendance in the courts, his final preparation for the practice of his profession consisted in reading the statute law, and such collections of maxims and reports as were then circulated in manuscript. Nor was Drummond compelled by any domestic considerations to overcome his repugnance: he was beyond the reach of that original impulse which has directed many a lawyer to reputation and emolument; for, about the period of his return from the continent, the death of his father left him in possession of an estate sufficient to maintain him in the liberal style of a gentleman.

[1] He is commonly described as Sir William Fowler, secretary to the queen, but this account of his quality is evidently erroneous. The secretary was his son, who bore the same name with himself; nor does it appear that either of them received the honour of knighthood. The son followed the queen to England; and a list of the officers of her council, dated in October 1603, describes him as "Secretarie, and Master of the Requests." (Lodge's Illustrations of British History, vol. iii. p. 209.) In 1587, we find him denominated parson of Hawick; and the records of the presbytery, 2 Sept. 1612, mention him as then dead. It is however more than probable that he continued a layman, and, at a period when such irregular proceedings were not uncommon, enjoyed the temporalities of that living without residence and without qualification. His poems are not unknown to those who are acquainted with the literary history of that age. Of some of his manuscripts, as well as those of his nephew, Mr Laing has given an account in the Transactions of the Society of Antiquaries of Scotland, vol. iv.

[2] President Lockhart is said to have averred, that if he had followed the legal profession, he might have made the best figure of any lawyer in his time. But the accuracy of this tradition, says Mr Maitland, "may reasonably be doubted. Drummond has left a record of the books read by him between 1606 and 1614, from which it is apparent that literature occupied a much larger portion of his attention than law. In the detail of his studies, which were in a great measure confined to the most popular poetry and romances of the time, he mentions no other work on law than the Institutes of Justinian." (Introduction to Drummond's Poems. Edinb. 1832, 4to.)

He now retired to his family residence at Hawthornden, six miles from Edinburgh, and resumed the study of the Greek and Latin classics. The immediate vicinity presents an air of such romantic beauty, that a poet could scarcely have found a more suitable habitation: his house is erected on the edge of a woody cliff which overhangs the river Esk; and at one extremity of the variegated and sequestered glen stand the ruins of the baronial castle and the collegiate church of Roslin. The ancient caves of Hawthornden, and the adjacent moor of Roslin, where Comyn and Fraser gained a signal victory over the English, have likewise their peculiar effect in impressing the imagination. Near the poet's house is a seat hewn in the solid rock, and still described by the name of the Cypress-grove; a name which it obtained from the circumstance of his having frequented this spot when engaged in the composition of a work which bears that title.

Here Damon ' sat' whose songs did sometime grace
The murmuring Esk; may roses shade the place.

In this delightful seclusion he devoted himself to the general improvement of his mind, and to the occasional exercise of his fine talents; and many of his poems appear to have been composed about this period of his life.[1] He chiefly cultivated the familiarity of the university men, and other individuals of genius and learning: among his own countrymen, he enjoyed the particular friendship of the earl of Stirling, the earl of Ancram, Arthur Johnston, and John Adamson; and among the English poets, his greatest intimacy and correspondence was with Ben Jonson and Michael Drayton. The grandfather of Jonson was originally from Annandale, where Johnstone is still a very prevalent name. In the year 1619, when this celebrated poet had attained the age of forty-five, he travelled from London on foot, for the express purpose of paying Drummond a visit; and at Hawthornden he spent three or four weeks with every appearance of satisfaction.[2] The heads of some of Jonson's conversations on subjects of literature, together with his own impressions of Jonson's character, he committed to writing, with the manifest intention of occasionally referring to this as a private record: many years after his death, this paper was communicated to the public, apparently in a somewhat mutilated form; and as it does not represent his distinguished guest as altogether faultless, the amiable and esteemed writer has incurred the virulent and unmeasured censure of Mr Gifford, the late editor of Jonson's works.[3] If Drummond had resembled some more recent authors, who have violated all the decencies of private life by ministering to the gross appetite of the public with ridiculous or disparaging tales of their friends and acquaintance, the justice of this strong condemnation could not safely have been disputed; but what person of ordinary candour will thus censure an act which, to all human appearance, was entirely unconnected with malevolent or ungenerous motives?

The poet's tranquillity was exposed to a severe interruption from the unfortunate issue of his first love. He became deeply enamoured of a beautiful young lady, the daughter of Cunningham of Barns; he met with a suitable return, and a day was fixed for their nuptials, but before that day arrived, her life was terminated by a rapid fever. Such an event as this, which would have affected a lover of the most ordinary sensibility, could not but sink deeply into the heart of one who had assiduously cherished the softer feelings, and whose habits of seclusion were so directly calculated to preserve a lasting impression of melancholy. He was so overwhelmed with grief that he found it necessary to try the effect of a change of objects; and he accordingly retired to the continent, where he spent about eight years. His longest residence was at Paris and Rome; but he travelled through France, Germany, and Italy, visited the most celebrated universities, and conversed with men of learning. In the course of his peregrinations, he is said to have formed an excellent collection, not only of the ancient classics, but likewise of the best writers in the French, Italian, and Spanish languages. He presented to the university of Edinburgh a collection of books and manuscripts, of which he printed a catalogue in the year 1627, prefixing to it an appropriate preface written in Latin. Of this well-known collection, the value, that is, the extrinsic or pecuniary value, which was far from being inconsiderable at first, has been immensely encreased by the lapse of two centuries. It contains many Scottish and English publications of singular rarity. When Drummond returned to Scotland, he found his countrymen divided by fears and animosities. He now spent some time at the residence of his brother-in-law Sir John Scot of Scotstarvet, a learned man, and an encourager of learning. Having continued in a state of celibacy till the age of forty-seven, he in 1632 married Elizabeth Logan; a lady in whom he traced a strong resemblance to his first mistress. She is commonly represented as the grand-daughter of Sir Robert Logan of Restalrig; but, according to Hay, her father, who was altogether unconnected with that family, was minister of Edleston in the county of Peebles, and her mother was the daughter of a shepherd.[4] Of this marriage there were five sons and four daughters. John, the eldest son, died in his youth; William was knighted by Charles the Second, and lived to an advanced age;[5] Robert was married, but died about the age of forty without children; the two youngest, Richard and James, died in their infancy. The eldest daughter Elizabeth was married to Dr Henryson, an eminent physician in Edinburgh;[6] but the other three, Margaret, Anabella, and Jane, died very young.[7] The father was a decided

[1] The first edition of his poems has the following title: "Poems, amorous, funerall, diuine, pastorall, in Sonnets, Songs, Sextains, Madrigals. By W. D. the author of the Teares on the Death of Mœliades." Edinbvrgh, printed by Andro Hart, 1616, 4to. Another edition, or the same edition with a new title, bears "Poems, by William Drvmmond of Hawthorne-denne. The second impression." Edinbvrgh, printed by Andro Hart, 1616, 4to.

[2] To this visit another poet of exquisite talents makes the following allusion:

Then will I dress once more the faded bower,
Where Jonson sat in Drummond's classic shade.
COLLINS's Ode to John Home.

[3] Gifford's Memoirs of Jonson, p. cxxx.—This charge has been sufficiently repelled by Sir Walter Scott in his Provincial Antiquities of Scotland, vol. ii. p. 133. See likewise Dr Drake's Mornings in Spring, vol. i. p. 286.

[4] Hay's Memoirs, vol. ii. p. 105. MS. Adv. Lib.

[5] Sir William Drummond is more celebrated for his jovialty than for his literature. See Dr Pennecuik's Poems, p. 49. 52. An honourable instance of his humanity is recorded in the Memoirs of George Brysson, p. 285.

[6] This was probably Henry Henryson, M. D. of Elvingston, whose Latin version of the hundred and fourth psalm occurs in the *Octupla*. Edinb. 1696, 8vo. He is more commonly called Henderson, which is a corruption of the other name. Elizabeth, the heiress of her father Dr Henry Henderson of Elvington, was married to John Clerk of Pennecuik. (Inquisitionum Abbreviatio, vol. i. Haddington, 341.)

[7] Douglas's Baronage of Scotland, p. 573, compared with Sage's Life of Drummond, p. vi.

cavalier, and wielded his pen, though not his sword, in the king's service; and being reputed a malignant, he was exposed to some of the usual molestations of those unhappy times. The tragical fate of his sovereign is said to have hastened his own dissolution: we are informed by Bishop Sage that Drummond, being weakened by hard study and disease, was so overwhelmed with extreme grief and anguish that he died on the 4th of December 1649.[1] But as the king was executed on the 30th of January, an interval of more than ten months must have occurred between his death and that of his faithful subject; an interval so long as to render the biographer's inference somewhat questionable. He had nearly completed the sixty-fourth year of his age. His remains were interred in the church of Lasswade, which stands at the distance of about a mile from Hawthornden. He appears through life to have maintained a character of uniform respectability; uniting with his other qualities that of consistent piety, and blending morality with his devotion. His death was affectionately lamented by his friend Colonel Lauder of Hatton, who has left several other specimens of his poetical talents, and who was not the only Scottish soldier of this period that evinced his love of the Muses.

Drummond was evidently a man of superior talents and accomplishments. We are informed that he was familiarly acquainted with the best Greek and Latin authors: his long residence on the continent afforded him an excellent opportunity of acquiring a knowledge of the living languages; and he is said to have spoken French, Italian, and Spanish, as fluently as his native tongue. To his graver qualifications he added no mean proficiency in music; and he occasionally sought a relaxation from his studies by playing on the lute, "which he did to admiration." He seems to have devoted a considerable portion of his time to the invention or improvement of various instruments and machines, applicable to various purposes of peace or war. They are curiously enumerated, to the extent of sixteen, in a patent which he obtained in the year 1627, and which secured to him the sole right and property within the kingdom of Scotland for the space of twenty-one years.[2]

His literary productions exhibit considerable variety. His compositions in prose chiefly consist of the Cypress Grove, some political tracts, and the History of the five Jameses; a work which embraces the history of Scotland from 1423 to 1542.[3] "The best of Drummond's prose works," says Mr Headley, "is his Cypress Grove, which, though quaint in its style, is worth reading for its vein of dignified morality." His history, which has alternately been the object of extravagant commendation and unsparing censure, cannot now be regarded as a work of much value or interest: the author's materials are not generally drawn from recondite sources, and his manner is too rhetorical. For the reputation which he still retains, Drummond is chiefly indebted, not to his historical, but to his poetical excellence; and, in the opinion of competent judges, he is entitled to a distinguished place among the English poets of that age. As few of his poems extend to a considerable length, his genius cannot be estimated by the success of any great and continued effort; but notwithstanding the shortness of his flights, he generally soars on bright and steady wings. He is conspicuous for his delicate sensibility and warmth of fancy; and with these qualities, so essential in an amatory poet, he unites uncommon skill in versification. His taste seems in a great measure to have been formed upon the Italian model, nor are his compositions entirely free from Italian conceits; but he commonly maintains a degree of elegant simplicity to which few English poets of that age have attained.

The reputation which Drummond enjoyed during his life, appears to have suffered some diminution after his death. He was a gentleman, says Edward Phillips, "who imitating the Italian manner of versifying, vented his amours in sonnets, canzonets, and madrigals, and, to my thinking, in a style sufficiently smooth and delightful; and therefore why so utterly disregarded and layd aside at present, I leave to the more curious palats in poetry."[4] After an interval of more than a century, the same complaint of unmerited neglect was repeated by Mr Headley. "Without ostentatious praise (which is always to be suspected), it is but truth to observe that many of his sonnets, those more especially which are divested of Italian conceits, resemble the best Greek epigrams in their best taste, in that exquisite delicacy of sentiment, and simplicity of expression, for which our language has no single term, but which is known to all classical readers by the word ἀφελεια. It is in vain we lament the fate of many of our poets, who have undeservedly fallen victims to a premature oblivion, when the finished productions of this man are little known and still less read."[5]

Drummond's sonnets form a very considerable proportion of his poetical works. The following four may be selected as a specimen of the entire collection; and they are here exhibited in modern orthography.

I know that all beneath the moon decays,
  And what by mortals in this world is brought,
  In Time's great periods shall return to nought;
That fairest states have fatal nights and days:
I know how all the Muse's heavenly lays,
  With toil of spright which are so dearly bought,
  As idle sounds, of few or none are sought,
And that nought lighter is than airy praise:
I know frail beauty like the purple flower,
  To which one morn oft birth and death affords;
  That love a jarring is of minds' accords,
When sense and will invassal reason's power.
Know what I list, this all cannot me move
But that, O me! I both must write and love.

With flaming horns the Bull now brings the year,
  Melt do the horrid mountains' helms of snow,
  The silver floods in pearly channels flow,
The late-bare woods green anadems do wear;
  The nightingale, forgetting winter's woe,
Calls up the lazy morn her notes to hear;
  Those flowers are spread which names of princes bear,
  Some red, some azure, white, and golden grow.
Here lows a heifer, there bewailing strays
  A harmless lamb, not far a stag rebounds;
The shepherds sing to grazing flocks sweet lays,
  And all about the echoing air resounds.

[1] Sir Thomas Urquhart is said to have expired in a paroxysm of laughter, on hearing of the restoration of Charles the Second; a statement which is rendered sufficiently probable by the record of similar cases, and by the eccentric character of the individual. Aretæus, an ancient physician, specifies unextinguishable laughter as one of the causes of death: γελως ἀσβεστος μεχρι θανατου. (De Causis et Signis Morborum, lib. i. p. 35. edit. Boerhaave. Lugd. Bat. 1735, fol.) And other ancient writers have mentioned the names of different persons who died of excessive joy. (Valerius Maximus, lib. ix. cap. xii. Plinii Hist. Nat. lib. vii. cap. liii.) According to the common account, Sophocles was of this number.

[2] Drummond's Works, p. 235. Edinb. 1711, fol.

[3] Of his History of Scotland, the first edition is that of London, 1655, fol. The introduction was written by Mr Hall of Gray's Inn. There are other three editions.

[4] Phillips's Theatrum Poetarum, or compleat Collection of the Poets, part ii. p. 192. Lond. 1675, 12mo.

[5] Headley's Biographical Sketches (p. xlv.) prefixed to Select Beauties of Ancient English Poetry. Lond. 1787, 2 vols. 8vo.

Hills, dales, woods, floods, and every thing doth change,
But she in rigour, I in love am strange.

Trust not, sweet soul, those curled waves of gold,
With gentle tides which on your temples flow,
Nor temples spread with flakes of virgin snow,
Nor snow of cheeks with Tyrian grain enroll'd;
Trust not those shining lights which wrought my woe,
When first I did their burning rays behold,
Nor voice, whose sounds more strange effects do show
Than of the Thracian harper have been told.
Look to this dying lily, fading rose,
Dark hyacinth, of late whose blushing beams
Made all the neighbouring herbs and grass rejoice,
And think how little is 'twixt life's extremes.
The cruel tyrant that did kill those flowers,
Shall once, aye me! not spare that spring of yours.

What doth it serve to see sun's burning face,
And skies enamell'd with both the Indies' gold,
Or moon at night in jetty chariot rolled,
And all the glory of that starry place?
What doth it serve earth's beauties to behold,
The mountains' pride, the meadows' flowing grace,
The stately comeliness of forests old,
The sport of floods, which would themselves embrace?
What doth it serve to hear the Sylvans' songs,
The wanton merle, the nightingale's sad strains,
Which in dark shades seem to deplore my wrongs?
For what doth serve all that this world contains,
Sith she, for whom those once to me were dear,
No part of them can have now with me here?

To some of his compositions, which he has described as songs, this title is by no means applicable; it is neither applicable to the vein of poetry, nor to the measure of the verse. One striking poem, which he entitles a song, is written in heroic couplets, and contains such passages as this:

And tell me, thou who dost so much admire
This little vapour, smoke, this spark or fire,
Which life is call'd, what doth it thee bequeath
But some few years which birth draws out to death?
Which if thou paragon with lustres run,
And them whose career is but now begun,
In day's great vast they shall far less appear,
Than with the sea when matched is a tear.
But why would'st thou here longer wish to be?
One year doth serve all nature's pomp to see,
Nay, even one day and night: this moon, that sun,
Those lesser fires about this round which run,
Be but the same which, under Saturn's reign,
Did the serpenting seasons interchain.
How oft doth life grow less by living long,
And what excelleth but what dieth young?[1]

His collection of sacred verses, which he entitles Flowres of Sion,[2] contain much poetical imagery and expression. Some of the topics cannot be very safely approached by a poet, who must place his chief reliance on the exercise of his fancy; and the subsequent lines of this writer may sometimes occur to the recollection of his reader:

Who would this Eden force with wit or sense,
A cherubim shall find to bar him thence.

One of the longest poems in this collection, entitled a Hymne on the fairest Faire, contains the following among many other striking passages:

Ah! as a pilgrim who the Alps doth pass,
Or Atlas' temples crown'd with winter's glass,
The airy Caucasus, the Apennine,
Pyrenes cliffs where sun doth never shine,
When he some heaps of hills hath over-went,
Begins to think on rest, his journey spent,
Till, mounting some tall mountain, he doth find
More heights before him than he left behind:
With halting pace so while I would me raise
To the unbounded circuits of thy praise,
Some part of way I thought to have o'er-run,
But now I see how scarce I have begun,
With wonders new my spirits range possest,
And wand'ring wayless in a maze them rest.

It has been suggested by Mr Headley that one would be induced to suppose Pope must have remembered these lines when he wrote a well-known passage in his Essay on Criticism. The subsequent couplet, which occurs in the same hymn, is remarkable for its energetic simplicity:

Uncomprehensible by reachless height,
And unperceived by excessive light.

Another poem of considerable length he entitles the Shadow of the Judgment. It is left in an unfinished state, and is not included in the collection published under the direction of Sir John Scot;[3] but it nevertheless contains many passages worthy of the author's reputation. An elegant critic has remarked that the following verses, describing God moved to wrath, are in Milton's manner:

So seeing earth, of angels once the inn,
Mansion of saints, deflowred all by sin,
And quite confus'd by wretches here beneath,
The world's great sovereign moved was to wrath.
Thrice did he rouse himself, thrice from his face
Flames sparkle did throughout the heavenly place:
The stars, though fixed, in their rounds did quake,
The earth, and earth-embracing sea did shake:
Carmel and Hæmus felt it, Athos' tops
Affrighted shrunk, and near the Ethiops
Atlas, the Pyrenees, the Apennine,
And lofty Grampius, which with snow doth shine.
Then to the synod of the sprights he swore,
Man's care should end, and time should be no more.

Drummond's poem in commemoration of Prince Henry[4] commences in a strain somewhat bombastic, but it contains some elegant and striking passages. The subsequent lines exhibit a very favourable specimen of his versification; and it is proper to recollect that the poem was printed so early as the year 1613. He describes the lamented youth as rejoicing to look down to the azure bars of heaven,

And in their turning temples to behold,
In silver robe the moon, the sun in gold,
Like young eye-speaking lovers in a dance,
With majesty by turns retire, advance.
Thou wonderest earth to see hang like a ball,
Clos'd in the ghastly cloister of this all;

Ὁν οἱ θεοι φιλουσιν ἀποθνησκει νεος.
MENANDRI Fragmenta, p. 48. edit. Meineke.

[2] Flowres of Sion. By William Drvmmond of Hawthorne-denne. To which is adjoyned his Cypresse Groue. 1623, 4to. Edenbovrgh, printed by Iohn Hart, 1630, 4to.

[3] Poems by that most famous wit Mr William Drummond of Hawthornden. . Lond. 1656, 8vo. The editor was Edward Phillips, the nephew of Milton. The same edition was exhibited under a new and fantastic title, with the date of 1659. A more extensive collection of his poems is to be found in the Works of William Drummond of Hawthornden. Edinb. 1711, fol. Bishop Sage's life of the author is prefixed to this publication. But the most complete, as well as the most elegant edition was printed under the superintendence of Mr Maitland: "The Poems of William Drummond of Hawthornden." Edinb. 1832, 4to. The book however is not published: it was the splendid contribution of William Macdowall, Esq. of Garthland to the Maitland Club.

[4] Teares on the Death of Mœliades. Edinbvrgh, printed by Andro Hart, 1613, 4to. His two sonnets and epitaph, which appear in this publication, are likewise inserted in the "Mavsolevm, or choisest Flowres of the Epitaphs, written on the Death of the neuer-too-much lamented Prince Henrie." Edinb. 1613, 4to. A third edition of the "Teares on the Death of Mœliades" soon followed. Edinb. 1614, 4to. The second we have not seen.

And that poor men should prove so madly fond
To toss themselves for a small foot of ground;
Nay, that they even dare brave the powers above,
From this base stage of chance that cannot move.
All worldly pomp and pride thou seest arise
Like smoke, that scatt'reth in the empty skies.
Other hills and forests, other sumptuous tow'rs,
Amaz'd thou find'st excelling our poor bow'rs;
Courts void of flattery, of malice minds,
Pleasure which lasts, not such as reason blinds.

Forth Feasting, a poem written in the year 1617 on the king's visit to his native country,[1] may be considered as his best performance; it abounds with poetical imagery, and the versification possesses uncommon terseness and harmony. In all poems of the same age and denomination, the reader must necessarily expect a certain sprinkling of mythology; this is a prevailing vice, an endemic disease, among the poets of that period; but Forth Feasting is enlivened by an elegant vein of fancy, and contains various passages of distinguished felicity. In the following nervous lines, he pays a warm and not unmerited compliment to the monarch's love of peace:

Now, where the wounded knight his life did bleed,
The wanton swain sits piping on a reed,
And where the cannon did Jove's thunder scorn,
The gaudy huntsman winds his shrill-tun'd horn;
Her green locks Ceres without fear doth dye,
The pilgrim safely in the shade doth lie,
Both Pan and Pales careless keep their flocks,
Seas have no dangers save the winds and rocks:
Thou art this isle's Palladium, neither can,
While thou art kept, it be o'erthrown by man.
Let others boast of blood and spoils of foes,
Fierce rapines, murders, Iliads of woes,
Of hated pomp, and trophies reared fair,
Gore-spangled ensigns streaming in the air,
Count how they make the Scythian them adore,
The Gaditan, the soldier of Aurore;
Unhappy vauntry! to enlarge their bounds,
Which charge themselves with cares, their friends with wounds,
Which have no law to their ambitious will,
But, man plagues, born are human blood to spill:
Thou a true victor art, sent from above,
What others strain by force to gain by love;
World-wand'ring Fame this praise to thee imparts,
To be the only monarch of all hearts.

When the successor of this king visited his northern dominions in the year 1633, Drummond contributed the verses for the pageants which welcomed his arrival in Edinburgh.[2] These verses, although they do not exhibit passages equal to those which we have lately examined, are not destitute of merit. Of the frequent compression and harmony of his couplets, every reader must be sufficiently aware; and the excellence of his versification has been highly extolled by an English critic. Waller and Denham are often regarded as the great improvers of a mode of versification which was carried to greater perfection by Dryden; but the Tears on the Death of Mœliades, and Forth Feasting, were composed several years before either of those poets had reached the age of manhood.[3] J. B—E.

DRUMMOND, *Sir William*, of Logie-Almond, a distinguished scholar, acute philosopher, and accomplished writer, died at Rome, of a lingering and painful disease, on the 29th of March 1828. The date of his birth we have not been able to ascertain, and consequently cannot pretend to determine his age at the time of his decease.

He seems to have been early ambitious of literary distinction, and in 1794 he published *A Review of the Government of Sparta and Athens*, large 8vo; a work which, though not destitute of merit, and exhibiting considerable traces of a vigorous mind, yet gave no promise of that bold spirit of speculation for which its author was afterwards so much distinguished. At the close of the year 1795, he was returned to parliament for the borough of St Mawes, in the representation of which a vacancy had occurred; and in the two following parliaments, which met respectively in 1796 and 1801, he sat for the town of Lostwithiel. At the time of his second election he had been appointed envoy-extraordinary to the court of Naples.

In the year 1798, he published *The Satires of Persius Translated*, 8vo, which happened to appear about the same time with the rival translation of the Roman satirist by Mr Gifford, author of the Baviad and Mæviad, and afterwards editor of the *Quarterly Review*. This translation alone would have been sufficient to fix his reputation as an accomplished classical scholar; and, in point of fact, it has been much admired by all who are competent to appreciate the difficulty of the task which he so successfully performed. It would not be easy, indeed, to overrate the skill with which the niceties of Persius have been discriminated, or the felicity with which the idiomatic peculiarities of that difficult author have been converted into equivalent forms of expression. Drummond's versification is easy, graceful, and precise; and though it wants the piquancy of allusion, the congenial bitterness of spirit, and the occasional point and concentration, which impart so strong a zest to the translation of Mr Gifford, it is yet distinguished for greater freedom and equal fidelity, two things which Drummond has shown that it is not impossible to reconcile.

In the year 1801, Mr Drummond being then ambassador to the Ottoman Porte, was honoured with the order of the Crescent, which was confirmed by license, in the London Gazette, dated the 8th of September 1803.

In 1805 Sir William published his *Academical Questions*, in 4to, and thereby greatly extended his fame as an author. Hitherto he had appeared only in the character of an elegant and accomplished scholar; but in this work he boldly entered the domain of philosophy, and in a free and fearless spirit attacked every species of dogmatism, whether consecrated by time, or sustained by authority, exposing the weakness of the human understanding, and mortifying the pride of pretended wisdom, by a collection of what appear to be insoluble cases and indeterminate problems. In this work, however, it is only the task of demolition which he proposes to accomplish; and it must be owned that he has spread abroad the rubbish and scattered the dust of philosophical systems in a somewhat ap-

[1] Forth Feasting. A Panegyricke to the Kings most excellent Majestie. Edinbvrgh, printed by Andro Hart, 1617, 4to.—This poem occurs in the Muses Welcome, p. 25.

[2] Drummond's verses appeared in a publication entitled "The Entertainment of the high and mighty Monarch Charles, King of Great Britaine, France, and Ireland, into his auncient and royall Citie of Edinbvrgh, the fifteenth of Iune 1633." Printed at Edinbvrgh by Iohn Wreittoun, 1633, 4to. The last work which he himself is known to have published bears the following title: "To the Exequies of the Honovrable Sr Antonye Alexander, Knight, &c. A pastorall Elegie." Edinbvrgh, printed in King James his College, by George Anderson, 1638, 4to. Mr Maitland has reprinted the *Polemo-Middinia* from the earliest edition that has been traced. Edinb. 1684, 4to.

[3] Neve's Cursory Remarks on some of the Ancient English Poets, particularly Milton, p. 49. Lond. 1789, 8vo.—With respect to the supposed merit of Waller and Denham as improvers of English versification, the reader may consult Mr Crowe's Treatise on English Versification, p. 166. Lond. 1827, 8vo.

palling manner. "The author of *Academical Questions*," says the able critic of the work in the *Edinburgh Review*, "is indubitably a person of great reading, and much natural acuteness; but he has taken too wide a range, and indulged somewhat too much in a vein of controversial declamation. He often seems to think more of demolishing his antagonist than of enlightening his reader; and sometimes appears to enlarge upon a topic as much for the display of his eloquence as for the support of his reasoning. By frequent reference to the Greek writers, and continual allusions to the usages of antiquity, he expected perhaps to seduce the scholars of the South into metaphysical investigations, and to engage the attention of polite readers by a certain vivacity and polish in the turn of his expression. If this was his view, however, he certainly ought not to have plunged at first into the great gulf of substance and entity." (*Edinburgh Review*, vol. vii. p. 185.) To these observations, however, it is proper to add, that the author avowedly reserved the full exposition of his own theory for a subsequent volume, though in point of fact it never appeared; and that in this preliminary publication he conceived himself to be only clearing out the foundation on which it was his intention afterwards to build.

In the year 1810, Sir William Drummond, in conjunction with Robert Walpole, Esq. published *Herculanensia*, in 4to, containing archæological and philological dissertations, and a copy of a manuscript found amongst the ruins of Herculaneum; and in 1811 appeared an *Essay on a Punic Inscription found in the Isle of Malta*, royal 8vo; both works of great merit and erudition. Sir William was also an occasional, if not a frequent, contributor to the *Classical Journal;* in which his papers on subjects of antiquity, particularly the zodiac of Denderah, which occupied without exhausting his ingenuity, attracted the general admiration of the learned, if not always on account of their soundness, at least by reason of the acuteness and originality they display, and the resources of learning which the author had always at command for the illustration of his peculiar views. About this time, Sir William Drummond, whose residence at Constantinople had turned his attention to oriental literature, sacred as well as profane, consigned the fruits of his researches and investigations into the historical books of the Old Testament, in his *Œdipus Judaicus.* This singular work was never published, having been printed solely for distribution amongst the author's friends and acquaintance; but as he had caused a considerable impression to be struck off, copies of it soon found their way into the hands of persons connected with the periodical press, and those of others; and, as might have been expected, it was most fiercely attacked. The first onset was made by a churchman of the name of D'Oyly, in *Letters to the Right Hon. Sir William Drummond, in Defence of particular Passages of the Old Testament against his late work entitled "Œdipus Judaicus;"* and the attack was renewed in the *Quarterly Review*, with equal vigour and ability. Whether it was altogether fair thus openly to stigmatize a book which had never been published, we shall not stop to inquire; more especially as the principal cause of regret is, not that it was severely criticised, but that it was ever written, far less printed. In the controversy which thus arose, however, Sir William was overmatched, both in science and in Hebrew, with which D'Oyly and the Reviewer evinced a most intimate acquaintance; and although his reply displayed much ingenuity, no skill could evade, far less destroy, the force of some of the criticisms. The truth is, the allegorical theory which he undertook to establish was taken at second hand from the work of Dupuis; and although the author, notwithstanding all the errors charged against him, brought great stores of learning and erudition to bear upon it, yet the absurdities to which it leads are so glaring, and the consequences which follow from it are so pernicious, that it is surprising Sir William Drummond should not have foreseen the one, or been prudent enough not to hazard the other. The preface, too, though beautifully written, contains observations which nothing can excuse, and irreverences so gross as even to shock persons the least scrupulous about subjects of religion. The profane joke about veal cutlets is worthy only of Mr Thomas Paine, and fit to appear in no work where the ordinary humanities of taste and reason are duly observed.

In 1818 Sir William Drummond published, experimentally we believe, the first part of a poem entitled *Odin*, 4to, the object of which was to embody in verse some of the more striking features of the Scandinavian mythology. The poem, however, did not succeed in attracting public attention, which was then almost exclusively fixed on some of the great masters of song, whose deep voice of inspiration filled the land; and although it contained passages of very considerable power and beauty, it fell into almost immediate oblivion.

But the work on which the reputation of Sir William Drummond as a scholar and antiquary must chiefly rest, is his *Origines, or Remarks on the Origin of several Empires, States, and Cities*, in 3 vols. 8vo. The first volume, embracing the origin of the Babylonian, the Assyrian, and the Iranian empires, appeared in 1824; the second, which is wholly devoted to the subject of Egypt, including the modern discoveries in hieroglyphics, came out in 1825; and the third, which treats of the Phœnicians and Arabia, was published in 1826. It would be exceedingly difficult, by a general statement, or by critical observations apart from details, to convey an accurate idea of the real character and merits of this work; which, with much that is strained, exaggerated, or defective, to say nothing of errors into which the author is sometimes betrayed by the excessive refinements of an ever active ingenuity, is in several respects one of the most remarkable productions of modern times. A principal feature of the *Origines*, though certainly the least obtrusive, is, that here the author labours quietly to build up and fortify the authority of the historical books of the Old Testament, which, in the *Œdipus Judaicus*, he had (probably without intending it) contributed to impair, if not to pull down: whilst by concentrating, as it were, into one focus the various scattered lights of tradition, history, philosophy, science, etymology, and archæology; he has contrived to illuminate many of the darkest passages in the records of the ancient world; to dispel no inconsiderable portion of the obscurity which overshadowed the origin and annals of the great empires of antiquity; and, even in the merest archæological discussions, to interweave incidental illustrations, alike curious in themselves, and valuable to the scholar, the theologian, and the antiquary. Upon this work, therefore, as on a fixed and enduring pedestal, the fame of Drummond as a scholar must in a great measure rest. Besides its other great and singular merits, it has that which indeed is peculiar to almost all Drummond's works, of being written in a pure, chaste, classical style, full of vivacity and vigour, and sometimes even rising into a rich and lofty strain of eloquence. The dialogue between Neomathes and Philothoth, in the second volume, where the one impugns and the other defends the astronomical and mathematical skill of the ancient Egyptians, may be instanced as a specimen of the grace, elegance, and force of Drummond's style, when it flows in a continuous stream, unbroken by the projecting corners and edges of a hard and rugged erudition.

Sir William Drummond's appreciation of the modern discoveries in hieroglyphics (a subject to which three consecutive chapters of the second volume are devoted)

Drummond. Druses.

is, in general, sound and discriminating; and he foresaw sooner than almost any one else, that the powers of the phonetic alphabet, as an instrument of discovery, would be found to have been greatly over-rated. In a letter, dated Naples, 27th April 1827, and addressed to the author of this imperfect notice, he very distinctly shows how fully he had estimated the difficulty which M. Champollion had overlooked, and which now appears to be nearly, if not altogether insuperable. "That M. Champollion's system is accurate to a certain extent," says he, "I admit; and his discoveries do him great honour. Whether he be right in all the details of his system is another question. He establishes the existence of a very great number (I forget the precise number) of phonetic hieroglyphs;[1] and to these, he says, are to be traced all the characters of the running hand, which he reads with so much ease. Now I cannot help observing, that where there are so many signs to represent each alphabetical letter, and where consequently there must have been various contractions for each of these signs in the running hand, the task of learning all these contractions without the aid of a master, and of accurately referring them to their prototypes, must be immense. In Sanscrit there are fifty-two letters, and yet there are above eight hundred contractions. To refer these Sanscrit contractions to their original letters is not always very easy; but the difficulty in Egyptian must have been much greater, in which language the phonetic characters, and consequently the contractions, are far more numerous." Here we have the germ of those principles which, developed and applied by Klaproth to the values of characters as set down by M. Champollion, have made terrible havoc of his discoveries, and left him at last little more than what he took without acknowledgment from Dr Young.

Of Sir William Drummond in his public capacity we are not prepared to speak with any degree of confidence, having little knowledge of his services as a diplomatist, or of his capabilities for acting in that character. The habit of his mind was a cautious or rather tentative boldness, accompanied with perseverance, yet tempered with a conciliating blandness of disposition, and an amenity of manners, native to his character; and it is to be presumed that this prevailing tendency showed itself in the conduct of affairs, as well as in abstract or speculative pursuits. In 1808, we find him, whilst resident at the court of Palermo, ostensibly embarked in a scheme for securing the regency of Spain, which had then just risen in arms to throw off the yoke of France, to Prince Leopold of Sicily. As might have been expected, the project misgave at the very commencement, and Sir William Drummond has not escaped censure for the part he had in it. "Sir William Drummond, the British envoy at Palermo, Mr Viale, and the Duke of Orleans," says Colonel Napier," were the ostensible contrivers of this notable scheme, by which, if it had succeeded, a small party in a local junta (that of Seville) would have appointed a regency for Spain, paved the way for altering the laws of succession in that country, established their own sway over the other juntas, and created interminable jealousy between England, Portugal, and Spain; but with whom the plan originated does not very clearly appear. Sir William Drummond's representations induced Sir Alexander Ball to provide the ship of war, nominally for the conveyance of the Duke of Orleans [since king of the French, who had made no secret of his intention to negociate for the regency of Spain], but in reality for Prince Leopold, with whose intended voyage Sir Alexander does not appear to have been made acquainted. That the prince should have desired to be regent of Spain was natural; but that he should have been conveyed to Gibraltar in a British ship of the line, when the English government disapproved of his pretensions, was really curious. Sir William Drummond could scarcely have proceeded such lengths in an affair of so great consequence, without secret instructions from some member of his own government; yet Lord Castlereagh expressed unqualified approbation of Sir Hew Dalrymple's decisive conduct upon the occasion." (Napier's *History of the Peninsular War*, vol. i. p. 177.) In politics Sir William Drummond appears to have known his ground well, and to have given entire satisfaction to the governments which employed him, at periods of no ordinary difficulty, in transacting affairs of the greatest importance.

Such is an imperfect outline of the literary and political character of this distinguished person. In private life he was a man of modest, retiring, unobtrusive manners, perfectly unconscious that he differed from or had any claims to distinction superior to the most ordinary and commonplace person who fell in his way. Throughout his whole life he was a close and assiduous student, often preferring the company of his books to the promiscuous and frivolous intercourse of company; and hence he was sometimes considered as eccentric, if not cold, distant, and haughty, by those who neither knew nor could sympathise with the habits which are gradually formed by a studious and contemplative life; habits which continue unconsciously to grow upon men whose days and nights are devoted to the pursuit of knowledge. But he was, nevertheless, one of the kindest, mildest, and most generous and humane men that ever existed. To his tenants and dependents he was indulgent even to the injury of his own private fortune; to his friends he was most stedfastly and fervently devoted. In him rising merit was always sure to find a ready and active patron; and not a few individuals have owed their establishment and success in life to the circumstance of having attracted his notice, or of being pointed out to him as deserving of support or encouragement. Latterly, owing to the precarious state of his health, which made it necessary for him to resort to a warmer climate, he resided almost constantly abroad; chiefly, we believe, at Naples, where he continued to indulge in those learned pursuits which formed the main solace and delight of his life. (J. B—E.)

DRUNKENNESS, or INTOXICATION, a well-known vice, the consequence of an excessive use of spirituous liquors, wines, or drugs. Drunkenness is gradually produced, and several distinct stages may be traced in its progress. The sensations experienced in the earlier stages, or the state of incipient intoxication, are peculiarly pleasurable. The mind becomes unusually excited; a soft serenity steals over it, inducing a spirit of universal contentment; gaiety and warmth kindle at the heart, and images of beauty expand before the imagination. In this state, before consciousness is attacked, or the sensorium affected, some of the faculties of the soul act with greater liveliness and vigour, and the feelings of strength and courage are increased. In a short while the sense of propriety is lost, the soul begins to open itself and pour forth its secrets, displaying all the peculiarities of temper, good or bad. Gradually the scene thickens, and consciousness becomes still more weakened. Reason vacates her throne, and grotesque conceptions crowd upon the fancy. Dizziness attacks the brain, and surrounding objects, seeming to lose their balance—

[1] About *a hundred and forty;* whilst, even by the lowest estimate, the total number of hieroglyphs on the monuments exceeds *eight hundred.*

Drunkenness.

Into strange vagaries fall,
As they would dance.

The drunkard begins to feel the earth unsteady beneath his feet, his sense of equilibrium gives way, and total insensibility succeeds, in which a state of stupor, wild dreams, and horror, strongly contrasts with that of previous excitement. Different individuals are differently affected by the inebriating liquid. The state of the passions at the period of indulging in strong liquors also operates powerfully in modifying its effects. Persons under sentence of death, and immediately before execution, have been known to swallow with impunity draughts of the strongest alcohol, which, under other circumstances, would have rendered them senseless. Hence the remarkable propriety of the language put into the mouth of Lady Macbeth previously to the contemplated murder, when, alluding to the manner in which she had "drugged the possets" of the grooms, she says, "that which hath made them drunk hath made me bold." In some persons constitutional moroseness and melancholy are dispelled; in others their habitual gloom is aggravated. Cases of the latter description, however, are by no means so numerous as those of the former, and the general effect of indulgence in "thick potations" is to dispel the clouds of care, at least for the time being. But the re-action which eventually follows over-excitement serves to deepen the darkness, and, by a dispensation of retributive justice, to inflict certain punishment for the previous delinquency. Drunkards who are of a sanguineous temperament are most intensely excited by the use of strong liquors.

It is unnecessary to enumerate the various inebriating agents, which, as well as temperament, influence the nature of the intoxication produced. Thus ebriety from ardent spirits differs from that generated by malt liquors. Besides alcohol, which is the intoxicating principle in all liquors, there are various substances taken, both in the solid and fluid state, which induce intoxication. The most remarkable are opium, bang, and nitrous oxide gas. The former, it is well known, is in extensive use for this purpose in the East, but the latter has not yet been employed out of the laboratory of the chemist. The effects produced by this gas are described by the discoverer, Sir Humphry Davy, and others who have experienced them, as very delightful, and similar to those felt during the earlier stages of intoxication from wine, but of a purer and more ethereal nature.

Amongst the physiological effects of drunkenness are vertigo, double vision, staggering and stammering, heat and flushing, ringing in the ears, and other analogous affections. Vertigo, though partly produced by the ocular delusions under which the drunkard labours, seems principally to arise from the close sympathy which subsists between the brain and the nerves of the stomach. Double vision is readily accounted for by the influence of increased circulation in the brain upon the nerves of sight. Staggering and stammering may likewise be explained by the disordered state of the nervous system. Heat and flushing result from the strong determination of blood to the surface of the body, and ringing in the ears particularly from the throbbing of the internal carotid arteries, which run in the immediate neighbourhood of the ear. The mental pleasure arising from intoxication is not so easily explained, though the primary cause no doubt is physical or rather nervous excitement gradually superinduced, and thus stimulating both the imagination and the passions. The evil consequences of drinking, both in a physical and moral point of view, are numerous and distressing. On the unhappy victim of this propensity a long train of bodily diseases and infirmities are entailed. The liver, stomach, brain, kidneys, indeed all the functions of the body, are seriously impaired by the practice; and in this state the frame is not only more liable to attacks of disease, but when they do come they are likely to exhibit tenfold inveteracy. Thus life is either suddenly shortened, or protracted into a long disease. Death itself is frequently an immediate consequence of over indulgence. We shall not attempt a classification of the bodily infirmities and pernicious effects which drunkenness produces; but we may mention madness, and spontaneous combustion of the body, as belonging to the number. The former is by no means a rare occurrence, and there are well authenticated cases of the latter. Drunkenness in a judicial point of view is not punishable by our laws; but acts of violence committed under its influence are held to be aggravated rather than otherwise; nor can the accused allege it as an extenuation of the crime of which he has been guilty. In proof of this it may be stated, that a bond signed in a fit of intoxication holds good in law, and is perfectly binding, unless it can be shown that the person who signed it was inebriated by the collusion or contrivance of those to whom the bond was given.

Drunkenness has been known from the earliest ages. Wherever the grape flourished inebriation soon made its appearance. It has greatly varied at different times and amongst different nations. There can be no doubt that in a rude, uncivilized state of society, it prevails to the greatest extent, and assumes the most revolting forms. It is also found to exist more extensively in northern than in southern latitudes, owing no doubt to the difference of climate. As society is refined, the vice certainly diminishes amongst the higher orders, although amongst those in the lower ranks it is still found to exist to a fearful extent. For checking this demoralizing practice various moral engines have been set to work, but without a success commensurate with the philanthropy of the design or the importance to society of the anticipated results. (J. F. S.)

Druses.

DRUSES, an independent people of Palestine, of warlike habits, who inhabit the mountains of Libanus, Anti-Libanus, and all the coast from Gibail to Saide, and east as far as Balbec. There are various conjectures concerning the origin of this singular race; the most rational of which is, that they were originally a persecuted sect of Mahommedans, who, flying from oppression, took refuge, about the commencement of the eleventh century, amongst the mountains of Lebanon, and there formed an independent society.

The unity of the Mahommedan faith was at a very early period broken by contending sectaries; and, according to the full and accurate details of Volney, from whom the following account is chiefly compiled, Egypt, under the influence of these delusions, became, in the reign of the third caliph of the race of the Fatimites, and in the year of the Hegira 386 (A. D. 996), the theatre of the most extravagant enthusiasm and absurdity ever perhaps recorded in history. This prince, called Hakem-b'amr-ellah, was remarkable for his heresies and fanatical zeal. He caused the first caliphs, the companions of Mahommed, to be cursed in the mosques, and afterwards revoked the anathema; he compelled the Jews and Christians to abjure their religion, and then permitted them to resume it; he forbade the pilgrimage to Mecca, fasting, and the five prayers; and at length carried his madness so far as to desire to pass for God himself. This impious pretension was supported by a false prophet, who came from Persia into Egypt, and who, to ingratiate himself with Hakem, maintained that this caliph was God himself incarnate. But unluckily for the prophet, his new god had not the power to protect him from the fury of his enemies, who slew him in a tumult almost in the arms of the caliph, who was himself massacred soon afterwards on Mount

Mokhattam, where, as he said, he had held conversation with angels.

The death of these two chiefs did not stop the progress of their opinions. A disciple of Mohammed-ben-Ismael, named Hamzu-ben-Ahmud, propagated them with indefatigable zeal in Egypt, in Palestine, and along the coast of Syria, as far as Sidon and Berytus. But his proselytes being persecuted by the sect in power, took refuge in the mountains of Lebanon, where they were better able to defend themselves; and shortly after this era we find them established there, and forming an independent society.

The difference of their opinions naturally disposes them to be enemies, but the urgent interest of their common safety forces them to allow mutual toleration; and they have always appeared united, and have jointly opposed, at different times, the Crusaders, the sultans of Aleppo, the Mamelukes, and the Ottomans. The conquest of Syria by the latter made no change in their situation. Selim I. on his return from Egypt, meditating no less than the conquest of Europe, disdained to waste his time before the rocks of Lebanon. Soliman II. his successor, incessantly engaged in important wars, either with the knights of Rhodes, the Persians, the kingdom of Yemen, the Hungarians, the Germans, or the emperor Charles V. had no time to think of the Druses. Emboldened by this inattention, and not content with their own independence, they frequently descended from their mountains to pillage the Turks. The pashas in vain attempted to repel these inroads; for their troops were invariably routed or repulsed. But about the year 1588 they were at last subdued by Amurath III., to whom they became tributary, and under whose powerful sway the anarchy by which the country was distracted under its different chiefs was put an end to; and one head or chief was established, who was invested with the executive power, and who was made liable to the sultan for the stipulated tribute, which he was to collect as he best could from the people. The whole power and resources of the country being by this conquest or revolution concentrated under one head, the Druses were engaged in continual warfare and in marauding hostilities with the Turks; and towards the middle of the seventeenth century they had attained to the height of their power under the celebrated emir Fakir-el-din or Fakardin. This chief extended his conquests, and at length became so formidable that he excited the terror of the sultan, who resolved to make an effort for his destruction. To avert the threatening storm he embarked for Italy to solicit succours from the court of the Medici, at Florence, where he remained for nine years. On his return he found every thing prosperous under the wise government of his son Ali. But this prince was afterwards defeated in a battle with the Turks; and Fakir-el-din himself being compelled to take refuge in the mountains, was betrayed into the hands of the Turks by his companions, and by the orders of Amurath he was strangled at Constantinople in the year 1631.

After the death of Fakir-el-din, the posterity of that prince still continued in possession of the government, though at the pleasure, and as vassals, of the Porte. But as this family failed in the male line at the beginning of the last century, the authority devolved, by the election of the scheiks, on the house of Shelah. The only emir of that house whose name deserves to be preserved, is Melhem, who reigned from 1740 to 1759; in which interval he retrieved the losses of the Druses, and restored them to that consequence which they had lost by the defeat of Fakir-el-din. Towards the end of his life, about the year 1754, Melhem, wearied with the cares of government, abdicated his authority, to live in religious retirement, after the manner of the Okkals; but the troubles which succeeded forced him once more to resume the reins of government, which he held till 1759, when he died universally regretted.

He left three sons, minors, the eldest of whom ought, according to the custom of the country, to have succeeded him; but being only eleven years of age, the authority devolved on his uncle Mansour, agreeably to a law very general in Asia, which provides that the people shall be governed by a sovereign who has arrived at years of maturity. The young prince was but little fitted to maintain his pretensions; but a Maronite, named Sad-el-kouri, to whom Melhem had intrusted his education, took this upon himself. Aspiring to see his pupil a powerful prince, that he might himself become a powerful vizir, he made every exertion to advance his fortune; and accordingly entered into a great many plots and intrigues, in which he succeeded by means of an emir of the name of Yussuf in subverting his authority. We have no exact or accurate information of the internal state of this country, or of the domestic agitations and wars by which it has since been distracted. Nor would the detail of these petty wars, however ample or correct, possess any peculiar interest. The country is ruled by an emir, who is considered as the vassal of the Turks.

In their religion the Druses have very peculiar tenets and observances. They practise neither circumcision, nor prayers, nor fasting; they observe neither festivals nor prohibitions. They drink wine, eat pork, and allow marriage between brothers and sisters, though not between fathers and children. From this we may conclude, with reason, that the Druses have no religion; yet one class of them must be excepted, whose religious customs are very peculiar. Those who compose it are to the rest of the nation what the initiated were to the profane. They assume the name of *Okkals*, or spiritualists, and bestow on the vulgar the epithet of *Djahel*, or ignorant. They have various degrees of initiation, the highest orders of which require celibacy. These are distinguished by the white turban, which they affect to wear as a symbol of their purity; and so proud are they of this supposed purity, that they think themselves sullied by even touching a profane person. If you eat out of their plate, or drink out of their cup, they break them; and hence the custom, so general in this country, of using vases with a sort of cock, which may be drank out of without touching them with the lips. All their practices are enveloped in mysteries. Their oratories stand alone or detached, and are constantly situated on eminences; in these they hold their secret assemblies, to which women are admitted. It is believed that they perform ceremonies there in presence of a small statue resembling an ox or a calf; and hence some have pretended to prove that they are descended from the Samaritans. But besides that the fact is not well ascertained, the worship of the ox may be deduced from other sources.

The rest of the Druses, strangers to this spirit, are wholly indifferent about religious matters. The Christians who live in their country pretend that several of them believe in the metempsychosis, and that others worship the sun, moon, and stars. All this is possible; for every one, left to his own fancy, follows the opinion which pleases him most; and these opinions are those which present themselves most naturally to unenlightened minds. When among the Turks, they affect the exterior of Mahommedans, frequent the mosques, and perform their ablutions and prayers. Among the Maronites, they accompany them to church, and, like them, make use of holy water. Many of them, importuned by the missionaries, suffer themselves to be baptized; and if solicited by the

 Turks, receive circumcision, and conclude by dying neither Christians nor Mahommedans. But they are not so indifferent in matters of civil policy.

The Druses may be divided into two classes: the common people; and the people of eminence and property, distinguished by the title of scheiks and emirs, or descendants of princes. The greater part are cultivators, either as farmers or proprietors; and every man lives on his inheritance, improving his mulberry trees and vineyards. In some districts they grow tobacco, cotton, and some grain; but the quantity of these is inconsiderable. It appears that at first all the lands were, as formerly in Europe, in the hands of a small number of families. But in order to render them productive, the great proprietors were forced to sell part of them, and let leases; which subdivision has become the chief source of the power of the state, by multiplying the number of persons interested in the public welfare. There still exist, however, some traces of the original inequality, which even at this day produces pernicious effects. The great property possessed by some families gives them too much influence in all the measures of the nation; and their private interests have too great weight in every public transaction. Their recent history affords sufficient proofs of this, since all the civil or foreign wars in which they have been engaged have originated in the ambition and personal views of some of the principal families, such as the Lesbeks, the Djambelats, and the Ismaels of Solyma. The scheiks of these houses, who alone possess one tenth part of the country, procured retainers by means of their money, and at last involved all the Druses in their dissensions. It must be owned, however, that possibly to this conflict between contending parties the whole nation owes the good fortune of never having been enslaved by its chief.

This chief, called *Hakem* or governor, and also *Emir* or prince, is a sort of king or general, who unites in his own person the civil and military powers. His dignity is sometimes transmitted from father to son, sometimes from one brother to another; and the succession is determined rather by force than by any certain laws. Females can in no case pretend to this inheritance. They are already excluded from succession in civil affairs, and consequently can still less expect it in political. In general the Asiatic governments are too turbulent, and their administration renders military talents too necessary, to admit of the sovereignty of women. Among the Druses, the male line of any family being extinguished, the government devolves to him who is in possession of the greatest number of suffrages and resources. But the first step used to be to obtain the approbation of the Porte, of whom he became the vassal and tributary. It even happens, that, not unfrequently, to assert its supremacy, it names the Hakem, contrary to the wishes of the nation, as in the case of Ismael Hasbeya, raised to that dignity by Djezzar; but this constraint lasts no longer than it is maintained by the violence which gave it birth. The office of the governor is to watch over the good order of the state, and to prevent the emirs, scheiks, and villages, from making war on each other; and in case of disobedience, he may employ force. He is also at the head of the civil power, and he names the cadis, reserving to himself the power of life and death. He collects the tribute, from which he annually pays to the pasha a stated sum. This tribute, which is called *miri*, is imposed on the mulberry trees, vineyards, cotton, and grain. All sown land pays in proportion to its extent; every foot of mulberries is taxed at three medins, or three sols nine deniers (not quite twopence). A hundred feet of vineyard pays a piastre, or forty medins; and fresh measurements are often made to preserve a just proportion. The scheiks and emirs have no exemption in this respect; and it may truly be said that they contribute to the public stock in proportion to their fortune. The collection is made almost without expense. Each man pays his contingent at Dair-el-kamar, if he pleases, or to the collectors of the prince, who make a circuit round the country after the crop of silks. The surplus of this tribute is for the prince; so that it is his interest to reduce the demands of the Turks, as it would likewise be to augment the impost. But this measure requires the sanction of the scheiks, who have the privilege of opposing it. Their consent is necessary, likewise, for peace and war. In these cases, the emir must convoke general assemblies, and lay before them the state of his affairs. There every scheik, and every peasant who has any reputation for courage or understanding, is entitled to give his suffrage; so that this government may be considered as a mixture of monarchy, aristocracy, and democracy. Every thing indeed depends on circumstances. If the governor be a man of ability, he is absolute; if he be weak, he is a cipher. This proceeds from the want of fixed laws; a want common to all Asia, and the radical cause of all the disorders in the governments of the Asiatic nations.

Neither the chief nor the individual emirs maintain troops; they have only persons attached to the domestic service of their houses, and a few black slaves. When the nation makes war, every man, whether scheik or peasant, able to bear arms, is called upon to march. He takes with him a little bag of flour, a musket, some bullets, a small quantity of powder made in his village, and repairs to the rendezvous appointed by the governor. If it be a civil war, as sometimes happens, the servants, the farmers, and their friends, take up arms for their patron, or the chief of their family, and repair to his standard. In such cases, the parties irritated frequently seem on the point of proceeding to the last extremities; but they seldom have recourse to acts of violence, or attempt the death of each other. Mediators always interpose, and the quarrel is appeased the more readily, as each patron is obliged to provide his followers with provisions and ammunition.

The Druses are noted for their hospitality. Whoever presents himself at their door in the quality of a suppliant or passenger, is sure of being entertained with lodging and food in the most generous and unaffected manner. Volney often saw the lowest peasants give the last morsel of bread they had in their houses to the hungry traveller; and when it was observed to them that they wanted prudence, their answer was, "God is liberal and great, and all men are brethren." There are, therefore, no inns in their country any more than in the rest of Turkey. When they have once contracted with their guest the sacred engagement of bread and salt, no subsequent event can make them violate it. Various instances of this are related which do honour to their character. A few years ago an aga of the janissaries having been engaged in a rebellion, fled from Damascus and retired among the Druses. The pasha was informed of this, and demanded him of the emir, threatening to make war on him in case of refusal. The emir demanded him of the scheik Talhouk, who had received him; but the indignant scheik replied, "When have you known the Druses deliver up their guests? Tell the emir, that as long as Talhouk shall preserve his beard, not a hair of the head of his suppliant shall fall."

In consequence, says Volney, of their prejudices, the Druses do not choose to make alliances out of their own families. They invariably prefer their relation, though poor, to a rich stranger; and poor peasants have been known to refuse their daughters to merchants of Saide and Bairout, who possessed from twelve to fifteen thousand piastres. They

observe also, to a certain degree, the custom of the Hebrews, which directed that a brother should espouse his brother's widow.

In short, the proper and distinctive character of the Druses is a sort of republican spirit, which gives them more energy than any other subjects of the Turkish government, and an indifference for religion, which forms a striking contrast with the zeal of the Mahommedans and Christians. In other respects, their private life, their customs and prejudices, are the same with those of other orientals. They may marry several wives, and repudiate them when they choose; but, except by the emir and a few men of eminence, that is rarely practised. The women are all veiled, so that no man knows the face of any other woman than his wife, his mother, his sister, and sisters-in-law. Every man lives in the bosom of his own family, and goes little abroad. The women, those even of the scheiks, make the bread, roast the coffee, wash the linen, cook the victuals, and perform all domestic offices. The men cultivate their lands and vineyards, and dig canals for watering them. In the evening they sometimes assemble in the court, the area, or house of the chief of the village or family. There, seated in a circle, with legs crossed, pipes in their mouths, and poniards at their belts, they discourse of their various labours, the scarcity or plenty of their harvests, peace or war, the conduct of the emir, or the amount of the taxes; they relate past transactions, discuss present interests, and form conjectures on the future. Their children, tired with play, come frequently to listen. This is the only education of those who are termed the Ignorant.

This account of the character, manners, and religious tenets of the Druses has been corroborated by modern travellers. The reverend Mr Connor, a missionary and travelling agent of the British and Foreign Bible Society, mentions that there are many sects among them; but that they are divided into two great classes, that of the Okkals or the Intelligent, who to the number of 10,000 form the sacred order; and the Djahels or Ignorant. It is stated to be extremely difficult to learn any thing satisfactory respecting the religious creed of this people. It is generally agreed that they believe in the transmigration of souls; and according to the character of the individual in his journey through life, will be the nature of the body which his soul will animate in a future state of existence. If his conduct has been fair and honourable, his soul will vivify the body of some respectable character in life. But if his conduct has been evil, his soul will enter the body of a horse, a mule, or an ass. In like manner it is believed that persons of eminent and conspicuous virtue will, as the highest recompense of their merit, pass after death into the bodies of Chinese Druses. In the schools, which are frequent among the Druses, the Okkals are generally the masters, and are paid by the pupils. They teach reading and writing, and the book generally used is the Koran. In some villages where there are Christian schools, the Druses send their children thither, where they are taught to read the Psalms of David. There are no Christians among the Druses, though the emir with his family and some of the other nobles have their children baptized, have chapels in their houses, and hear mass on Sunday, not from any rational belief in the truths of Christianity, but for the same reason that, though they dislike the Mahommedans generally, and entertain no tenet in common with their faith, yet many of them, as we learn from Buckingham, are infected with their customs, and keep the feast of Ramadan with as much rigour as the most orthodox follower of the Arabian prophet; just as the Mussulmans of India, though they despise and hate the Hindus, have nevertheless adopted many of their superstitions and ceremonies.

The Djahels or the Ignorant, who form by far the most numerous class, perform no religious rites whatever, unless when they are obliged by circumstances to assume the appearance of Mahommedans. They cherish an equal dislike to the Christians and Turks; and believe that the deity was incarnated in the person of Hakem, caliph of Egypt, and that he will shortly appear again and utterly destroy all his enemies.

The Druses are a restless and enterprising people; they are formidable in irregular war, being brave even to temerity; excellent marksmen, and noted for sudden surprises. The passion of all classes for arms is remarked by every traveller; and Buckingham mentions a keen dispute at which he was present relative to the value of different weapons, in which the sabres of Ispahan and Damascus, and the muskets and pistols of England, were unanimously preferred. They are of industrious habits, devoting their attention to the cultivation of the soil; and the same traveller, who was over all this country, on quitting a Mahommedan village and entering one inhabited by Druses, was struck with the contrast of the superior order and neatness everywhere conspicuous, as well as in the more cultivated state of the land. No great distinction of ranks is preserved among them, scheiks and peasants treating each other with the greatest familiarity. They speak pure Arabic. Soeda, which is the capital of the Eastern Druses, and the residence of their emir or prince, is about two miles westward of the summit of that range of hills which forms the eastern boundary of the plains of the Hauran.

DRUSIUS, or VAN DEN DRIECHE, JOHN, a learned Protestant and eminent critic, was born at Oudenarde, in Flanders, on the 28th June 1550. Being designed for the church, he learned Greek and Latin at Ghent, and philosophy at Louvain; but his father having been outlawed for his religion, and deprived of his estate, they both retired to England, where the son became professor of oriental languages at Oxford. Upon the pacification of Ghent, however, they returned to their own country, and Drusius was appointed professor of the oriental languages at Leyden. From this place he removed to Friesland, and was admitted professor of Hebrew in the university of Franeker; an office which he discharged with great honour till his death, which happened in 1616. His works prove him to have been well skilled in Hebrew and in Jewish antiquities; and in 1600 the states-general employed him, at a salary of four hundred florins a year, to write notes on the most difficult passages in the Old Testament; but being frequently interrupted in prosecuting this undertaking, it was not published until after his death. He carried on an extensive correspondence with the learned in different countries; for, besides letters in Hebrew, Greek, and other languages, there were found amongst his papers upwards of two thousand written in Latin. He had a son, John, who died in England at the age of twenty-one, and was accounted a prodigy of learning.

Drusius, who was a man of real learning, and deserves the encomiums which Simon has bestowed on him, is also favourably mentioned by Bayle, Freher, Meursius, Foppens, Paquot, and others. Paquot states the number of the printed works and treatises of Drusius at forty-eight, and of the unprinted at upwards of twenty. Of the former more than two thirds were inserted in the collection entitled *Critici Sacri, sive Annotata doctissimorum Virorum in vetus et novum Testamentum*, Amsterdam, 1698, in 9 vols. folio, or London, 1660, in 10 vols. folio. Amongst the works of Drusius not to be found in this collection may be mentioned, 1. *Alphabetum Hebraicum vetus*, 1584, 4to; 2. *Tabulæ in Grammaticam Chaldaicam ad usum Juventutis*, 1602, 8vo; 3. An edition of *Sulpitius Severus*, Franeker,

1607, 12mo; 4. *Opuscula quæ ad Grammaticam spectant omnia*, 1609, 4to; 5. *Lacrymæ in obitum J. Scaligeri*, 1609, 4to; and 6. *Grammatica Linguæ Sanctæ nova*, 1612, 4to.

DRYADES, in *Ancient Mythology*, a kind of inferior deities or nymphs who were believed to inhabit groves and woods. They differed from the Hamadryades, the latter being attached to some particular tree, with which they were born, and with which also they died; whereas the former were goddesses of trees and woods in general.

DRYANDER, JONAS, a Swedish naturalist of eminent talents, and a distinguished pupil of the great Linnæus, was born in 1748. His father, a clergyman near Gottenburg, died during the minority, if not the infancy, of his son; in consequence of which the care of the education of the latter devolved on a maternal uncle. This was Dr Lars Montin, a member of the Stockholm Academy, known to the world by several botanical writings, and, amongst others, by an inaugural dissertation on the genus *Splachnum*, published under the presidency of Linnæus, 28th March 1750; and reprinted in the *Amœnitates Academicæ*, vol. ii. 263. The early education of young Dryander, as far as we can learn, was chiefly in the University of Gottenburg; but he afterwards removed to Lund, where he took his degree of master of arts, or doctor in philosophy, under the presidency of Lidbeck, in 1776; on which occasion he published a dissertation, *fungos regno vegetabili vindicans.* He combated the ideas of certain philosophers, who, led by analogy rather than observation and judgment, were disposed to believe that *fungi* might, like corals and corallines, be the production of animals. But though Mr Dryander thus asserted the vegetable nature of these bodies, he subsequently imbibed, from his friend and preceptor Linnæus, an insuperable dislike to their use as food; nor could the most delicate mushrooms of the most luxurious table ever tempt him to overcome this prejudice. We know not at what period he went to study at Upsal, nor how long he remained there. He became for some time domestic tutor to a young Swedish nobleman, after which he visited England, under the patronage of his countryman the well-known Dr Solander, who introduced him to the acquaintance of Sir Joseph Banks; and on the sudden death of Solander in 1782, he succeeded to the place of that eminent man, in the confidence and friendship of his distinguished patron. He was, in like manner, domesticated under the roof of Sir Joseph as his librarian, and continued in that situation as long as he lived. Mr Dryander also held the offices of librarian to the Royal and the Linnæan Societies. He was one of the first founders of the latter in 1788; and took a principal interest in all its concerns, especially in drawing up its laws and regulations, when this society was incorporated by royal charter in 1802. He, moreover, fulfilled the duties of a very active vice-president, till the time of his decease, which happened towards the end of October 1810, in the sixty-third year of his age. His remains were deposited in the vault of St Ann's Church, Soho, the funeral being attended by a number of his friends, principally members of the Linnæan Society.

The acknowledged publications of Mr Dryander on the subject of botany consist of the following dissertations: 1. *An Account of the Genus Albuca*, in the Stockholm *Transactions* for 1784, in Swedish; 2. *Observations on the Genus Begonia*, in the *Transactions of the Linnæan Society*, vol. i. In this essay twenty-one species are determined, with an indication of nine doubtful ones, though the genus was previously supposed to consist of a solitary species only. 3. *On Genera and Species of Plants* which occur twice or three times in Professor Gmelin's edition of Linnæus's *Systema Naturæ; Trans. of Linn. Soc.* vol. ii. These corrections unfortunately extend no farther than the class *Octandria.* Their author intended to have completed them, but other occupations intervened; and the book which was the object of his correction soon fell into absolute neglect, as far as regards botany; insomuch that its errors, however great and numerous, became harmless. 4. *Lindsea, a new Genus of Ferns; Trans. of Linn. Soc.* vol. iii. This genus is distinguished from *Pteris*, by the *involucrum* opening outward. 5. *Botanical Description of the Benjamin Tree of Sumatra*, in the *Phil. Trans.* vol. lxxvii. The tree in question, about which great mistakes had arisen, is here shown to be a species of *Styrax.* This paper has been republished and translated.

The principal works published under the superintendence and correction of the subject of this memoir, were, the *Hortus Kewensis* of Mr Aiton, printed in 1789, and about half the second edition of the same work, interrupted by his death; as well as Dr Roxburgh's *Plants of the Coast of Coromandel*, a splendid and highly valuable publication, for which the world is indebted to the munificence of the East India Company. To both these the critical learning and accuracy of Mr Dryander were most usefully applied, especially in the typographical department. It would be vain to seek for an error in the printing of any thing which had passed through his hands. We have only to regret that the same critical correctness was not extended as a principle to every other department of the works in which he took a part. Had this been the case, the erroneous essential character of *Oldenlandia*, copied in *Hortus Kewensis* from Linnæus and Willdenow, would not have been allowed to contradict the plate and description of Roxburgh, cited underneath. But, above all, various inaccuracies and faults in nomenclature are propagated and confirmed by an authority which Mr Dryander himself never intended to give. He has often assured the writer of this notice, that, had he published in his own name, he would not have adopted such inaccuracies; which is mentioned here to prevent the errors of others being laid to his charge. The popular *Species Plantarum* of Willdenow being the avowed guide, the author of that work must be responsible for matters which it did not come within the scope of the author or editor of the *Hortus Kewensis* to correct. Many subjects, however, are most skilfully elucidated in this publication, as well as in the sequel of its second edition by Mr Brown, and these cannot escape the discrimination of an intelligent reader. Practical botany was but a secondary or occasional pursuit of Mr Dryander, and he had a diffidence of his powers, and a consequent distaste for the technical and descriptive parts of the science. The descriptions he had prepared for Mr Bauer's splendid figures of *Ericæ*, published by Mr Aiton, were readily and even gladly thrown into the fire, on occasion of a difference of opinion respecting the intended title of the work.

The study in which this most acute and correct man found ample scope for the exercise of his talents was bibliography. His *Catalogus Bibliothecæ Historico-Naturalis Josephi Banks*, is a model for all future writers in this line; but a model rather calculated to check than to excite imitation. A work so ingenious in design, and so perfect in execution, can scarcely be produced in any science; so faultless a specimen of typography we have never elsewhere seen. The frank and unvarnished sincerity of Mr Dryander's character was secondary only to his universal and fastidious exactness upon every subject that came under his notice. He could not be a silent witness of the slightest injustice, misrepresentation, or misconception. His impatience of contradiction arose more from the quickness of his penetration into the confusion and inaccuracy of ordinary intellects and charac-

ters, than from any natural severity. All clearness, honesty, and precision himself, he had little indulgence for those who fell short of his standard, and these were the greater part of mankind. On being asked what share Dr Smith had in the composition of the *Flora Græca*, he replied, with a vehemence which startled the inquirer, "Every word!" When teazed, as was too often his lot, by the questions of the heedless and superficial, he never neglected the duties of the office he had undertaken, if he could not always conceal his impatience under their performance. But when the humblest cultivator of real science applied for his assistance, all his stores were laid open; the most condescending liberality graced his conversation; and he was careful that what he communicated should not only be heard but understood. The versatility of his genius and conversation was no less admirable than their exactness. Whether the subject were a question in science, or a point of history; the politics of Europe, or the tittle-tattle of an obscure German court; the literary talents and performances of any distinguished man, or his private transactions; the intrigues for a place at court, a professorship, or a domestic establishment; he was sure to throw some light upon it. Few men were more missed in the circle in which he moved, nor could his place in general society be readily supplied. (J. E. S.)

DRYDEN, JOHN, an illustrious English poet, descended of a respectable family in Huntingdonshire, was born at Aldwincle, in that county, on the 9th August 1631. He was educated under Dr Bushby at Westminster school, whence he removed to Cambridge in 1650, having been elected scholar of Trinity College, of which he appears to have been afterwards a fellow. In his earlier days he gave no extraordinary indications of genius; for even the year before he quitted the university, he wrote a poem on the death of Lord Hastings, which by no means exhibits a presage of that perfection in poetical composition which he was afterwards destined to attain.

On the death of Oliver Cromwell he wrote some "heroic stanzas" to the memory of the Lord Protector; but after the Restoration, being desirous of ingratiating himself with the new monarch, he wrote, first, a poem entitled *Astræa Redux*, and afterwards a panegyric on the king upon the occasion of his coronation. In 1662, he addressed a poem to the lord chancellor Hyde, presented on new year's day; and in the same year he published a satire on the Dutch. In 1668 appeared his *Annus Mirabilis*, or the Year of Wonders, an historical poem, intended to celebrate the Duke of York's victory over the Dutch. These pieces at length obtained him the favour of the crown; and Sir William Davenant having died the same year, 1668, Dryden was appointed to succeed him as poet-laureat and historiographer to Charles II.; and accordingly he entered upon the office, though his patent was not signed until the year 1670. The pension of the two offices was L.200 a year. About this time also his inclination to write for the stage seems first to have evinced itself. For besides his concern with Sir William Davenant in the alteration of Shakspeare's *Tempest*, he in 1669 produced his *Wild Gallants*, a comedy, which met with very indifferent success. Yet the author, not discouraged by its failure, soon published his *Indian Emperor*, which having experienced a more favourable reception, encouraged him to proceed. He did so, and that with so great rapidity, that in the key to the Duke of Buckingham's *Rehearsal* he is recorded to have engaged himself by contract to write four plays in the year; and, indeed, in the years 1679 and 1680 he appears to have fulfilled this obligation. To this unhappy necessity which he lay under are to be attributed all those irregular and bombastic flights, and sometimes even puerile exuberances, for which he has been so severely criticised, and which, in the unavoidable hurry he usually wrote in, it was impossible for him to find time either to lop off or to correct.

In 1675, the Earl of Rochester, whose envious disposition did not allow him patiently to see growing merit meet with its due reward, and who therefore felt chagrined at the just applause with which Dryden's dramatic pieces had been received, was determined if possible to shake his interest at court; and he succeeded so far as to recommend one Crowne, an obscure author, to write a mask for the court, a service which of course belonged to Dryden as poet-laureat. Nor was this the only attack, or indeed the most formidable one, which Dryden's fame drew upon him; for, some years before this, the Duke of Buckingham, a man of licentious character, but of great wit, had severely ridiculed several of our author's plays in his piece called the *Rehearsal*. But though the intrinsic wit which runs through this performance cannot, even at the present day, fail to excite our laughter, yet, as ridicule is not always the test of truth, it ought not to form the standard by which to fix Dryden's poetical reputation, more especially when we consider that the pieces therein ridiculed are not the masterpieces of Dryden; that the very passages burlesqued are frequently, in their original places, much less ridiculous than when thus detached, like a rotten limb, from the body of the work, exposed to view with additional distortions, and divested of that connection with the other parts which gave it not only symmetry, but beauty; and, lastly, that the beauties, which the critic has kept in the back-ground, are infinitely more numerous than the deformities which he has thus industriously brought forth into immediate view.[1]

Dryden, however, did not suffer these attacks to pass with impunity; for in 1679 there appeared an *Essay on Satire*, said to have been written jointly by himself and the Earl of Mulgrave, containing some very severe reflections on the Earl of Rochester and the Duchess of Portsmouth, who, it is not improbable, might have been instrumental in the affront shown to Dryden; and in 1681 he published his *Absalom and Achitophel*, in which the well-known character of Zimri, drawn for the Duke of Buckingham, is certainly severe enough to repay all the ridicule thrown on him by that nobleman in the character of Bayes.[2] The

[1] Dryden affected to despise the satire of the *Rehearsal*, which, however, he must have felt acutely. In the dedication prefixed to his translation of Juvenal and Persius, he observes, speaking of the many lampoons and libels which had been written against him, "I answered not the *Rehearsal*, because I knew the author sat to himself when he drew the picture, and was the very Bayes of his own farce; because also I knew, that my betters were more concerned than I was in that satire; and, lastly, because Mr Smith and Mr Johnson, the main pillars of it, were two such languishing gentlemen in their conversation, that I could liken them to nothing but their own relations, those noble characters of men of wit and pleasure about town." But notwithstanding this affected insensibility, Dryden did not fail to take his revenge, as will be seen in the succeeding paragraph of the text.

[2] Dryden left the story unfinished; and the reason he assigns for doing so is, because he could not prevail upon himself to exhibit Absalom as unfortunate. "Were I the inventor," says he, "who am only the historian, I should certainly conclude the piece with the reconcilement of Absalom to David. And who knows but this may come to pass? Things were not brought to extremity where I left the story; there seems to be yet room left for a composure: hereafter there may be only for pity. I have not so much as an uncharitable wish against Achitophel; but am content to be accused of good-natured error, and to hope, with Origen, that the devil himself may at last be saved. For which reason, in this poem, he is neither brought to set his house in order, nor to dispose o his person afterwards." Nevertheless, a second part of *Absalom and Achitophel* was undertaken and written by Tate, at the reques and under the direction of Dryden, who wrote nearly two hundred lines of it himself.

resentment shown by these peers was, however, different and characteristic. Lord Rochester, who was a coward as well as a man of the most depraved morals, basely hired three ruffians to cudgel Dryden in a coffeehouse; whilst the Duke of Buckingham, in a more open manner, took the task upon himself, and at the same time presented the poet with a purse containing no very trifling sum of money; telling him that he inflicted the beating as a punishment for his impudence, but bestowed the gold as a reward for his wit.

In 1680 was published a translation of Ovid's Epistles in English verse by several hands, two of which, together with the preface, were by Dryden; and in 1682 appeared his *Religio Laici*, designed as a defence of revealed religion, against deists, infidels, *et hoc genus omne.* Soon after the accession of King James II. our author changed his religion for that of the church of Rome, and wrote two pieces in vindication of the Catholic tenets; namely, *A Defence of the Papers written by the late King*, found in his strong box; and the celebrated poem, afterwards answered by Lord Halifax, entitled *The Hind and the Panther*. By this extraordinary step he not only engaged himself in controversy, and incurred much censure and ridicule from the contemporary wits, but on the accomplishment of the revolution, being, by reason of his new religion, disqualified from bearing any office under the government, he was stripped of the laurel, which, to his still greater mortification, was bestowed on Richard Flecknoe, a man for whom he had a most settled aversion. This circumstance occasioned his writing the severely satirical poem called *MacFlecknoe*.

Dryden's circumstances had never been affluent; but being now deprived of this little support, he found himself reduced to the necessity of writing for bread. We consequently find him from this period engaged in tasks of labour as well as genius, namely, in translating the works of others; and to this necessity perhaps our nation stands indebted for some of the best translations extant. In the year when he lost the laurel, he published the life of St Francis Xavier from the French. In 1693 appeared a translation of Juvenal and Persius; in the first of which he had a considerable hand, and of the latter the entire execution. In 1695 was published his prose version of Fresnoy's *Art of Painting;* and in the year 1697 he gave to the world that translation of Virgil's works which still does, and perhaps ever will, hold the first place amongst all attempts of the kind. The smaller pieces of this eminent writer, such as prologues, epilogues, epitaphs, elegies, songs, and the like, are too numerous to be specified here, though now all happily collected in Sir Walter Scott's edition of his works. His last work is what is called his *Fables*, consisting of many of the most interesting stories in Homer, Ovid, Bocaccio, and Chaucer, translated or modernized in the most elegant and poetical manner; together with some original pieces, among which is the Ode to St Cecilia's Day. This last composition, though written in the very decline of the author's life, and at a period when old age and distress had conspired to damp his poetic ardour, and enfeeble the wings of fancy, possesses nevertheless as much of both as would have been sufficient to render him immortal had he never written a single line besides.

Dryden married Lady Elizabeth Howard, the daughter of the Earl of Berkshire, who survived him about eight years, though for the last four of them she was a lunatic, having been deprived of her senses by a nervous fever. By this lady he had three sons; Charles, John, and Henry. After a long life, harassed with the most laborious of all fatigues, that of the mind, and continually rendered anxious by distress and difficulty, he expired on the 1st of May 1701. Dryden had no monument erected to him for several years; a circumstance to which Pope alludes in his epitaph intended for Rowe. Upon this hint Sheffield Duke of Buckingham erected a tomb, for which the following epitaph was originally intended:

> This Sheffield rais'd—the sacred dust below
> Was Dryden once; the rest, who does not know?

But this was afterwards changed into the plain inscription still to be seen on the monument, containing merely the dates of the poet's birth and death, together with the fact of the tomb having been erected by John Sheffield, duke of Buckingham.

Dryden's character has been variously estimated by different writers, some of whom have exalted it by the highest commendation, and others debased it by the severest censure. The latter, however, we must charge to that strong spirit of party which prevailed during the greater part of Dryden's lifetime, and which ought therefore to be taken with great allowances. From some parts of his history, however, he appears to have been unsteady, and to have too readily temporized with the several revolutions in church and state. But this might in some measure have been owing to that natural timidity and diffidence of disposition, which almost all writers seem agreed that he possessed. Congreve, whose authority cannot be suspected, has given us such an account of him as must make him appear no less amiable in his private character as a man, than he was illustrious in his public capacity as a poet. In the former capacity, according to Congreve, he was humane, compassionate, forgiving, and sincerely friendly; of extensive reading, tenacious memory, and ready communication; gentle in the correction of the writings of others, and patient under the reprehension of his own deficiencies; easy of access himself, but slow and diffident in his advances to others; and of all men the most modest and the most easy to be discountenanced in his approaches either to his superiors or to his equals. In the latter the highest testimonies have been borne to his merits by some of the greatest men.

Pope had a very high opinion of Dryden. In a letter to Wycherly he says, "It was certainly a great satisfaction to me to see and converse with a man whom in his writings I had so long known with pleasure; but it was a very high addition to it, to hear you at our very first meeting doing justice to your dead friend Mr Dryden. I was not so happy as to know him; *Virgilium tantum vidi.* Had I been born early enough, I must have known and loved him; for I have been assured, not only by yourself, but by Mr Congreve and Sir William Trumball, that his personal qualities were as amiable as his poetical, notwithstanding the many libellous misrepresentations of them; against which the former of these gentlemen has told me he will one day vindicate him." But what Congreve and Pope have said of Dryden is rather in the way of panegyric than as an exact and impartial character. Other writers, however, have spoken of him with greater moderation, yet probably without doing him any injustice. Thus, according to Felton, "he at once gave the best rules, and broke them, in spite of his own knowledge, and the *Rehearsal.* His prefaces are many of them admirable upon dramatic writings: he had some peculiar notions, which he maintains with great address; but his judgment in disputed points is of less weight and value, because the inconstancy of his temper did run into his thoughts, and mixed with the conduct of his writings, as well as his life." Voltaire describes him as "a writer whose genius was too exuberant, and not accompanied with judgment enough;" and he adds, that "if he, Dryden, had written only a tenth part of the works he left behind him, his character would

have been conspicuous in every part. But," says the philosopher of Ferney, "his great fault is his having endeavoured to be universal." "Perhaps no nation," says Dr Johnson, "ever produced a writer that enriched his language with such a variety of models. To him we owe the improvement, perhaps the completion, of our metre, the refinement of our language, and much of the correctness of our sentiments. By him we were taught 'sapere et fari,' to think naturally and express forcibly. Though Davies has reasoned in rhyme before him, it may be perhaps maintained that he was the first who joined argument with poetry. He showed us the true bounds of a translator's liberty. What was said of Rome adorned by Augustus, may be applied by an easy metaphor to English poetry embellished by Dryden, 'lateritiam invenit, marmoream reliquit;' he found it brick, and he left it marble." The public voice, indeed, has assigned to Dryden the first place in the second rank of our poets; no mean station in a table of intellectual precedency so rich in illustrious names: and it is allowed that, even of the few who were his superiors in genius, none has exercised a more extensive or permanent influence on the national habits of thought and expression. In the following noble passage from an article in the *Edinburgh Review* (vol. xlvii. p. 29), the great attributes of Dryden's character and genius are unfolded with striking vigour of diction and splendour of illustration.

"If Dryden had died before the expiration of the first of the periods into which we have divided his literary life, he would have left a reputation, at best, little higher than that of Lee or Davenant. He would have been known only to men of letters; and by them he would have been mentioned as a writer who threw away, on subjects which he was incompetent to treat, powers which, judiciously employed, might have raised him to eminence, whose diction and whose numbers had sometimes very high merit, but all whose works were blemished by a false taste, and by errors of gross negligence. A few of his prologues and epilogues might perhaps still have been remembered and quoted. In these little pieces, he early showed all the powers which afterwards rendered him the greatest of modern satirists. But during the latter part of his life he gradually abandoned the drama. His plays appeared at longer intervals. He renounced rhyme in tragedy. His language became less turgid, his characters less exaggerated. He did not indeed produce correct representations of human nature; but he ceased to daub such monstrous chimeras as those which abound in his earlier pieces. Here and there passages occur worthy of the best ages of the British stage. The style which the drama requires changes with every change of character and situation. He who can vary his manner to suit the variation, is the great dramatist; but he who excels in one manner only, will, when that manner happens to be appropriate, appear to be a great dramatist; as the hands of a watch which does not go point right once in the twelve hours. Sometimes there is a scene of solemn debate. This a mere rhetorician may write as well as the greatest tragedian that ever lived. We confess that to us the speech of Sempronius in Cato seems very nearly as good as Shakspeare could have made it. But when the senate breaks up, and we find that the lovers and their mistresses, the hero, the villain, and the deputy-villain, all continue to harangue in the same style, we perceive the difference between a man who can write a play and a man who can write a speech. In the same manner, wit, a talent for description, or a talent for narration, may, for a time, pass for dramatic genius. Dryden was an incomparable reasoner in verse. He was conscious of his power; he was proud of it; and the authors of the *Rehearsal* justly charged him with abusing it. His warriors and princesses are fond of discussing points of amorous casuistry, such as would have delighted a parliament of love. They frequently go still deeper, and speculate on philosophical necessity and the origin of evil.

"There were, however, some occasions which absolutely required this peculiar talent. Then Dryden was indeed at home. All his best scenes are of this description. They are all between men; for the heroes of Dryden, like many other gentlemen, can never talk sense when ladies are in company. They are all intended to exhibit the empire of reason over violent passion. We have two interlocutors, the one eager and impassioned, the other high, cool, and judicious. The composed and rational character gradually acquires the ascendency. His fierce companion is first inflamed to rage by his reproaches, then overawed by his equanimity, convinced by his arguments, and soothed by his persuasions. This is the case in the scene between Hector and Troilus, in that between Antony and Ventidius, and in that between Sebastian and Dorax. Nothing of the same kind in Shakspeare is equal to them, except the quarrel between Brutus and Cassius, which is worth them all three.

"Some years before his death, Dryden altogether ceased to write for the stage. He had turned his powers in a new direction, with success the most splendid and decisive. His taste had gradually awakened his creative faculties. The first rank in poetry was beyond his reach, but he challenged and secured the most honourable place in the second. His imagination resembled the wings of an ostrich. It enabled him to run, though not to soar. When he attempted the highest flights, he became ridiculous; but while he remained in a lower region, he outstripped all competitors.

"All his natural, and all his acquired powers, fitted him to found a good critical school of poetry. Indeed he carried his reforms too far for his age. After his death our literature retrograded; and a century was necessary to bring it back to the point at which he left it. The general soundness and healthfulness of his mental constitution, his information, of vast superficies though of small volume, his wit scarcely inferior to that of the most distinguished followers of Donne, his eloquence, grave, deliberate, and commanding, could not save him from disgraceful failure as a rival of Shakspeare, but raised him far above the level of Boileau. His command of language was immense. With him died the secret of the old poetical diction of England, the art of producing rich effects by familiar words. In the following century, it was as completely lost as the Gothic method of painting glass, and was but poorly supplied by the laborious and tesselated imitations of Mason and Gray. On the other hand, he was the first writer under whose skilful management the scientific vocabulary fell into natural and pleasing verse. In this department he succeeded as completely as his contemporary Gibbons succeeded in the similar enterprise of carving the most delicate flowers from heart of oak. The toughest and most knotty parts of language became ductile at his touch. His versification, in the same manner, while it gave the first model of that neatness and precision which the following generation esteemed so highly, exhibited, at the same time, the last examples of nobleness, freedom, variety of pause and cadence. His tragedies in rhyme, however worthless in themselves, had at least served the purpose of nonsense-verses: they had taught him all the arts of melody which the heroic couplet admits. For bombast, his prevailing vice, his new subjects gave little opportunity; his better taste gradually discarded it.

"He possessed, as we have said, in a pre-eminent de-

gree, the power of reasoning in verse; and this power was now peculiarly useful to him. His logic is by no means uniformly sound. On points of criticism he always reasons ingeniously, and, when he is disposed to be honest, correctly; but the theological and political questions which he undertook to treat in verse were precisely those which he understood least. His arguments, therefore, are often worthless; but the manner in which they are stated is beyond all praise. The style is transparent. The topics follow each other in the happiest order. The objections are drawn up in such a manner that the whole fire of the reply may be brought to bear on them. The circumlocutions which are substituted for technical phrases are clear, neat, and exact. The illustrations at once adorn and elucidate the reasoning. The sparkling epigrams of Cowley, and the simple garrulity of the burlesque poets of Italy, are alternately employed in the happiest manner, to give effect to what is obvious, or clearness to what is obscure.

"His literary creed was catholic, even to latitudinarianism, not from any want of acuteness, but from a disposition to be easily satisfied. He was quick to discern the smallest glimpse of merit; he was indulgent even to gross improprieties when accompanied by any redeeming talent. When he said a severe thing, it was to serve a temporary purpose, to support an argument or to tease a rival. Never was so able a critic so free from fastidiousness. He loved the old poets, especially Shakspeare. He admired the ingenuity which Donne and Cowley had so wildly abused. He did justice, amidst the general silence, to the memory of Milton. He praised to the skies the school-boy lines of Addison. Always looking on the fair side of every object, he admired extravagance, on account of the invention which he supposed it to indicate; he excused affectation in favour of wit; he tolerated even tameness for the sake of the correctness which was its concomitant.

"It was probably to this turn of mind, rather than to the more disgraceful causes which Johnson has assigned, that we are to attribute the exaggeration which disfigures the panegyrics of Dryden. No writer, it must be owned, has carried the flattery of dedication to a greater length; but this was not, we suspect, merely interested servility: it was the overflowing of a mind singularly disposed to admiration, of a mind which diminished vices, and magnified virtues and obligations. The most adulatory of his addresses is that in which he dedicates the State of Innocence to Mary of Modena. Johnson thinks it strange that any man should use such language without self-detestation; but he has not remarked, that to the very same work is prefixed an eulogium on Milton, which certainly could not have been acceptable to the court of Charles II. Many years later, when Whig principles were in a great measure triumphant, Sprat refused to admit a monument of John Philips into Westminster Abbey, because, in the epitaph, the name of Milton incidentally occurred. The walls of his church, he declared, should not be polluted by the name of a republican. Dryden was attached both by principle and interest to the court; but nothing could deaden his sensibility to excellence. We are unwilling to accuse him severely, because the same disposition which prompted him to pay so generous a tribute to the memory of a poet whom his patrons detested, hurried him into extravagance when he described a princess distinguished by the splendour of her beauty and the graciousness of her manners.

"This is an amiable temper, but it is not the temper of great men. Where there is elevation of character there will be fastidiousness. It is only in novels and on tombstones that we meet with people who are indulgent to the faults of others and unmerciful to their own, and Dryden at all events was not one of these paragons. His charity was extended most liberally to others, but it certainly began at home. In taste he was by no means deficient. His critical works are beyond all comparison superior to any which had till then appeared in England. They were generally intended as apologies for his own poems, rather than as expositions of general principles; he, therefore, often attempts to deceive the reader by sophistry, which could scarcely have deceived himself. His dicta are the dicta, not of a judge, but of an advocate, and often of an advocate in an unsound cause; yet in the very act of misrepresenting the laws of composition he shows how well he understands them; but he was perpetually acting against his better knowledge. His sins were sins against light: he trusted that what was bad would be pardoned for the sake of what was good; what was good he took no pains to make better. He was not, like most persons who rise to eminence, dissatisfied even with his worst productions. He had set up no unattainable standard of perfection, the contemplation of which might at once improve and mortify him. His path was not attended by an unapproachable mirage of excellence, for ever receding and for ever pursued. He was not disgusted by the negligence of others, and he extended the same toleration to himself. His mind was of a slovenly character; fond of splendour, but indifferent to neatness. Hence most of his writings exhibit the sluttish magnificence of a Russian noble, all vermin and diamonds, dirty linen and inestimable sables. Those faults which spring from affectation, time and thought in a great measure removed from his poems; but his carelessness he retained to the last. If towards the close of his life he less frequently went wrong from negligence, it was only because long habits of composition rendered it more easy to go right. In his best pieces we find false rhymes, triplets in which the third line appears to be a mere intruder, and while it breaks the music, adds nothing to the meaning; gigantic Alexandrines of fourteen and sixteen syllables, and truncated verses for which he never troubled himself to find a termination or a partner.

"Such are the beauties and the faults which may be found in profusion throughout the later works of Dryden. A more just and complete estimate of his natural and acquired powers, of the merits of his style and of its blemishes, may be formed from the *Hind and Panther*, than from any of his other writings. As a didactic poem, it is far superior to the *Religio Laici*. The satirical parts, particularly the character of Burnet, are scarcely inferior to the best passages in *Absalom and Achitophel*. There are, moreover, occasional touches of a tenderness, which affects us more, because it is decent, rational, and manly, and reminds us of the best scenes in his tragedies. His versification sinks and swells in happy unison with the subject, and his wealth of language seems to be unlimited. Yet the carelessness with which he has constructed his plot, and the innumerable inconsistencies into which he is every moment falling, detract much from the pleasure which such various excellence affords.

"In *Absalom and Achitophel* he hit upon a new and rich vein, which he worked with signal success. The ancient satirists were the subjects of a despotic government. They were compelled to abstain from political topics, and to confine their attention to the frailties of private life. They might, indeed, sometimes venture to take liberties with public men,

Quorum Flaminia tegitur cinis atque Latina.

Thus Juvenal immortalized the obsequious senators who met to decide the fate of the memorable turbot. His fourth satire frequently reminds us of the great political

poem of Dryden; but it was not written till Domitian had fallen, and it wants something of the peculiar flavour which belongs to contemporary invective alone. His anger has stood so long, that though the body is not impaired, the effervescence, the first cream, is gone. Boileau lay under similar restraints, and, if he had been free from all restraint, would have been no match for our countryman.

"The advantages which Dryden derived from the nature of his subject he improved to the very utmost. His manner is almost perfect. The style of Horace and Boileau is fit only for light subjects. The Frenchman did indeed attempt to turn the theological reasonings of the Provincial Letter into verse, but with very indifferent success. The glitter of Pope is cold: the ardour of Persius is without brilliancy. Magnificent versification and ingenious combinations rarely harmonize with the expression of deep feeling. In Juvenal and Dryden alone we have the sparkle and the heat together. Those great satirists succeeded in communicating the fervour of their feelings to materials the most incombustible, and kindled the whole mass into a blaze at once dazzling and destructive. We cannot indeed think, without regret, of the part which so eminent a writer as Dryden took in the disputes of that period. There was, no doubt, madness and wickedness on both sides; but there was liberty on the one and despotism on the other. On this point, however, we will not dwell. At Talavera the English and French troops for a moment suspended their conflict to drink of a stream which flowed between them. The shells were passed across from enemy to enemy without apprehension or molestation. We, in the same manner, would rather assist our political adversaries to drink with us of that fountain of intellectual pleasure which should be the common refreshment of both parties, than disturb and pollute it with the havoc of unseasonable hostilities.

"*MacFlecknoe* is inferior to *Absalom and Achitophel* only in the subject: in the execution it is even superior. But the greatest work of Dryden was the last, the Ode on St Cecilia's Day. It is the masterpiece of the second class of poetry, and ranks but just below the great models of the first. It reminds us of the Pedasus of Achilles—

ὅς, καὶ θνητὸς ἐὼν, ἕπεθ' ἵπποις ἀθανάτοισι.

By comparing it with the impotent ravings of the heroic tragedies, we may measure the progress which the mind of Dryden had made. He had learned to avoid a too audacious competition with higher natures, to keep at a distance from the verge of bombast or nonsense, to venture on no expression which did not convey a distinct idea to his own mind. There is none of that 'darkness visible' of style which he had formerly affected, and in which the greatest poets only can succeed. Every thing is definite, significant, and picturesque. His early writings resemble the gigantic works of those Chinese gardeners who attempt to rival nature herself, to form cataracts of terrific height and sound, to raise precipitous ridges of mountains, and to imitate in artificial plantations the vastness and the gloom of some primeval forest This manner he abandoned; nor did he ever adopt the Dutch taste which Pope affected, the trim parterres and the rectangular walks. He rather resembled our Kents and Browns, who, imitating the great features of landscape without emulating them, consulting the genius of the place, assisting nature, and carefully disguising their art, produced, not a Chamouni or a Niagara, but a Stowe or a Hagley.

"We are, on the whole, inclined to regret that Dryden did not accomplish his purpose of writing an epic poem. It certainly would not have been a work of the highest rank. It would not have rivalled the Iliad, the Odyssey, or the Paradise Lost; but it would have been superior to the productions of Apollonius, Lucan, or Statius, and not inferior to the Jerusalem Delivered. It would probably have been a vigorous narrative, animated with something of the spirit of the old romances, enriched with much splendid description, and interspersed with fine declamations and disquisitions. The danger of Dryden would have been from aiming too high; from dwelling too much, for example, on his kingdoms of angels, and attempting a competition with that great writer, who in his own time had so incomparably succeeded in representing to us the sights and sounds of another world. To Milton, and to Milton alone, belonged the secrets of the great deep, the beach of sulphur, the ocean of fire, the palaces of the fallen dominations glimmering through the everlasting shade, the silent wilderness of verdure and fragrance where armed angels kept watch over the sleep of the first lovers, the portico of diamond, the sea of jasper, the sapphire pavement empurpled with celestial roses, and the infinite ranks of the cherubim, blazing with adamant and gold. The council, the tournament, the procession, the crowded cathedral, the camp, the guard-room, the chase, were the proper scenes for Dryden.

"But we have not space to pass in review all the works which Dryden wrote. We, therefore, will not speculate longer on those which he might possibly have written. He may, on the whole, be pronounced to have been a man possessed of splendid talents, which he often abused, and of a sound judgment, the admonitions of which he often neglected; a man who succeeded only in an inferior department of his art, but who, in that department, succeeded pre-eminently; and who, with a more independent spirit, a more anxious desire of excellence, and more respect for himself, would, in his own walk, have attained to absolute perfection."

Among the various editions of Dryden's works may be mentioned, the Prose Works, by Malone, 1800, in 4 vols.; the Poetical Works, with notes by Warton, and edited by Todd, 1812, in 4 vols. 8vo; and the whole of his Works, with a Life by the late Sir Walter Scott, Edinburgh, 1808, in 18 vols. 8vo.

DRY ROT,

A MOST destructive, and apparently infectious disease in timber, which, by decomposing the fibres, deprives it of all strength, and in no great length of time reduces it to a mass of dry dust; a circumstance from which it seems to have derived its name, which, perhaps, would better be expressed by that of *sap rot.*

Though this disease must from its nature have been co-existent with timber-trees, it would not seem to have excited much attention, and perhaps was not known, certainly not by its present name, before the middle of the last century; at some period, we rather think, of Sir John Pringle's presidency of the Royal Society of London. But for a long time after this little notice appears to have been taken of it; its ravages being, in all probability, inconsiderable, in comparison with what they have been of late years. Even now, the disease is in fact chiefly confined to modern built houses and modern built ships, and more particularly to the ships of the royal navy. The proximate cause of it has, therefore, rightly enough, as it would seem, been ascribed to the unseasonable state of

Dry Rot.

the timber, when placed in certain situations, and under particular circumstances. It could not fail, in the course of the late long protracted war, to become a matter of general observation, that a more rapid decay than usual had become almost universal throughout the fleet, and especially amongst the newest and most recently repaired ships. Many anxious inquiries were instituted, and experiments made, with the view of ascertaining the real cause of a decay, the further prevention of which was so highly important to the national welfare and security. The alarm was greatly increased when, in 1810, the Queen Charlotte, a first-rate ship of war, shortly afterwards launched at Deptford, was discovered, after a close examination, to have all her upper works infected with the *dry rot;* or, in other words, the ends of most of the beams, carlings, and ledges, the joinings of the planks, &c. were observed to be covered with a mouldy, fibrous, and reticulated crust, and the parts of the timber so covered to be perfectly rotten. All the newspapers and journals of the day were filled with this alarming fact, and in consequence thereof a multitude of *dry rot* doctors proffered their assistance; one having a nostrum for eradicating the disease where it had made its appearance, and another for preventing its further approach. Some of these specifics were expensive and inconvenient, many of them impracticable of application, and most of them futile and objectionable in one way or another. These doctors, in fact, like the physicians for the human body when the seat of the disease is unknown, were labouring altogether in the dark, having no other guide to direct them than their own whims and fancies, each being ignorant of the effect of the respective experiments which they wished to try on this diseased machine.

Alarming progress of.

Treatises on the dry rot.

Since the period in question a number of treatises have been written on the subject, for the prevention and cure of the dry rot in ships and houses; some wild and visionary enough, and others exhibiting the proofs of plain practical good sense, deduced from long observation, or the result of judicious experiment. Of the latter description may safely be mentioned *A Treatise on the Dry Rot in Timber*, written in 1815 by the late Mr Thomas Wade, who died previous to its publication, and whilst employed in making experiments in the dock-yards; and also another *On the Prevention of Timber from Premature Decay*, by Mr Chapman, 1817. *A Treatise on the Dry Rot*, by Mr Bowden of the Navy Office, is in many respects deserving of notice, in as far as the facts and his observations on the management of timber are carried; but he unluckily sets out with a fanciful theory, which, however, is not his own, concerning the generation of *fungi*, and their connection with the dry rot, to which, like most theorists, he endeavours to make all his facts subservient. In Mr M'William's *Essay on the Origin and Operation of the Dry Rot*, published in 1818, we find stuffed into a large quarto almost every theory and every fact gathered from preceding writers, from Aristotle down to Mr Ralph Dodd, civil engineer, who has also published his *Practical Observations on the Dry Rot in Timber;* which work appears to be little more than an advertisement of *A Dry Rot Preventive*, a nostrum which, it would seem, is too valuable to be disclosed, without calling in the doctor that he may get his fee. We have also in print the opinions and the specifics of Mr Gregory, Mr Ogg, and many others of minor note, all of whom profess to explain the cause, to secure the prevention, and to effect the cure of the *dry rot.*

Process of the common rot.

These authors are at variance amongst themselves, whether the *common rot* in timber, and the *dry rot*, be not one and the same disease. A little reflection, however, will, we conceive, lead us to consider them as essentially different, both in the symptoms, the progress, and the causes, though the *effect* of destroying the fibre of the wood is pretty nearly the same. If a post of wood, for instance, be driven into the ground, seasoned or unseasoned, it will speedily begin to decay just at the surface of the ground, or, as it were, between the earth and the air; if driven into the earth through water, as in a pond, the decay will commence at the surface of the water, or, as it is technically expressed, between wind and water, whilst all above water, and all that is constantly immerged in the water, as well as the part in the earth, will remain sound. Thus also a beam of wood let into a damp wall will begin to rot just where it enters the wall; so will wooden bannisters when they are let through the top and foot rails. In these and similar cases the rot begins externally, and its progress is inwards, and is more or less accelerated by the alternate action of wind, heat, and moisture, being *greatest* when the alternatives of exposure to wet and drought are most frequent, and *least* when constantly immersed in water, or constantly preserved in a dry atmosphere. Such we conceive to be the usual process of the *common rot* in wood, and it is evidently occasioned by alternate exposure to the vicissitudes of the weather, to moisture and dryness, to heat and cold.

Process of the dry rot

If the same post be well charred or covered over with a thick coating of paint, or varnish, or tar, no such effect will be produced *externally*, the coating being sufficient to protect it against the action of the weather; but if it should happen to be a green or unseasoned piece of wood so tarred or painted, in no great length of time the wood will be found to have begun to decay *internally*, whilst the outer surface appears uninjured, but at length it will also yield to the disease. If this piece of wood had been placed in a warm cellar or close room where there is little or no circulation of air, and more particularly if the room or cellar were damp, there would be perceived, in no great length of time, a fine mouldy coating spread over its surface, of a brownish yellow or dirty white; and shortly afterwards it would be found, on examination, to resemble in its form and structure some of the beautifully ramified *algæ* or sea weeds; which in process of time would become more compact, the interstices being so completely filled up as to give to the whole mass the appearance and consistence of leather. "At first," says one writer, "its appearance is that of fine fibres running on the surface in endless ramifications, resembling the nervous fibres of leaves; presently the interstices are filled up with a spongy or leather-like substance, assuming the character of that order of cryptogamous plants distinguished by the name of *fungus*."

By Mr Wade the general symptoms of *dry rot* are thus described: "The wood at first swells; after some time it changes its colour, then emits gases which have a mouldy or musty smell. In the more advanced stages of it the mass arises, and cracks in transverse directions. Lastly, it becomes pulverulent, and forms vegetable earth; and generally in some of these stages of decay the different species of fungus are found to vegetate on the mass." (*Treatise on the Dry Rot in Timber*. By Thomas Wade.)

These appearances do not invariably take place, the surface of the diseased timber sometimes remaining unchanged, while the process of rotting is going on within; they are, however, pretty constant. But however sound the surface may be, it will appear, on examining the piece of wood, placed in a situation similar to those above mentioned, that the whole of the interior fibres are decomposed, and become a mass of dust inclosed within a thin external shell. No charring of the surface, no paint, tar, or varnish, will prevent this process from taking place,

when the seeds of the dry rot exist, and are placed in a situation favourable for their growth, though they may prevent the external character of mouldiness from taking place on the surface.

Characteristic difference of the two rots.

The symptomatic difference, then, between the common rot and the dry rot may perhaps be thus defined. *Common rot* is a disease in timber, occasioned by the alternations of the weather acting on its surface, and destroying its fibres externally inwards. *Dry rot* is a disease in timber, occasioned by being shut up in warm, close, and moist situations, the effect of which is to destroy its fibres by a process acting internally outwards.

Causes of the dry rot.

Without stopping to inquire in what manner, and by what agency, chemical or mechanical, or both, the common rot acts on the external fibres of the wood, the effect of alternate exposure to the weather is too well known to require any further proof as to its being the immediate cause. The immediate cause of the dry rot is equally obvious; but the predisposing state of the timber to contract the disease is not so clear a problem. Accordingly, theories without end have been hatched to explain the phenomenon. A writer in a public journal, who has slightly touched on the subject, thus explains it. " It is well known," he observes, " that if a piece of green wood be laid across a fire, the air within, expanded by the heat, will drive out at each extremity a viscous fluid, possessing the property of disposing itself on the surface in reticulated filaments. The same appearance of nervous foliation is not uncommon in the intermediate spaces of the concentric layers of the *alburnum* of wood; and the core or heart of trees, and particularly of the pitch pine, after its passage in the heated hold of a ship, is often enveloped with a membranous corticle, like that which lies immediately beneath the bark. All these appearances are certain indications of the *dry rot;* and they point out, with sufficient clearness, that the *sap*, or principle of vegetation, brought into activity, is the *cause* of the disease; the *effect*, though infinitely more rapid, is the same as that of the common rot. It is still a problem in what manner this sap circulates; but there is no doubt that the tubes and cells of the alburnum, or sap-wood, are filled with it in the spring of the year, and that they are empty in the winter; that it is organized matter, developing itself by heat in all the various forms of new bark, leaves, and branches. The stem of a tree cut down will, on the return of summer, make an effort to push out leaves; a more feeble effort of this organized sap ends in the production of *fungus* only." (*Quarterly Review*, No. 15.)

It is now, we apprehend, pretty well decided, that, like other vegetables, the fungi or mushroom tribe are propagated by seed so minute and numerous as to float about invisibly in the air, and to be carried into all manner of situations. The fine impalpable powder that issues from the common puff-ball, like a column of smoke, will give some idea of the almost inconceivable myriads of minute seeds which it incloses. Of these seeds, though myriads perish, yet others, by a concurrence of accidents, being thrown into proper situations favourable for their growth, reproduce the species. It cannot be supposed that the fibres found in the dung of animals, and particularly of the horse, known by the name of mushroom spawn, and from which our gardeners construct their mushroom beds, are generated spontaneously in the belly of the animal, but that the seeds being devoured with his food, have found that degree of warmth, moisture, and soil, favourable to the development of the future plant; and this plant which the fibres exhibit, by care and cultivation increases and grows to the perfect state of all plants, and throws out above the surface the parts of fructification which we call the mushroom. If it be asked why the dung of a cow, which feeds on the same food with a horse, does not produce the spawn of mushrooms, the only answer to be given is, that it is not a proper nidus for the germination of the seed.

In the same manner may the perfect plant be produced from the seed, carried up into the longitudinal tubes of a growing tree, by the rising of the sap; though it would seem that the process of vegetation in the parasite thus lodged will not commence so long as the vital principle of the sap in the tree remains in activity. Indeed it is pretty evident, from numerous observations, that the process of fermentation is necessary to the growth of all fungi; and this may explain why in the diseased and decayed parts of a tree only are fungi found to grow whilst it is in a living state.

The sap, therefore, may be the *cause* of the *dry rot*, in as far as it is favourable to the growth of *fungi*, as it would seem to be when in a state of fermentation, though it never can by any process be convertible into this order of cryptogamous plants. But the appearance of fungi, though a frequent, is by no means a constant symptom of *dry rot;* and, therefore, Mr Bowden's definition of dry rot, with his whole doctrine, must fall to the ground. " The *nature* of *dry rot* is a *vegetable substance*," and this substance, he tells us, is fungus. Though not very happily expressed, his meaning is intelligible enough from what follows. " This secretion of nature (the juice of a tree) which was destined to appear in the form of leaves, branches, &c. being diverted from its original intention, assumes a new form from its own native energies. Vegetation commences in the various tubes of the wood, under the form of those fine fibrous shoots which have been already described (as mushroom spawn). It continues to increase in every direction, until, by an extraordinary manifestation, it happily averts the otherwise unforeseen but certain destruction of the vessel. It may confidently be asserted, therefore, that this is the primary, chief, and predisposing cause of *dry rot;* and this opinion may be further confirmed by an inquiry into the nature of the juices and fungi, and the manner in which the timber is affected." (*A Treatise on Dry Rot*, by A. Bowden.)

Mr Bowden having totally mistaken the nature of fungus, by adopting the erroneous principle of the writer in the *Quarterly Review*, labours hard to prove, and with considerable ingenuity, " that dry rot is caused by a vegetative substance, and that it is one of the species of *fungi;*" and this doctrine he illustrates in the case of *spent bark* from the tan-pits, of which he says, " when taken out and exposed to the heat of summer, the juices appear desirous of *obeying the laws of nature;* and being no longer capable of adding to the bulk of a tree, is satisfied with wearing the humble garb of a mushroom;" nay, so enamoured is he with the similarity of oak bark, and fungus, and *tannin*, that " an examination of the fungous coat taken from the end of a timber, would afford a strong presumption, from its exact resemblance to *leather*, that it owes its existence to no other cause than that which communicates such peculiar qualities." Into such absurdities will crude theories sometimes drive their authors.

Mr Wade has sounder notions on the nature of fungi; he knew they possessed the principle of reproduction, and that their seeds, under favourable circumstances, will vegetate; that the proper *nidus* for the reception of certain species of fungus appears to be wood in a state of progressive decomposition, or the remains of wood entirely decomposed; that, however, the effect produced by these plants and decaying timber is reciprocal, the latter furnishing food for the former, while the decomposition of the wood is accelerated by the growth of the fungus, the gaseous and soluble products being taken up by the

Dry Rot. plants, as quickly as these principles are disengaged. The whole tribe of parasitic fungi may, in fact, be considered as the wolves and tigers of the vegetable world, destroying ultimately every plant they fix upon, and most rapidly where the principle of vegetation has ceased to act, and the putrefactive fermentation of the juices has in consequence commenced.

The real efficient cause then of the dry rot, is that of the juices of the timber being brought into a state of putrefaction, occasioned generally by exposure to a moderate degree of heat and moisture in a stagnant atmosphere. "To favour this process," says Mr Wade, "as much as possible, the air and water should not be renewed, as they undergo a decomposition, which takes place very slowly." From the structure of timber being composed longitudinally of an assemblage of pipes or tubes, it is only necessary that one end of a log of wood should be placed in a damp or wet situation, to occasion the moisture to be conveyed to the opposite end by capillary attraction; and hence arises the infectious nature of the disease, which will always spread wherever the moisture finds its way; and even where there is no moisture, it will be created by the filaments of the fungi working their way through the tubes of the dry wood, and carrying it with them. Hence, also, the rapid decay in ships of war, from the great internal heat occasioned by the number of men, the moisture, and the close air. Hence, also, in houses, the *dry rot* always first appears in the lower apartments, where the floors, partitions, skirting-boards, &c. are supplied with moisture from the wet walls on the ground. In the London houses there is generally a room on the basement story, called the housekeeper's room, which is boarded, and carefully covered over with an oiled floor-cloth. In such a room the dry rot is sure to make its appearance. The wood absorbs the aqueous vapour which the oil-cloth will not allow to escape; and being assisted by the heat of the air in such apartments, the decay goes on most rapidly; and, as Mr Wade observes, "if the seed of fungus be present, the plant is developed in all the superfluity of vigour exhibited in a hot-house, where the same means are resorted to, namely, an atmosphere scientifically and artificially heated, and highly charged with aqueous vapour." Timber may, in fact, have the seeds of dry rot within it, and yet by proper treatment be kept sound for a great length of time. Thus ships laden with particular cargoes afford remarkable instances of the effects of such cargoes on their duration. The warm moisture created by a cargo of hemp is communicated to the timber, and promotes a rapid putrefaction. Mr Chapman says, that the ship Brothers, built at Whitby, of green timber, proceeded to Petersburg for a cargo of hemp. The next year it was found on examination that her timbers were rotten, and all the planking, excepting a thin external skin. A lading of cotton is always injurious to the ship, and even teak is affected by a cargo of pepper. The timber which is brought from America in the heated hold of a ship, is invariably covered over, on being landed, with a complete coating of fungus. It was the too general use of this timber in ships of the royal navy that at one time increased the disease to such an alarming degree. Those ships, on the contrary, which are employed constantly in the coal and lime trade, are very durable, and have been known to last for a century. These effects are obviously to be ascribed to the exclusion of air in the one case from, and the free admission of it in the other to, the interior surface of the ship, assisted, in the latter instance, by the absorption of moisture, by the coals and lime, from the timbers and planking.

Prevention of dry rot. If we are arrived at the right conclusion as to the *cause* of *dry rot* in timber, we can be at no loss with regard to the mode of treatment for the *prevention* of the disease. The experiments for this purpose have been very numerous, but may be classed under three general heads; desiccation or seasoning; immersion in earth, sand, or water; and impregnation with some foreign matter, which will resist putrefaction.

by desiccation or seasoning. The most simple and common mode of preventing the decomposition of vegetable matter, is by depriving it of moisture. Various schemes have been put in practice for drying the juices in large logs of timber. Time alone will do it when the wood is placed in favourable situations, that is to say, in a dry atmosphere, and constantly exposed to a free circulation of air; but time will also produce the rot in timber when piled up in stacks in the open air, imbibing moisture from the earth, and exposed to the vicissitudes of the seasons, and the alternatives of weather; scorched at one time by the heat of the sun, at another drenched with rain, and rent and split in every possible way by the freezing of the water which has insinuated itself into the pores and crevices of the wood. It was formerly, and, indeed, till very lately, the practice to let ships of war remain on the stocks *in frame* for two, three, or four years, to *season*, as it was called; but there never was so mistaken a notion. "When a ship," says Mr Wade, "is built, exposed to the weather, the lower part forms a grand reservoir for all the rain that falls; and as the timbers in that part are placed as close together as possible, the wet escapes very slowly. Those timbers are always soaked with moisture, and, to some distance from the keel, exhibit a green appearance; their green matter, when viewed through a microscope, is found to be a beautiful and completely formed moss, which vegetates at the expense of the timber. If to season timber be only to dry it, the sooner it is dried the better; and when completely dry, it cannot too soon be employed in ship-building, when it should be kept dry. It cannot answer any end to have seven years wear out of a ship on the stocks." At length our ship-wrights are convinced of this truth, and the plan now generally adopted in ship-building is to protect the vessel by a roofed structure, with the sides open to admit a free current of air, but to exclude all moisture, as well as the rays of the sun (See DOCK-YARDS); a practice which we have tardily adopted from the Swedes and the Venetians. A new system seems also to have been adopted on the piling the timber stacks. Instead of their being placed on old, useless, and often rotten logs of timber resting on the ground, they are now insulated from the earth on stone or iron pillars; and in place of their surfaces coming in contact with each other, pieces of wood are placed between them so as to admit of a circulation of air. Nothing further appears to be wanting but to protect the tops and the ends of the stocks or piles from the effects of the weather.

Of the various modes of artificial and rapid desiccation, that of charring is perhaps the best; but it is liable to two objections, the first is, that if the surface be completely charred, it diminishes very much the strength of the timber; and, secondly, it the more readily attracts moisture. The juices of timber may be drawn off or hardened by kiln-drying; but this also disturbs the arrangement of the fibres, and deprives the wood of a great part of its strength.

Mr Lukin's experiments for seasoning timber. The experiments made by Mr Lukin for the rapid seasoning of green oak timber, promised at one time much success, but ended in disappointment. He conceived, that if the acid and the watery particles were driven out of a piece of oak timber by some process which should prevent the surface from splitting, the fibres would be brought closer into contact, and whilst the log lost in weight it would gain in strength. With this view he

buried a piece of wood in pulverized charcoal in a heated oven. The log wore a promising appearance; the surface was close and compact; it had lost in its weight and dimensions; but when divided with the saw, the fibres were discovered to have started from each other, exhibiting a piece of fine net-work, resembling the inner bark of a tree.

His next contrivance was to supply the place of the fluids driven out by heat, with some other substance of an oily or resinous nature, which, while it destroyed the principle of vegetation, should preserve the timber in a compact state. For this purpose he erected a large kiln in Woolwich dock-yard, capable of containing from two to three hundred loads of timber. At each end, on the outside, was a retort in which the saw-dust of the pitch-pine was submitted to distillation. From the heads of these retorts were iron pipes, perforated with holes like a cylinder, continued along the upper part of the kiln the whole length in the inside. By this arrangement it was expected, that while the heat of the kiln drove off the aqueous matter of the timber, the product of the saw-dust, which resembled weak oil, or rather spirit of turpentine, would drop through the holes in the tubes upon the logs, and supply its place. But before the process of transfusion was judged to be complete, an explosion took place, which proved fatal to six of the workmen, and wounded fourteen, two of whom shortly afterwards died. The explosion was like the shock of an earthquake; it demolished the wall of the dock-yard, part of which was thrown to the distance of 250 feet; an iron door, weighing 280 pounds, was driven to the distance of 230 feet, and other parts of the building were borne in the air upwards of 300 feet. The experiment was not repeated.

The bad effects of applying artificial heat to the seasoning of green timber were strongly exemplified by a practice introduced very generally into our ships of war which had exhibited indications of the dry rot, particularly in the *Queen Charlotte*. Enormous fires were made in stoves placed in various parts of the ship, and the heat led in tubes to the cavities between the timbers, &c. The consequence of which was, as might be expected, an increase of the mischief they were intended to prevent. Every part of the ship was converted into a hot-house, and every part where the seeds of fungi had been deposited began to throw out a luxuriant crop of mushrooms; and where these did not appear, the juices of the wood were thrown into a state of fermentation, and, in the course of a twelvemonth, a great part of her upperworks became a mass of rottenness. After staving the powder magazines of some of the ships, there appeared under their floors, which are contiguous to much moisture, numbers of large excrescences of a leathery consistence, of the size and shape of a quart glass-decanter; and in all such parts where two surfaces of the wood were imperfectly brought into contact, were whole masses of fungi.

Winter-felled timber.

Another mode, of very ancient standing, was practised for getting rid of the juices of timber. This was supposed to be effected by felling the tree in the winter season, when the sap had descended and the vessels were empty. But by this practice the bark of the oak, so valuable in the process of tanning, was lost, as it will strip only from the wood in the spring of the year, when the sap is said to be rising. The supposed superior quality of the wood when winter-felled, and the general practice of felling oak timber at that season, may be inferred from a statute of James I. by which it is enacted, that no person or persons shall fell, or cause to be felled, any oaken trees meet to be barked, when bark is worth 2s. a cart-load (timber for the needful building and reparation of houses, ships, or mills, only excepted), but between the first day of April and last day of June, not even for the king's use, out of barking time, except for building or repairing his majesty's houses or ships.

The old Sovereign of the Seas is the standing example generally quoted to prove the beneficial effects of winter-felled timber. We are informed by one writer that, when taken in pieces, after forty-seven years' service, the old timber was still so hard that it was no easy matter to drive a nail into it, and all future writers have taken it for granted that this was owing to its being winter-felled. Mr Pett, however, who built her, takes no notice of any such circumstance. He merely says he was commanded by the king, on the 14th May 1635, to hasten into the north to procure the frame-timbers, plank, and trenails, for the great new ship at Woolwich. But he left his son behind to ship the moulds, provisions, and workmen, in a hired ship, to transport them to Newcastle; that the frame, as it was got ready, was sent in colliers from Newcastle and Sunderland; and that, on the 21st December, *in the same year*, the keel was laid in the dock; and in less than two years after this she was launched. Now, as it was the middle of May before Mr Pett received his majesty's commands to procure timber for this ship, and as she was on the stocks the same year, it is not very probable that the timber procured and sent in colliers from Newcastle to Woolwich was felled in the winter; much less could it have been "stripped of its bark in the spring, and felled the *second* succeeding autumn," as Mr Wade has it.

Neither is there the least proof of the old Royal William, recently broken up, when a century old, being built of winter-felled timber. The fact is, that she was rebuilt half a dozen times, and the only old and original timber remaining in her was in the lowest part of her hull, always immersed in the salt water externally, and washed with the bilge-water internally; and the wood from this part of her, when broken up, was perfectly sound, but quite black, having the appearance of being charred.

As far as experiments have been made, there is no reason to conclude that timber felled in the winter is at all more durable than that which is felled at the usual time. In the year 1793, the Hawke sloop of war was ordered to be built, one side being of timber that had been barked in the spring and felled in the winter, and the other side with timber felled at the usual time. In 1803 she was reported to be in so bad a state of rottenness, that she was ordered to be taken in pieces, when no difference whatever could be discovered in the state of the timbers of the two sides. It is said, however, in Derrak's *Memoirs of the Navy*, "that the timber had been stripped in the spring of 1787, and not felled until the autumn 1790," and this is given as an explanation of the failure. Why the barking in the spring should add to the durability of timber, is not easily conceived, if the object be to fell the timber when all the sap-vessels are empty, as, if the sap *descends* at all, which is doubtful, it might be expected to descend more freely when the bark is on than off the tree. This subject has not escaped the attention of the commissioners of the royal woods and forests, and various experiments have been made with a view to throw more light on a subject so vitally important to the British navy. In France, so long ago as 1669, a royal ordonnance limited the felling of timber from the 1st October to the 15th April; and the conservators of the forests directed that the trees should be felled when the "wind was at north," and "in the wane of the moon;" and we find an instruction of Bonaparte, that "as ships built of timber felled at the moment of vegetation must be liable to rapid decay, and require immediate repairs, from the effect of the *fermentation of the sap* in those pieces which had not been felled at the proper season;" the agents of the forests should abridge the time for felling naval timber, which should take place "in

Dry Rot.

the decrease of the moon, from the 1st November to the 15th March."

Immersion in earth, sand, or water.

The facts are so numerous and so strong in favour of the durability of timber when steeped in water or buried in earth or sand that no doubt whatever can be entertained of the efficacy of such a practice. At Brest all the timber used in ship-building is deposited in the narrow creek of the harbour which runs through the middle of the dock-yard, and it is said that the Brest built ships never had the dry rot. The same practice prevailed at Cadiz and Carthagena. Indeed there is reason to think that steeping in fresh water is a preventive of dry rot, probably by dissolving the juices of the timber. It was an ancient practice, and we believe is still followed in some parts of England, to place the timber intended for thrashing-floors in the midst of a stream of water, to *harden* it; and all the oak plants intended for the wainscotting of the old mansions were previously steeped in running water.

"I know it," says Mr Chapman, "to be the opinion of some well-informed men, whose sentiments are highly deserving of notice, that the sap of trees does not descend, but, like the arterial blood, is prevented by valves from returning; as a proof of which, it is asserted, that fresh-cut timber, if laid in a running stream, with the but-end towards the current, will have the water percolating through it, and carrying off the mucilaginous matter, but not otherwise." "There can be no doubt," he adds, "that the effect will be produced sooner in this direction than the other, and it should therefore be attended to." The reason is obvious; the extractive matter, which is the chief, though not the only, cause of putrefaction, is dissolved and driven off. The usual mode of preserving timber for masts, is to keep it immersed in water in what are called mast-locks. The mast of the Kangaroo sloop of war was dug out of the mud at the bottom of the mast-pond, at Deptford dock-yard, where it had been fifty years, and was one of the most serviceable masts in the navy. Burying timber in sand is a usual process for preserving it in warm climates. Yet, with all these facts and long experience, it was but very recently that the steeping of timber in salt water was practised in the king's dock-yards, and this originated in an accident. The Resistance frigate went down in Malta harbour. But as she had been reported in such a state of dry rot, or rather the surface of her timbers so covered with fungus, as to render it expedient to send her home, she was suffered to continue under water for many months. On her arrival in England it was observed that all appearance of fungus had vanished, and she remains a sound ship to this day. Yet even this fact does not seem to have attracted much attention. But when the dock-yard was removed from the northern to the southern side of Milford-haven, a few loads of timber that was covered with fungus were suffered to remain in the water for several months; and it was observed that, after being taken out and stacked in the new yard, the timber did not exhibit those appearances of dry rot which the same timber did most abundantly which had not been immersed in the salt water. This fact being reported to the navy board, it was proposed to sink one of two sister ships, the Mersey and the Eden, both alike infected with the dry rot, in Plymouth Sound. The Eden was the ship selected for this purpose. She remained under water for about eighteen months, and, on being raised, every trace of fungus had totally disappeared, whilst the Mersey was almost wholly covered with it. After remaining a year at home perfectly sound, she was sent out to the East Indies.

It is said, and there seems to be no reason for doubting the fact, that the planks of ships near the bows, which are obliged to be boiled in water or steam in order to bend them, are never infected with the dry rot: if the water in which they are boiled be strongly impregnated with salt, the effects would probably be more durable and decisive.

Dry Rot.

In a lecture read by Mr Ogg, a salt refiner, to the Plymouth Institution, on the prevention and cure of dry rot in ships of war, common salt is strongly recommended, for its cheapness, its wholesomeness, and its easy application; but he proposes a saturated solution of salt, in which he would steep not only single logs or planks, but the whole frame of a ship, or even the ship itself. "Let every ship in the navy," says the salt refiner, "be immersed a sufficient time in this fluid, and let every new ship be prepared in the same way, and dry rot would be heard of no more. But how is this to be accomplished? I answer, provide a dock or docks sufficiently capacious to receive five, ten, or twenty ships, and the work is done." As common sea-water will answer the purpose equally well, the apparatus of extensive docks and water saturated with salt are wholly unnecessary. But Mr Ogg, like Mr Bowden, appears to mistake the real cause of dry rot. "I affirm," says he, "that dry rot is occasioned by the vegetative principle; brine will destroy this principle; then sink the ship in brine." The experiments in the case of the Resistance and the Eden show that brine is not necessary.

The Dutch having observed that their busses, in which the herrings were caught and stowed away in pickle, lasted longer than any other craft, adopted the practice of filling up the vacancies between the timbers and planks of ships with salt, and of boring holes in the large timbers and cramming them full of salt. The Americans also found, that the ships employed in carrying out salt for their fisheries and domestic purposes were the most durable; and both they and the Dutch are glad to get a cargo of salt into a new ship, as the surest means of preserving her. The carpenter of the Franklin, an American seventy-four gun ship, when at Spithead, told some of her visitors, that at the junction of the beams, and at the butends of the timbers, pieces were cut, and the hollow part filled with salt, and covered over with felt, for the purpose of preserving those parts where two surfaces are imperfectly brought together, from the dry rot, where it is always most prevalent.

There are, however, very serious objections to the immersion of ships in a strong solution of salt, and the practice of inserting salt in the vacant space between the timbers, which may not, perhaps, apply with equal force to their immersion in sea-water. It is observed by a writer in the *Quarterly Review* for October 1814, that "the attraction for moisture which salts and acids possess, would keep the whole interior of the ship dripping wet; which would not only destroy the ship with the wet rot, but the ship's company also, whose health, experience has proved, is best preserved by keeping the ship as dry as possible; and thus the remedy would be worse than the disease." These bad effects have unquestionably been experienced, the muriate of magnesia, which exists in sea-water, being one of the most deliquescent salts; but whether the abstraction of moisture from the atmosphere be of long duration, is a fact which remains to be proved. In corroboration of the injurious effects above described, Mr Strange, in his *Evidences*, observes, "that the practice at Venice of the fresh cut timber being thrown into salt water prevents its ever becoming dry in the ships, and that the salt water rusted and corroded the iron bolts." Mr Chapman also observes that "the *Florida*, a twenty gun ship, taken from the Americans, and subsequently commissioned in the British service, had been salt-seasoned; and the result was, that in damp weather every thing be-

came moist, the iron work was rusted, and the health of the crew was impaired; in fine," he adds, "vessels so circumstanced are perfect hygrometers; being as sensible to changes of the moisture in the atmosphere as lumps of rock salt, or slips of fuci, or the plaster of inside walls where sea-sand has been used."

Mr Chapman, however, is of opinion, that vessels impregnated with bay-salt, or the large grained salt of Limington or of Liverpool (being pure muriate of soda, without admixture with the bitter deliquescent salts), will possess decided advantages, as would also vessels laden with saltpetre, if it has been dispersed among their timbers; and Mr Ogg sees no difficulty in refining salts so as to deprive it of its deliquescent quality. But if a very weak solution of salt, or even fresh water, shall be found to answer the purpose, the objection against immersing timber in sea-water seems to be got rid of. That it will immediately destroy all vegetable life in the delicate fibres of the fungus, and also prevent its future growth, is quite clear; and if it shall be found to prevent also the putrefactive process, it may be considered as the most advisable way to prepare timber for all purposes of house carpentry and ship-building.

Impregnation of timber with foreign substances.

A great variety of substances besides common salt, indeed almost any salt or acid, will destroy and prevent the growth of fungus. Sir Humphry Davy recommends a weak solution of the corrosive sublimate as the most efficient. A solution of sulphate of iron or copperas is much used in Sweden for hardening and preserving wood for wheel-carriages, &c. It is first boiled in this solution for three or four hours, and then kept in a warm place to dry, by which process it is said to become so hard and compact that moisture cannot penetrate it. "The wooden vessels," says Mr Chapman, "in which the sulpho-ferruginous solution is finally placed for the copperas to crystallize, become exceedingly hard, and not subject to decay." A solution of alum has been recommended; but Mr Chapman seems to think that its earthy basis would become a nidus of putrefaction. The wood, however, which is used about alum works, becomes hard and durable, and resists fire in an extraordinary manner. All timber, in fact, when completely saturated with saline matter, is more or less indestructible, and absolutely incombustible. A solution of arsenic has not been found to prevent the dry rot. With regard to the impregnation of oils there are various opinions, some thinking them beneficial and others injurious to the durability of timber. It is known, however, that ships in the Greenland trade have their timbers and planks preserved as high up as they are impregnated with whale oil from the blubber; and Mr Chapman says, that one of the masters of a Greenland ship having payed her upperworks with twelve or more successive coats with whale oil in hot weather, they became covered with a thin varnish, much harder and more compact than if filled with successive coats of turpentine. Resinous substances, however, are probably better than oil.

After a variety of experiments and sensible observations, Mr Chapman sums up the three great operations by which timber may be brought to resist the tendency to dry rot.

1. To deprive the timber of its mucilage, which is very liable to fermentation.

2. To impregnate timber with any strongly antiseptic and non-deliquescent matter.

3. To dry timber progressively by the sun and wind, or by the latter alone; and then to close its pores completely with any substance impervious to air and moisture, and at the same time highly repellant to putrescency.

Mr Wade recommends the impregnation of timber with sulphates of copper, zinc, or iron, rejecting deliquescent salts, as they corrode metals, and would destroy the bolts and metal fastenings of a ship. He observes, that timber impregnated with saline matter is no longer capable of fermentation, and that, of course, the gases necessary for the nutriment of fungi are not evolved. Selenite is recommended as being insoluble, or nearly so, and not liable to any alteration in the ordinary temperature of the atmosphere; but all salts, he observes, composed of barytes, should be rejected, because, though they are plentiful, cheap, and have some qualities eminently fitting them to be employed for this purpose, yet they are, without any exception, very poisonous.

From all experiments that have been made, it appears that the most effectual method of preventing the dry rot, and of giving durability to timber, is that of depriving the sap of its mucilage, more especially in the alburnum, where it most abounds; for though seasoning in the dry way will coagulate and harden the extractive matter of timber, yet when exposed to heat, moisture. and a stagnant air, the process of putrefaction will commence, and all the symptoms of dry rot will speedily make their appearance. It will be preferable, therefore, that such timber as is likely to be exposed to the vicissitudes of weather, should be seasoned by immersion or impregnation, rather than by the dry way.

Cure of the dry rot.

In this disease, as in those incident to animal life, prevention is much easier than cure. In fact, there is no other cure for the part affected than excision, and the sooner it is done the better, as the disease spreads most rapidly when fungi are propagated, throwing their minute fibres into the tubes of the contiguous sound wood, and producing that moisture which is a condition absolutely necessary to the putrefactive process. If, however, the fibre of the wood is still sound, and the roots of the fungi extend not beyond the alburnum near to the surface, immersion in sea water, as in cases of the Resistance and the Eden, or impregnation with some of the solutions above mentioned, may stop the progress of the disease; but the only safe cure, we apprehend, is that of cutting out the infected part. The sinking of the Royal George at her moorings has not been the means of preserving her timbers. On being visited in the diving-bell, her oaken sides were broken down into a confused mass of timber and black mud; having, no doubt, been too far gone in decay when the fatal accident happened; but her fir deck appeared as sound as the day when she sunk.

Miscellaneous observations.

It is a great mistake to suppose that the ancients were unacquainted with the dry rot, or premature decay of timber. Pliny has a number of valuable observations on the preservation of timber, and on its decay occasioned by the juices; and, among other things, recommends that a tree should be cut to the heart all round, in order to let the juices escape, and that it should not be felled until the whole had run out. He knew that the sappy part of oak was more subject to rot, and advised that it should be cut away in squaring. He knew, too, that resinous and oleaginous matter in wood preserved it; observing, that the more odoriferous a piece of timber is, the more durable. He knew that much depended on the close texture of timber, and that box, ebony, cypress, and cedar, might almost be considered as indestructible. We also know that cedar teak, and mahogany, are very durable woods.

The felling of timber while young and full of vigour, making use of the sap-wood or alburnum, and applying it to ships and buildings in an unseasoned state, have no doubt contributed to make the disease of dry rot infinitely more common and extensive than it was in former times, when our ships were "hearts of oak," and when in our large mansions the wind was suffered to blow freely through them, and a current of air to circulate through the wide space left between the pannelled wainscot and the wall.

In those old mansions which yet remain, and in the ancient cathedrals and churches, we find nothing like the dry-rot, though perhaps

> ———————— perforated sore
> And drill'd in holes, the solid oak is found
> By worms voracious eaten through and through.

Numerous examples of the extraordinary duration of timber may be produced, both from complete desiccation and exposure to the air, and from the complete exclusion of air and immersion in earth or water. Without adducing the surturbrandt of Iceland, covered with several strata of solid rock, or the logs of wood dug out of peat-moss, the antiquity of which is mere conjecture, we may instance the mummy cases of Egypt as being in all probability the most ancient timber in existence that has been worked by the hand of man. When Belzoni entered the splendid tomb of the kings of Thebes, in which was the transparent sarcophagus of gypsum, he found two human figures larger than life sculptured in wood, in as good preservation as if it had been worked in his own time; but the sockets of the eye, which had been copper, were entirely wasted away. We are told by Pliny, that the image of Diana at Ephesus, supposed to be of ebony, remained entire and unchanged, though the temple itself was ruined and rebuilt seven times. He adds that, in his own time, the image of Jupiter in the capitol, made of cypress wood, was still fresh and beautiful, though set up in the year after the foundation of Rome 551, nearly three hundred years before. He further says that there was a temple of Apollo at Utica, the timbers of which, being of Numidian cedar, are said to have stood 1188 years. The roof of Westminster Hall, which is constructed of oak, has stood for more than three hundred years, and is probably better now than when newly erected. Similar instances of the long duration of timber have occurred in situations where the atmospheric air has been excluded. In the Leverian Museum was a post said to be dug out of Fleet Ditch, charred at the lower end, having the name of Julius Cæsar cut into it. The foundation on which the stone piers of London Bridge are laid consist of huge piles of timber driven close to one another, on the top of which is a floor of planks ten inches thick, strongly bolted together; on these the stone piers rest, at above nine feet above the bed of the river, and, at low water, may be seen or felt at a very few inches below the surface. These piles have been driven upwards of six hundred years, and, from the solidity of the superincumbent weight, it may be concluded that they are perfectly sound. In the old city wall of London, timber is frequently dug out as sound and perfect as when first deposited there. As the last instance of the extraordinary preservation of timber, we may mention that in digging away the foundation of the Old Savoy Palace, which was built about six hundred and fifty years ago, the whole of the piles, consisting of oak, elm, beech, and chestnut, were found in a state of perfect soundness, without the least appearance of rottenness in any part of them, and the plank which covered the pile-heads was equally sound. Some of the beech, however, after being exposed a few weeks to the air, but under cover, had a coating of fungus spread over the surface; which affords a striking proof of the immense length of time that the seeds of this parasite will remain dormant, without parting with the principle of vegetable life, which is called into activity from the moment that they are deposited in a situation favourable to their growth. In this instance we have only to suppose that the indurated juices of the wood became dissolved by its exposure to the moist atmosphere, and the phenomenon of fungous vegetation is capable of receiving a satisfactory explanation.[1]

(J. B—W.)

DRYSALTER properly signifies one who deals in dried or salted meats, pickles, sauces, &c.; but it is also used for a dealer in dye-stuffs, paints, chemical products, &c.

DUAL (*dualis*, from *duo*, *two*), in *Grammar*, a form of the verb and noun in the ancient Greek, Sanscrit, and Gothic, and the modern Lithuanian languages, in which two persons or things are indicated, in contradistinction to *plural*, which expresses an indefinite number.

DUALISM, the name given to that philosophical scheme which endeavours to explain the phenomena of existence by the hypothesis of two principles equally necessary, equally eternal, and therefore independent of each other. Cosmological or metaphysical dualism has reference to the distinct existence of God and nature; theological or mythological dualism to that of good and evil; and psychological dualism to that of soul and body.

DUBLIN,

County.

A MARITIME county containing the metropolis of Ireland, in the province of Leinster, bounded N. by the county of Meath, E. by the Irish sea, S. by the county of Wicklow, W. by the counties of Kildare and Meath. Excepting Louth and Carlow, it is the smallest county in Ireland,—comprising, according to the ordnance survey, an area of 354 square miles, or 229,709 acres, of which 196,063 are arable, 19,312 uncultivated, 5519 in plantations, 170 under water, and, exclusive of the city of Dublin, 1820 in towns.

Ptolemy, the geographer, marks the district as being inhabited by the tribe of the Eblani; and owing to its situation, it was at an early period much exposed to the incursions of the Danes and Northmen, who, having taken possession of the Isle of Man, after their defeat at Stainford Bridge in England, subsequently established themselves in this neighbourhood. At the period of the English invasion, the city of Dublin and the adjoining districts were in the possession of those active and warlike seamen, from whom the tract of country north of the city was named Fingal, or the country of the White Strangers, a name given by the natives to the invaders on account of their fair hair and complexion. The inhabitants of this locality are chiefly of Danish or Anglo-Norman origin, and are described by the Rev. Cæsar Otway, as "still a taller and fairer race than is seen in almost any other part of Ireland; and as you enter Lusk, Skerries, or Rush, you observe the men more athletic,

---

[1] The process termed *kyanizing* is similar to that already noticed, as proposed by Sir Humphry Davy,—namely, steeping the timber in a solution of corrosive sublimate. This appears to be one of the best preservatives of wood in so far as dry-rot is produced by a fungus.

Mr Bethell's method of preparing wood for fences, railway-sleepers, piles and other wood-work submerged in water, and for various similar purposes, is said to render timber of any description much tougher, and greatly to promote its durability. The process is as follows: The timber is placed in a strong close iron tank, which is filled with oil of tar and other bituminous matters containing creasote, and with pyrolignite of iron; the air is then exhausted by powerful air-pumps; after which more of the saturating fluid is forced in by hydrostatic pumps. When the wood has been subjected for six or seven hours to a pressure of from 100 to 150 pounds on the square inch, the process is complete, and the wood is found to weigh from 8 to 12 pounds per cubic foot heavier than before. It also preserves iron bolts driven into it from corrosion. Wood thus prepared has been used for sleepers on several of the great English railways, and is said to have proved extremely durable. (See Ure's *Dict. of Arts*, &c., vol. ii, p. 963.)

the women better favoured, than the natives of the adjoining districts." Their descent from the Northmen is further exhibited by the character they have maintained, as being the hardiest and best sailors on the eastern coast of Ireland. The district S. of the city was denominated Harold's country, a name which it long retained. After the arrival of the Anglo-Norman invaders, grants of land, confirmed by Henry II., were made by Strongbow to his followers, who introduced the feudal system into Ireland without those checks, which would have rendered it in those early times beneficial, or at least tolerable, and without having acquired that influence over the native population which was necessary to cement the power of the owners of the soil, and admit of some identity of interest. These extensive grants laid the foundations of the wealth of the chief families and religious houses in the county; and the possession of "these large scopes of land and great liberties, with the absolute power to make war and peace, did raise the English lords to that height of pride and ambition, as that they could not endure one another."

In 1210, King John formed this district and some of the adjoining neighbourhood into a county, comprising the chief portion of country within the English pale. The limits of the county were very uncertain, and have undergone many changes before they were fixed within the present boundaries. Although so near the seat of government, 67,142 acres of profitable land were forfeited in the Rebellion of 1641, and 34,536 acres in the Revolution of 1688.

The county of Dublin is now divided into nine baronies. Balrothery East and West, in the northern part of the county, are of level surface and productive soil, resting almost wholly upon a limestone foundation, and are principally used in tillage; within their limits are the village of Lusk, with its ancient round tower, the maritime village of Rush, enumerated by Holinshed among the chief haven towns of Ireland, but now decayed; the considerable fishing village and harbour of Skerries and Balbriggan, previous to 1700 a small fishing village, but raised by the late Baron Hamilton and his descendants to the position of a town of some importance with a harbour, which is the only place of shelter for vessels exposed to severe weather, between the bays of Dublin and Carlingford. Coolock barony, to the north of the city of Dublin, also rests upon limestone, excepting the remarkable promontory of Howth, which, like Bray Head in the adjoining county of Wicklow, is formed of quartz rock; within this barony are the sea-bathing villages of Clontarf, Howth, and Malahide, the islands of Lambay and Ireland's Eye, and the suburban villages of Artane, Coolock, Raheny, and Santry, &c. Nethercross, another northern barony, with a level surface resting entirely upon limestone, contains the ancient parliamentary borough of Swords, once a corporate town, and the most ancient place in the county, with a round tower, and the ruins of an archiepiscopal palace, the once classic village of Glasnevin, the residence of Dr Delany and Tickell the poet, and occasionally of Swift, Addison, Sheridan, Parnell, &c. It is now decayed, and chiefly known as giving name to the neighbouring Roman Catholic cemetery, and the Botanic Gardens of the Royal Dublin Society. Newcastle barony is an undulating limestone district lying west of the city, watered by the Liffey and Dodder; comprising the western suburbs of the city of Dublin, the pleasantly situated and once frequented village of Lucan, and the small village of Newcastle, which formerly had a portrieve and burgesses under a charter of James I., and previous to the Union sent two members to the Irish parliament. Uppercross is a barony situated S. and S.W. of the city, extending from Dublin to the N.W. borders of the county of Wicklow, and containing Clondalkin, with its well-preserved and elegant round tower, and a large portion of the most frequented suburbs of the city. The half barony of Rathdown is bounded by the sea, and comprises the most picturesque and ornamented portion of the county S. of the city, including Dundrum, Blackrock, Kingstown, Dalkey, and Killiney. Castleknock barony, which includes the Phœnix Park, rests on a limestone foundation, and extends to the county of Meath. The barony of Dublin, erected by the act 5th and 6th Vict., cap. 96, consists entirely of the rural portions of the former county of the city of Dublin, comprising Ball's Bridge, with the botanic garden of the university, a portion of the parish of Monkstown, Sandymount, and the village of Donnybrook, remarkable only for its fair, originally granted by King John to be held for fifteen days, but now limited to one week in duration; and although still much frequented, gradually falling into decay as a pleasure fair.

These nine baronies, together with the city of Dublin, are subdivided into 83 parishes, comprised within the archdiocese of Dublin. The amount of property valued in the county, under the act 6th and 7th Vict., cap. 84 (Griffith's Valuation) is L.533,616, and the net annual value of property rated to the poor in the county is L.502,873. The only union workhouses, besides those in the city of Dublin, are those of Rathdown and Balrothery; but portions of the county are within the neighbouring unions of Celbridge, Naas, and Dunshaughlin. The county is the headquarters of the military district of Dublin, as well as of the commander-in-chief and staff of Ireland. The headquarters of the county militia are stationed at Lucan. The constabulary force, consisting of about 250 men and officers, has its headquarters at Ballybough, and district stations at Clontarf, Lucan, Swords, Rathfarnham, and Balbriggan. Excepting the metropolis, with its populous suburbs, and Kingstown, there are no places of magnitude within the county, the largest being the maritime town of Balbriggan, with 2310 inhabitants.

Previous to the union with Great Britain, this county returned ten representatives to the Irish parliament; two for the county, two for the city, two for the university, and two for each of the insignificant boroughs of Swords and Newcastle. The number of representatives was reduced to five by the act of Union, one member being withdrawn from the university, and the boroughs of Swords and Newcastle disfranchised. The Reform act restored the second member to the university, leaving the representation in other respects unchanged. The constituency of the county in 1852, under the act 13th and 14th Vict., cap. 69, was 6657, being a much larger number than during the existence of the forty-shilling freeholders before the Reform act.

The northern coast of the county from Drogheda to Howth has generally a sandy shore, and affords only the harbour of Balbriggan, which has been much improved of late years, and the small fishing harbour of Skerries. In the promontory of Howth, the coast suddenly assumes a bolder aspect; and between the town of Howth and the picturesque rocky islet of Ireland's Eye, is the artifical harbour constructed in an injudicious locality, at an expense of above one-third of a million sterling, but now almost choked up with sand, and useful only to vessels of small burthen, fishing vessels, and to a few boats belonging to the place. Dublin Bay, which extends from the peninsula of Howth to Dalkey Island, is five miles in width at its entrance, and although eminently beautiful among the marine inlets of the United Kingdom, the attempt to place it in competition as regards scenic grandeur with the Bay of Naples, to which it bears little resemblance, and by comparison with which it suffers at every point, is very injudicious. On the southern shore of the bay is the harbour of Kingstown, one of the most splendid artificial ports in the United Kingdom, commenced in 1816, from designs by the late Mr Rennie, at an estimated cost of L.801,159, nearly the entire of which amount has been expended in its construction. The eastern pier is 3500 feet in length, and the western pier extends

4950 feet from the shore, leaving an opening of 850 feet at the mouth of the harbour, the whole comprising an area of 250 acres, and varying in depth from 15 to 27 feet. Owing, however, to the width and erroneous position of its entrance, the anchorage within is so much exposed, that it has somewhat disappointed expectation, and requires an exterior breakwater to render it a secure anchorage at all times.

At the southern extremity of Dublin Bay is Dalkey Island, the channel between which and the mainland occasionally affords a good roadstead for shipping, and was considered by some engineers as the most appropriate situation on which the public money could have been expended on a harbour of refuge. The beautiful bay of Killiney, which is much exposed, extends from near Dalkey to the southern extremity of the county.

The largest island off the coast is the hilly cultivated island of Lambay, the property of Lord Talbot de Malahide, to the north of Howth, comprehending about 600 acres. Shell-fish, especially lobsters and crabs, are taken in abundance on the shore. In the reign of Queen Elizabeth it was granted to Archbishop Usher, and was his favourite residence during the composition of a considerable portion of his writings. To the north of Lambay are the Skerries, consisting of the islets of Innispatrick, Colt, Shenex, and Red Island, the latter of which is connected with the mainland by the pier of Skerries. Innispatrick is noted in the ecclesiastical annals of the country as being the place on which it is supposed St Patrick first landed in Ireland, and where he built a church. Between Lambay and Howth is the picturesque islet called Ireland's Eye, a craggy rock, comprehending about 54 acres, and supposed by geologists to be an insulated portion of the neighbouring peninsula. At the southern extremity of Dublin Bay is Dalkey Island with an area of 22 acres, affording good pasturage.

The only stream deserving the name of river is the Liffey, which, rising in the table-land of Wicklow, and precipitating itself over a ledge of rocks, forms the fine cataract of Polaphuca, near which it is joined by the mountain rivulet called the King's River, and traverses the level county of Kildare; on leaving which it intersects the county Dublin, and after falling over another elevated ledge of rocks, called the Salmon-leap, at Leixlip, the Liffey resumes its tranquil character, and, passing through the centre of the city, discharges its waters into the Bay of Dublin. It is joined at its mouth by the Dodder, a mountain stream which, though too insignificant to afford depth sufficient for the smallest boat, supplies water for several mills of various description during its short course from Kippure Hill to its junction with the Liffey. The other streams which are numerous and very small, have all an eastern course.

The county is intersected in various parts by the Grand Royal canals running injudiciously parallel to each other; the Dublin and Drogheda, Midland, Great Western, Great Southern and Western, Dublin and Kingstown, and Dublin and Wicklow railways, affording great facilities for communication between different portions of the county, and with the interior and more distant ports of Ireland.

The population of the county, apart from that of the city of Dublin, and which had not previously been ascertained with any approach to accuracy, was returned in 1812 as amounting to 132,000; and subsequent parliamentary returns with greater accuracy have stated it as follows:—In 1821, 150,011; in 1831, 176,012; in 1841, 140,047, and in 1851, 146,731.

If these returns relate to the same area, it would appear that Dublin is the only county in Ireland the population of which decreased between 1831 and 1841, or increased in the subsequent decennial period.

The total number of children receiving education in 1824–26 was reported in a parliamentary return to be 33,008, of which number 20,440 were Roman Catholics, 10,372 belonged to the Established Church, 465 were Dissenters, and the persuasion of the remaining 1731 was not ascertained. In 1853, there were 159 national schools in operation, attended by 28,799 children, 13,321 males and 15,478 females.

The manners, appearance, and dress of the lower classes differ less from what may be considered as being peculiarly characteristic of the rural population of remoter districts, than might be expected in the vicinity of a large metropolis. Even in the immediate neighbourhood of the city are to be seen groups of cabins, exhibiting, both in their external appearance and in the dress and manners of their inmates, much to remind the observer of the peasantry of the interior.

The greater part of this county, which presents various features of peculiar interest to the geologist, rests on the eastern extremity of the great bed of floetz limestone that extends over the middle of the island, widening as it spreads westward. It rises in its southern part into a range of mountains, which forms the verge of an elevated district, extending thence for more than thirty miles to the south through the county of Wicklow. Through this tract a large body of granite passes in a south-western direction, commencing at Blackrock and passing by Dundrum and Rathfarnham, and forming the loftiest summit in this county; bounded on its eastern and western sides by incumbent rocks of great variety of structure and relations; the micaceous schist at Killiney and Rathfarnham; argillaceous schist, on both sides of the granite and quartz rock, in the eastern side alone, forming the promontory of Bray Head, and reappearing in the more northern part of the county, where it forms the picturesque peninsula of Howth, and rises to the height of 567 feet above the level of the sea. Within the portion of this district included in the county of Dublin, and distinguished by its beautiful scenery, are veins of lead ore at Dalkey and near the Scalp. The country near Bray presents, within a small space, an instructive series of rocks; and at Killiney schistose beds are to be seen, of considerable extent, reposing on granite. Near Booterstown, in Dublin Bay, a mass of compact limestone is visible, within a few fathoms of the granite. The calp of Kirwan, a variety of limestone, is the prevailing rock in the immediate vicinity of Dublin, and is much used for building; and the granite of Dalkey and the neighbourhood is also much used for architectural purposes in the city and environs; quantities of it are even exported to England. Petrifactions abound in many parts of the limestone country. In the peninsula of Howth gray ore of manganese, with brown ironstone, and brown iron-ore, have been obtained in abundance.

The northern portion of the county is flat, and the soil good, particularly in the parts bordering on Meath; but on the southern side, the land rises into elevations of considerable height, which extend into the adjoining county of Wicklow. The highest of these, Kippure Head, on the border of Wicklow, is 2473 feet above the level of the sea, and the Three Rock Mountain 1763 feet. The soil in these mountains is poor, affording no encouragement for tillage, chiefly covered with heath, except where a subsidence in the ground affords a nucleus for the formation of bog, with which about two thousand acres are covered. There are also a few small tracts of bog in the northern part of the county. The mountain district is well adapted for timber, to the growth of which much attention has lately been paid, and the labours of the improvers are already rewarded by some fine plantations equally ornamental and profitable. This range of mountain ground produces a very striking effect on the traveller proceeding to the metropolis from Wicklow county. On arriving at its brow, the whole of the plain watered by the Liffey spreads itself out before him, studded with villas, enriched with groups of trees, in the midst of which may be seen the few elevated buildings, spires, and domes of the city rising through the dusky canopy of smoke that envelopes them; whilst beyond, the beautiful

County.

expanse of Dublin Bay, backed by the Hill of Howth, the island of Lambay, and Ireland's Eye, and, in clear weather, still more remote, the Mourne Mountains in the county of Down, towering above them all on the horizon's verge, present a view of highly cultivated nature seldom surpassed.

Though by much the greater part of the soil is inclined to clay, it is not of the deep and tenacious character so common in England; scarcely any part being without a mixture of gravel. Due search will generally discover limestone or other beneficial substrata at no great depth, and the operation of draining generally raises a sufficiency of gravel to manure the whole surface. The position of the ground, usually more or less undulating, affords peculiar facilities for drainage; and the circumstance of a great city being placed in a central position in the county, furnishes large quantities of ashes and other manure well calculated to conquer the natural stubbornness of such soils. Along the coast between Howth and Balbriggan are salt marshes, of small extent.

The farms are in general small. Near Dublin, particularly on the southern side of the city, a very considerable portion of the county is appropriated to the ornamental grounds of the gentry, and used more for convenience and enjoyment than with a view to agricultural profit. The rents are proportionately high, being calculated more with reference to these circumstances than the quality of the land. Although in comparison with other counties in Ireland tillage is not in a backward state, there is in some parts of the county more appearance of neglect than might have been expected so near the metropolis.

The number of holdings in 1853 amounted to 6741, viz.,

Not exceeding 1 Acre.	Between 1 and 5 Acres.	Between 5 and 15 Acres.	Between 15 and 20 Acres.	Between 30 and 50 Acres.	Between 50 and 100 Acres.	Between 100 and 200 Acres.	Between 200 and 500 Acres.	Above 500 Acres.
2275	2084	1870	1028	623	622	376	125	13

The extent of land under crops in 1853 was 101·999 acres, divided as follows:—

Corn, Beans, and Peas.	Potatoes.	Turnips, Parsnips, Mangold-Wurzel, &c.	Cabbage and other Green Crops.	Flax.	Meadow Clover, & Rape.
41,309	7465	6009	3327	2	43,887

The produce of the crops in the county of Dublin is in every instance above the average production of all Ireland, and generally greater than in any other county; not so much on account of any natural superiority in the soil, as by reason of the facilities afforded by the neighbourhood of a large city, and the consequent greater expenditure of capital on the land. The result of an inquiry recently undertaken into the state of farm cultivation, and the condition of road-sides, &c., as to the growth of weeds, places the county of Dublin at the head of the list, and therefore exhibits it as the most highly cultivated county in Ireland.

The live stock of the county in 1853 consisted of 19,448 horses, 3167 mules and asses, 44,063 cattle, 43,007 sheep, 19,041 pigs, 5229 goats, and 158,135 head of poultry. And the total value of stock was, in 1849, L.484,078; in 1850, L.520,720; in 1851, L.503,904; in 1852, L.518,857; and in 1853, L.525,586, being an increase in value of L.6729 over the previous year.

The fishery districts are Dublin and Malahide, together comprising 85 miles of maritime boundaries, with about 500 registered fishing vessels, employing 3000 men and boys. The chief stations are Howth and Skerries, the former of which is much used by the Manx and Cornish fishermen, who resort in considerable numbers to the harbour of Howth during the fishing season. Dublin Bay haddock and herrings have long been esteemed, and justly so, for their superior quality and flavour.

The manufactures of the county are mainly confined to the city of Dublin and its immediate neighbourhood. There is also at Balbriggan a manufactory of cotton hosiery in much repute.

Without leaving the county of Dublin, the antiquary would have no difficulty in finding numerous objects of interest and instruction, casting light upon the early history of the country. Among the ancient raths, duns, or forts constructed by the native Irish or the Danes, and more probably by both people, for defence or security in positions of natural strength, improved by art and labour, several remain in this county. One at Ratheny, although much reduced in its proportions, is still traceable; several yet more imperfect are faintly visible at Coolock; one near Lucan is furnished with the subterranean vaults and passages not unusually found in connection with the larger specimens; and another at Shankhill or Rathmichael, near the remarkable natural pass through the mountain called the Scalp, is of greater extent than the others, more commanding in position, and in close proximity to the ancient church, and supposed fragment of a round tower. Numerous sepulchral mounds of the same period also exist scattered throughout the county, occasionally somewhat similar in appearance to the raths, but generally smaller in extent, altogether artificial and of conical form. Among its most interesting antiquities this county reckons three of the ancient round towers almost peculiar to Ireland; one at Swords; another at Lusk, forming one of the angles of the church steeple; and a third in the highest state of preservation at Clondalkin. "No one who sees but once their beautiful, lofty, and slender shafts shooting up into the sky, and dominating in solemn grandeur the surrounding landscape—all strikingly resembling one another, and resembling nothing else—but must be struck with admiration and curiosity of the liveliest kind; and yet these primary feelings are but slight in degree when compared with those which are excited by the consideration of all the extraordinary circumstances involved in their history. That these towers have existed, or, at least, the majority of them, for upwards of 1000 years, is certain; that they may have existed twice or thrice this period is far from improbable; but that the era of their origin, and the object of their erection remain as secrets yet to be unfolded, are circumstances which only add to the mysterious interest which attaches to them."—(*Memorandums made in Ireland by Sir John Forbes.*) They however are probably not older than the introduction of Christianity; and seem of the same origin as the detached round towers of Abernethy in Perthshire, and of Egilsey in Orkney.

The little church of St Douloughs is worthy of note for the extreme antiquity of its architecture. It is 48 feet in length by 18 in width, and is covered by a double stone roof; and Dr Ledwick ascribes its construction to the Danes in the eleventh century, while other antiquaries suppose it to be of earlier date. A fine cromlech of six upright stones, supporting one of 18 feet by 15, and estimated to weigh above 25 tons, is still preserved near Cabinteely. The remains of a stone chair, and a rudely sculptured piece of granite, mark the former existence of an ancient temple near Killiney. At Old Connaught is a cross of considerable antiquity formed of granite, its shaft surmounted by a circle, on which the Crucifixion is rudely sculptured; and close by the church of St Douloughs are the remains of one of the crosses which once marked the croceæ or lands of the cross, dedicated to and under the jurisdiction of the church. There are also the remains of many castles and fortified houses, and, as throughout the whole of Ireland, numerous ruins of the ancient parochial churches without architectural pretension, but picturesque in their decay. The adjoining ground is still used as a place of sepulture by the peasantry, the locality being otherwise entirely neglected; and even in the vicinity of the metropolis neither wall nor fence protects these burial-grounds from intrusion.—(Thom's *Irish Almanac;* D'Alton's *History of the County of Dublin;* Archer's *Survey of the County of Dublin.*)

City.

Dublin, the metropolis of Ireland, in the county to which it gives name, and province of Leinster, ranking in importance as the second city in the United Kingdom. It is distant 292 miles W.N.W. from London, 138 miles west from Liverpool, and 60 miles west from Holyhead, in Lat. 58. 20. 38. N., and Long. 6. 7. 13. W., agreeably situate in the great central limestone district which reaches across the island from the Irish Sea to the Atlantic Ocean, on the river Liffey, and extending to the junction of that river with the Bay of Dublin, the waters of which wash its suburban shores.

Like almost every city of importance in the Old World, it is of very ancient origin; but of its first establishment no records exist, neither do any very ancient structures remain

City.

which could assist the researches of the antiquary. In the absence of tangible proof, conjecture has been busy at work, ingeniously constructing baseless stories of ancient grandeur belonging to the regions of pure romance, without a particle of historical foundation. Dublin is supposed to have been mentioned by Ptolemy the geographer, in the second century of the Christian era, as one of the chief places in Ireland, under the name Eblana; from a corruption of which word, or from the Irish Duiblinn, *the black or dark water*, the present name of the city is conjectured to have derived its origin.

At the earliest period of which any records remain, Ireland was governed by numerous petty princes or chieftains constantly at strife with each other for the mastery, which none obtained. As a natural result of this state of affairs, the population must have been thinly scattered over the country, and the power of each prince of small extent. At the close of the fifth century and subsequently, the Danes, or Northmen, called in Ireland Ostmen, from their eastern origin as compared with that country, were enabled, with various success, to maintain themselves in the city and adjoining neighbourhood, occasionally making inroads into the interior, committing great ravages, more especially (as they were heathens) against the religious establishments. In the middle of the tenth century, the Danes had become converted to Christianity, but being always exposed to attack in retaliation of their former outrages, fortified the city of Dublin, and the oldest remains of building were of their construction. About the year 1014 the Danes were defeated by the united Irish forces under Brien Boroihme, at the memorable battle of Clontarf, and were driven into the promontory of Howth, of which they retained possession until defeated by Sir Amoric Tristram, ancestor of the Earls of Howth, and Sir John de Courcy in 1177. They also, in diminished force, reoccupied the city, which was in their possession in 1170, when Dermod MacMorrough and his English allies who had landed at Bannon in 1169 and reduced the Danish cities of Wexford and Waterford, marching their forces from the south of Ireland under the leadership of the Anglo-Normans Milo de Cogan, Raymond le Gros, and Strongbow Earl of Pembroke, besieged and took the city, or rather the government of the city, from them. The Hiberno-Danish king escaped, collected forces in the Orkneys, Hebrides, and Isle of Man, and in the following year made an attempt to recover possession of Dublin, but was taken prisoner and put to death by order of Milo de Cogan, the first Anglo-Norman governor of the city; and thus terminated the last of the persevering attempts made by the enterprising Northmen to establish themselves in a position of which they instinctively appreciated the commercial value. In succession to that rude, hardy, and maritime people came the more warlike yet polished Anglo-Normans. Soon after his landing in 1172 at Waterford, Henry II. arrived in Dublin, and held his court there in a pavilion of wicker-work made "after the country manner," where the Irish chiefs were entertained with great pomp, and alliances entered into with them; "the plenty of the English table and the goodly courtesy of the attendants" having done much to reconcile them to their new allies. Previous to his departure for England, Henry bestowed the government on Hugh de Lacy, having granted by charter "to his subjects of Bristol his city of Dublin to inhabit, and to hold of him and his heirs for ever, with all the liberties and free customs which his subjects of Bristol then enjoyed at Bristol and through all England." In 1177 Strongbow, Earl of Pembroke, and the chief leader of the Anglo-Norman forces, died in Dublin of a mortification in one of his feet, and was buried in Christ Church Cathedral, where his monument still remains well preserved, probably because the rents of many of the tenants were made payable on Strongbow's tomb. A fresh charter was granted in 1207 by King John to the inhabitants, who had not yet made their peace with the neighbourhood, but, like the settlers in other towns, were at constant feud with the native Irish; so that two years after the date of this charter, whilst the citizens of Dublin were celebrating Easter at Cullenswood, they were set upon by the Irish of the neighbouring mountains and 500 of them killed. The scene of slaughter was afterwards called the Bloody Fields, and Easter Monday denominated Black Monday. On each succeeding anniversary of that day, with the desire unfortunately so prevalent of perpetuating a feud, the citizens marched out to Cullenswood with banners displayed—"a terror to the native Irish." In 1216 Magna Charta, a copy of which is to be found in the red book of the exchequer, was granted to the Irish by Henry III. In 1217 the fee farm of the city was granted to the citizens at a rent of 200 marks per annum; and about this period many monastic buildings were founded.

In 1227 the same monarch confirmed the charter of John fixing the city's boundaries and the jurisdiction of its magistrates. During the invasion of Ireland by Edward Bruce, who had landed at Carrickfergus with 6000 men, in the commencement of the reign of Edward II., some of the suburbs were burnt to prevent them from falling into his hands. The inroad of Bruce had been countenanced by the native Irish ecclesiastics, whose sentiments were recorded in the statement addressed to Pope Innocent XXIII. by Donald O'Neill:—"That a nation governed for four thousand years by its own princes, should by Adrian have been made over to a horde of tyrants, far more cruel than the teeth of wild beasts, who had seized all the best of the soil, and driven the rightful owners to the bogs and to the mountains—that instead of reforming the people, and extending the boundary of the church, its property had been plundered, its religious houses wasted, the native clergy persecuted, and *Peter's pence* had not been paid—that the simplicity of the people had by bad treatment been changed into the craft of the serpent—that the object of those he had sent over was the extermination of the Irish race—that no Irishman for any grievance however great could institute an action in the king's court; that if an Englishman murdered an Irishman, be he bishop or layman, the civil court could take no cognisance of the act; and that having often and vainly petitioned the English king for redress, they had offered the crown to Edward Bruce." The energetic preparations for defence made by the citizens induced the Scots to abandon their intention of besieging the city.

Richard II. erected Dublin into a marquisate in favour of Robert de Vere, whom he also created Duke of Ireland. The same weak monarch, "as full of valour as of royal blood," entered Dublin in 1394 with 30,000 bowmen and 4000 cavalry, bringing with him the crown jewels; but after holding a parliament and making much courtly display before the native chieftains, on several of whom he conferred knighthood, the king returned to England. Five years later, enriched with the spoils of his uncle, "Old John of Gaunt, time honour'd Lancaster," Richard returned to Ireland, landing at Waterford, whence he marched through the counties of Kilkenny and Wicklow, to—

> "Supplant those rough rug-headed kerns
> Which live like venom, where no venom else,
> But only they, hath privilege to live."
> (*Richard II. Act II. sc.* 1.)

and subsequently arrived in Dublin, where he remained a fortnight, sumptuously entertained by the provost, as the chief magistrate of the city was then called; until, receiving intelligence of the invasion of his kingdom by the Earl of Hereford, "banished Bolingbroke," he returned to England, having previously committed the youthful Lord Gloucester and Henry of Lancaster (afterwards Henry V.) to Trim Castle, in the county of Meath. In 1404 the statutes of Kilkenny and Dublin were confirmed in a parliament held in the city by the Earl of Ormond. The attachment of the

City.

people of Dublin to the house of York induced them to acknowledge the impostor, Lambert Simnel, who was crowned as Edward VI. in the presence of the lord deputy and other of the chief authorities in Christ Church Cathedral. In the next year, 1486, after having performed the part of a sovereign in Dublin, he sailed from the city with 2000 German troops who had arrived with Lords Loval and Lincoln, together with some Irish auxiliaries, to invade England. In 1534 Lord Thomas Fitzgerald, or Silken Thomas as he was called, a young man of rash courage and good abilities, son of the Lord Deputy Kildare, believing his father, who was imprisoned in the tower of London, to have been beheaded, organized a rebellion against the English government, and marched with his followers from the mansion of the Earls of Kildare in Thomas Court, through Dame's Gate to St Mary's Abbey, where, in the council chamber, he proclaimed himself a rebel. On his appearing before the walls with a powerful force, the citizens were induced through fear to give admission to a detachment of his troops to besiege the castle; but, on hearing that he had met with a reverse in another quarter, they suddenly closed their gates and detained his men as prisoners. He then attacked the city itself; but finding it too strong to be seized by a *coup de main*, raised the siege on condition of having his captured soldiers exchanged for the children of some of the principal citizens who had fallen into his hands. After much vicissitude of fortune, Lord Thomas Fitzgerald and some others concerned in this rebellion were executed at Tyburn in 1536. At the breaking out of the civil war in 1641, a conspiracy of the Irish septs, under the direction of Roger Moore, to seize on Dublin Castle, was disclosed by one Owen Connolly on the eve of the day on which the attempt was to have been made, and the city was thus preserved for the king's party; but the native Irish without commenced an indiscriminate extermination of the Protestant population. "In a few days," says Sir John Temple, "the city was filled with the most lamentable spectacles of sorrow, which in great numbers wandered up and down in all parts, desolate, forsaken, having no place to rest their heads, no clothing to cover their nakedness, nor food to fill their hungry bellies: those sad creatures appeared like living ghosts in every street. The greatest part of the women and children thus barbarously expelled out of their habitations, perished in the city of Dublin; and so great numbers were brought to their graves as all the churchyards within the whole town were of too narrow compass to contain them, so that the lords justices took order to have two large pieces of new ground, one on each side of the river, taken in upon the out-greens, and set apart as burying places." In 1646 it was besieged, but without success, by the Irish army of 16,000 foot and 1600 horse, under the guidance of the pope's nuncio Ripaccini and others, banded together "to restore and establish in Ireland the exercise of the Roman Catholic religion." The city had been put in an efficient state of defence by the Marquis of Ormond, then lord-lieutenant; but in the following year, to prevent it falling into the hands of the Irish, he surrendered it on conditions to Colonel Jones, commander of the parliamentary forces. In 1649 Ormond was totally defeated at the battle of Baggotrath, near Old Rathmines, in an attempt to recover possession. The same year Oliver Cromwell landed in Dublin, as commander-in-chief under the parliament, with 9000 foot and 4000 horse, and proceeded thence on his career of conquest, which commenced with the capture of Drogheda by storm, and the subsequent massacre of its inhabitants. After the resignation of the government into the hands of his brother Henry by Richard Cromwell, the castle was surprised by a party of officers favourable to the royal cause; and though immediately retaken by Sir Hardress Waller, it was forced to surrender again in a few days. When James II. landed in Ireland in 1689, to assert his right to the British throne, he held a parliament in Dublin, which passed acts of attainder against upwards of 3000 Protestants. The governor of the city, Colonel Luttrell, at the same time issued a proclamation ordering all Protestants not housekeepers, excepting those following some trade, to depart from the city within 24 hours, under pain of death or imprisonment, and restricting those who were allowed to remain in various ways. In the hope of relieving his financial difficulties, the king erected a mint, where money was coined of the "worst kind of old brass, guns, and the refuse of metals, melted down together," of the nominal value of L.1,586,800, with which his troops were paid, and tradesmen compelled to receive it under penalty of being hanged in case of refusal. Under these regulations the entire coinage was put into circulation. After his defeat at the battle of the Boyne, James returned to Dublin, but left it again before daybreak the next day; and William III. advancing by slow marches, on his arrival encamped at Finglas, with upwards of 30,000 men, and on the ensuing day the king proceeded in state to St Patrick's Cathedral to return thanks for his victory. In 1783 a convention of delegates from all the volunteer corps in Ireland assembled in Dublin for the purpose of procuring a reform in parliament; but the House of Commons refused to entertain the proposition, and the convention separated without coming to any practical result. In May 1798 the explosion of a conspiracy planned by the United Irishmen to seize the city was prevented by the capture of Lord Edward Fitzgerald and other of the leaders. In 1800 the act of union between Great Britain and Ireland was passed in both parliaments, and on the 1st January following the imperial standard of the United Kingdom was hoisted on Dublin Castle. In 1803 another insurrection, headed by Robert Emmett, a young barrister of much promise, broke out, but was immediately quelled, with the loss of some lives in the tumult, and the death of its leaders on the scaffold.

The population of the city of Dublin was estimated by Rutter, in 1753, at 161,088; in 1798, by Whitelaw, at 182,037, and was ascertained by the census of 1821 to amount at that period to 185,881, and by the census of 1831 to 204,155. The population of the city, according to the most recent enumerations in 1841 and 1851, was as follows:—

Parishes.	Area.	Population in 1841.	Population in 1851.		
			Males.	Females.	Total.
Christ Church (Liberties of)	1 2 19	15	36	14	50

City.

The city is divided into 15 municipal wards. In 1851 the poor-law valuation for the city amounted to L.531,079, and the amount of Griffith's valuation, including property exempted from taxation, is L.594,886.

Dublin is the seat of the executive government, consisting of the viceroy or lord lieutenant, assisted by a privy-council indefinite in number, appointed by the crown, and a member of the House of Commons as chief secretary. In the absence of the lord lieutenant, his place is supplied by lords justices, generally the primate or archbishop of Dublin, the lord chancellor, and the commander of the forces. The lord lieutenant resides chiefly at the Viceregal Lodge in the Phœnix Park, and occasionally at Dublin Castle, which is used on state occasions. The Castle of Dublin is situate on high ground, formerly at the eastern extremity, but now in the centre of the city, dividing the ancient from the modern town on the south side of the Liffey. The building was commenced in the reign of King John, by the Lord Justice Fitzhenry, and completed in its original form by Henri de Londres, archbishop of Dublin. It was then a place of much strength, moated and flanked with towers; but the moat has been filled up, and most of the ancient structure removed at different periods to make way for the present patchwork palace, leaving as a memorial of the old castle the Record Tower, now used as the depository of the records of the office of arms, consisting of volumes of the pedigrees of the nobility and gentry of Ireland since the reign of Henry VIII., with records of their deaths, marriages, descents, &c. The Bermingham Tower, formerly a place of confinement for state prisoners, which was taken down in 1775 and rebuilt in 1777, also contains an extensive collection of ancient historical records, the keeper of which formerly received L.10 per annum, which sum was augmented to L.500 in favour of Addison when secretary to the Earl of Wharton, then lord lieutenant. The records are now in the custody of the officer of arms.

The building, as it exists at present, was chiefly erected in the eighteenth century; it is of great magnitude, covering altogether an area of about ten acres, but destitute in its exterior of architectural beauty or regularity of form. It is used as the town residence of the lord lieutenant and the principal officers of state, and a very considerable portion occupied by the offices more immediately connected with the administrative government, including those of the ordnance and metropolitan police. The chief objects of interest in the castle are the ball-room, 82 feet in length by 41 feet in breadth, and 38 feet in height, called St Patrick's Hall, since used as the place of investiture of the knights of St Patrick; the Castle Chapel, an elaborate Gothic building of the present century, erected at an expense of L.42,000; and the Arsenal and Armoury, in the lower castle yard, containing arms for 60,000 men.

Dublin is also the seat of the Irish courts of law and equity, from which an appeal lies only to the House of Lords. The judicial functions are exercised by the lord chancellor, the master of the rolls, and four judges in each of the courts of Queen's bench, common pleas, and exchequer. There are also judges of the courts of prerogative and admiralty, two judges in the bankruptcy court, one in the insolvents' court, and a chairman of quarter sessions; besides a court of commissioners for the sale and transfer of encumbered estates in Ireland, a civil bill court presided over by the recorder, several manor courts, and a borough record court for the trial of all records where the debt shall amount to L.20, and for the issuing of attachment against goods, &c.

The building called the Four Courts, in which the superior courts are held, stands on the site of the ancient Dominican monastery of St Saviour, on King's Inn Quay. It is an extensive and magnificent structure, erected after a design of Mr Thomas Cooley between the years 1786 and 1800, at the enormous cost of L.200,000.

The prerogative, consistorial, and admiralty courts are held in the King's Inns, a massive imposing structure in the northern portion of the city, erected after a design of Mr Gandon, the architect of the Custom-House. Those parts of Dublin not under the civil magistrates are the manor of Grangegorman, which includes a district in the neighbourhood of Glasnevin and Mountjoy Square, of which the dean of Christ Church is the lord, and appoints a seneschal, who holds his court in a private house;—the manor of Thomas Court and Donore, granted to an ancestor of the Earl of Meath, on the dissolution of the monastery to which it had been appended: its court was first established in the reign of King John, and still continues open for trial of petty debts and offences;—the manor of St Sepulchre, including the parishes of St Kevin and St Nicholas Without, of which the archbishop of Dublin is lord, with extensive powers now become obsolete. It has a court-house and prison attached to it. The grounds immediately adjoining the cathedrals of Christ Church and St Patrick were formerly exempt jurisdictions, subject to their respective deans; but their authority is now nominal.

Boards of commissioners having charge of the principal branches of revenue formerly sat in Dublin, but have been removed and merged in those sitting in London, the details here being superintended by subordinate officers. The offices of the boards of customs and excise were in the old Custom-House erected in 1707, and situated in Essex Street; the Stamp-Office was in a building in William Street, once the private mansion of the Earl of Powerscourt. The business of these departments, together with that of the Irish poor-law commission, is transacted in the present Custom-House, architecturally one of the chief ornaments of the city. It was erected at a cost of about L.400,000, after a design of Mr James Gandon, and opened in 1791. This magnificent structure, which stands on the north side of the river below Carlisle Bridge, presents four fronts, three of which may be seen to advantage. The south front, facing the river, 375 feet in length, is built of Portland stone, finished in the Doric order, with an entablature and bold projecting cornice. The other three fronts are composed of granite, and from the centre rises a dome to the height of 125 feet, after the model of that of Greenwich Hospital, surmounted by a somewhat awkward figure intended as an emblem of Hope.

Previous to the operation of the Municipal Reform act, the municipal government of the city was vested in the lord mayor, two sheriffs, a board of twenty-four aldermen, and the common council elected every three years by the twenty-five guilds of trades, in numbers proportioned to the estimated importance of each guild; beside which, every person who had served the office of sheriff had a seat in the commons for life under the name of sheriffs' peer. In the city assembly, the sheriffs, who were chosen annually from among the representatives of guilds, presided. The aldermen were chosen by the common council, and held office during life. The lord mayor was elected annually by the aldermen, generally according to seniority, and approved and sworn in by the lord lieutenant at Michaelmas.

The chief magistrates were originally styled provosts and bailiffs, the former of which titles was changed for that of mayor in 1409, and the bailiffs transformed into sheriffs in 1547. In 1660 Charles II. granted to the mayor a golden collar, a company of foot, and the right of having a sword of state, a mace, and cap of dignity. In 1665 the title of lord mayor was conferred, and L.500 per annum granted in lieu of the foot company. The Tholsel, a corruption of toll-stall, was built in 1682 as the place of assembly of the corporation, but was taken down in 1807, and the City Assembly House in William Street adopted in its stead.

Every third year, by virtue of an old charter, it was compulsory upon the lord mayor and twenty-four corporations to perambulate the city and its liberties for the purpose of maintaining the ancient boundaries. This ceremony was called riding the franchises, and fell into decay towards the close of the last century, all necessity for it having ceased.

"The vigilance of the Dubliners in ancient times was principally to be exercised against their ecclesiastical neighbours of St Mary's Abbey, Kilmainham, Thomas Court, and St Sepulchre's, the latter being the liberty of the Archbishop of Dublin. Various were the disputes and feuds about their respective boundaries, and many are the charters and inquisitions defining them, which are still extant. To guard themselves from encroachment, the citizens from time immemorial perambulated the boundaries of their chartered district every third year, and this was termed 'riding their franchises,' corrupted into 'riding the fringes.' In ancient times, when the ecclesiastics were a powerful body, this was a very necessary ceremony, and in some measure a dangerous service. The worthy citizens went forth 'well horsed, armed, and in good array;' and so they are described in an account of this ceremony in 1488, still extant in the book of Christ Church. But when the power and possessions of their clerical neighbours passed away, there was no one with the will or the means to interfere with them. The citizens had long ceased to march out with a black standard before them—

City.

'a great terror to the Irish enemies;' and their military spirit having completely died away, the riding of the franchises became altogether a peaceful exhibition of civic pomp, consisting chiefly of the following emblematic personages, and display of craft:—

"Every one of the twenty-five corporations was preceded by a large vehicle, drawn by the most splendid horses that could be bought or borrowed; indeed all were eager to lend the best they had. On these carriages were borne the implements of the respective trades, at which the artisans worked as they advanced. The weavers fabricated ribbons of various gay colours, which were sent floating among the crowd; the printers struck off hand-bills, with songs and odes prepared for the occasion, which were also thrown about in the same manner; the smiths blew their bellows, hammered on their anvils, and forged various implements; and every corporation, as it passed, was seen in the exercise of its peculiar trade. They were accompanied by persons representing the various natures or personages of their crafts, mixing together saints and demigods, as they happened to be sacred or profane. Thus, the shoemakers had a person representing St Crispin with his last; the brewers, St Andrew with his cross; but the smiths, though patronized by St Loy, were accompanied by Vulcan and Venus, which last was the handsomest woman that could be procured for the occasion, and the most gaily attired. She was attended by a Cupid, who shot numerous darts, *en passant*, at the ladies who crowded the windows. The merchants, who exist under the patronage of the Trinity, could not without profanation attempt any personal representation; but they exhibited a huge shamrock as the emblem furnished by St Patrick himself, while they were also accompanied by a large ship on wheels navigated by *real* sailors.

"The course of proceeding of this motley assembly was this: they drew up at the old custom-house, and passing along Temple Bar and Fleet Street, they came to the sea at Ringsend. They then proceeded to low-water mark, when a trumpet was sounded, a water bailiff advanced, and, riding into the water as far as he could, hurled a spear eastward. This marked the eastern boundary of the city. They then crossed the Strand, and traversing the boundaries of the city and county, by Merrion, Bray Road, Donnybrook, &c., came by Stephen's Green to the division between the city and liberties. Then traversing Kevin's Port, Bolton Lane, Bride Street, Bull Alley, &c., they again emerged at Dolphin's Barn, from whence they took a round by Stonybatter, Finglass, Glasnevin, and Clontarf, ending a little beyond Raheny. In the course of this peregrination they passed through several houses, and threw down any fences that came in their way, particularly on the confines of the liberties."—(*Ireland Sixty Years Ago*, 3d edition.)

For the purposes of police, the city was, previous to 1830, divided into four districts, in each of which there was an office, at which three magistrates, one an alderman, the second a common councilman, and the third a barrister, all appointed by the crown, sat daily. They had under them an armed force, consisting of 52 peace officers, 30 mounted and 170 dismounted police, and 650 night-watchmen.

"The first appointment even of a permanent night-watch was in 1723, when an act was passed under which the different parishes were required to appoint 'honest men and *good Protestants*' to be night-watches. The utter inefficiency of the system must have been felt; and various improvements were from time to time attempted in it, every four or five years producing a new police act—with how little success every one can judge, who remembers the tattered somnambulists who represented the 'good Protestant watchmen' a few years ago."

Somewhat more than half a century since, the city of Dublin was one of the most turbulent in Europe. Similar feuds to those which have occasionally sprung up in many other cities existed in Dublin, and, as was commonly the case elsewhere, the butchers formed one party, the other was formed by the Liberty boys, or tailors and weavers of the Coombe. The author of the interesting and graphic little book, entitled "Ireland Sixty Years Ago," states that—

"It is in the memory of many now living that the streets, and particularly the quays and bridges, were impassable in consequence of the battles of these parties. The weavers, descending from the upper regions beyond Thomas Street, poured down on their opponents below; they were opposed by the butchers, and a contest commenced on the quays which extended from Essex to Island bridge. The shops were closed; all business suspended; the sober and peaceable compelled to keep their houses; and those whose occasions led them through the streets where the belligerents were engaged were stopped, while the war of stones and other missiles was carried on across the river, and the bridges were taken and retaken by the hostile parties. It will hardly be believed that for whole days the intercourse of the city was interrupted by the feuds of these factions. The few miserable watchmen, inefficient for any purpose of protection, looked on in terror, and thought themselves well acquitted of their duty if they escaped from stick and stone.

City.

"These feuds terminated sometimes in frightful excesses. The butchers used their knives, not to stab their opponents, but for a purpose then common in the barbarous state of Irish society, to *hough* or cut the tendon of the leg, thereby rendering the person incurably lame for life. On one occasion, after a defeat of the Ormond boys, those of the Liberty retaliated in a manner still more barbarous and revolting. They dragged the persons they seized to their market, and, dislodging the meat they found there, hooked the men by the jaws, and retired, leaving the butchers hanging on their own stalls."

Recently, however, the vital importance of an efficient police has been recognized, and in 1836 the act 6th and 7th Will. IV., cap. 29, established the present metropolitan police force, consisting of about 1150 officers and men, including seven divisional superintendents, altogether maintained at a cost of L.74,000 per annum, paid out of funds arising from police rate, carriage and pawnbrokers' licenses, &c., together with an annual parliamentary grant of L.37,000. There are two police commissioners, whose salaries are paid out of the consolidated fund, and under whose control the police are placed, the corporation having no authority over them. There are three police courts, presided over by six magistrates, in Dublin; and a court with one magistrate is held in Kingstown, which is within the jurisdiction of the Dublin metropolitan police commissioners.

A large military force is usually maintained in the city of Dublin, which is the headquarters of the military district of Dublin, and of the staff of Ireland, consisting of the commander of the forces, adjutant-general, and quartermaster-general. The troops are accommodated in several barracks, the most extensive of which is the Royal Barracks, erected in 1704, and subsequently enlarged, consisting of five squares, affording quarters for 10 field officers, 83 officers, 2000 non-commissioned officers and privates, and 460 horses, together with an hospital for 260 patients. Richmond Barracks, for infantry, occupies an elevated healthy situation, on the banks of the Grand Canal, beyond Kilmainham, forming a neat substantial fabric, with extensive courts and yards, covering altogether an area of 14 Irish acres, and furnishing accommodation for 76 officers and 1600 noncommissioned officers and privates, stabling for 25 horses, and an hospital for 100 patients. Portobello Barrack, for cavalry and artillery, is on the bank of the same canal, near Harold's Cross. At Island Bridge, near Kilmainham, there is an extensive artillery barrack, and one for artillery and infantry at the Pigeon House Fort in the bay. Besides these, there are barracks for infantry in Great Ship Street, near the castle, at Aldborough House, a fine massive building erected in 1765 at a cost of L.45,000, on the North Circular Road and in the Linen Hall. The two latter were first used for military purposes in 1848. In the Phœnix Park is Mackenzie's Fort and magazine.

The prisons of Dublin, which were formerly ill conducted, badly arranged, and stored with abuses calculated still further to debase and harden their inmates, are now managed upon the improved principles in vogue at the present day. Besides the county gaol at Kilmainham, there are four convict prisons which are under the control of the Directors of Government Prisons, the Richmond Bridewell, and the Marshalsea of the Four Courts.

Mountjoy Government Prison, a model prison for the reformation of convicts, is conducted on "the separate system," which admits of any amount of communication not considered directly evil, the only prohibition with respect to the intercourse of prisoners with their fellow men being that which cuts them off from association with other criminals. The number in custody is about 900 annually, who are principally drawn from the other convict depôts, especially from Spike Island, and a few directly from the county gaols. The average duration of the detention of convicts in this prison exceeds ten months, and they are afterwards removed to Spike Island, the Dublin depôts, or by transport ships to convict stations abroad. Each prisoner being submitted previous to admission to a strict medical examination, there is not much disease prevalent in this institution, and no instance of mental disease has occurred since the opening of the prison. The annual cost of officers' salaries and maintenance of prisoners is slightly above L.8000, which is reduced to about L.7000 by the earnings of the inmates.

The prison of Newgate, in Green Street, was opened in 1781, having been built from a design of Mr Thomas Cooley, the architect of the Four Courts and the Exchange, at an expense of about L.16,000. It was built to supply the place of the Old Gaol in the Corn Market which had fallen into decay, and is one of those dis-

mal, heavy structures which were formerly considered as models of prison architecture, when no other method of discouraging crime was believed to exist but punishment and terror. It is not without its melancholy historical interest, several gentlemen having been executed there in expiation of the crime of high treason during the rebellion of 1798; in which year also the unfortunate Lord Edward Fitzgerald expired within its walls in a state of phrenzy, from the effects of wounds received on the occasion of his arrest by the late Major Sirr. Originally it was intended for prisoners of every description; but in consequence of the numbers by which it was thronged its use was circumscribed. It is now used as one of the government prisons for the reception of convicts; and notwithstanding the defects of its original construction, which cannot be wholly obviated, the arrangements are such as to secure a constant and regular supervision; and the whole establishment is conducted with strict regard to discipline, and an efficient course of industrial training. The gross total annual cost of officers' salaries and maintenance of prisoners is about L.3500, and the number of prisoners in custody about 500 per annum.

The Richmond Penitentiary is an extensive pile of building in Grangegorman Lane, erected to prevent the necessity for transportation, being intended for convicts sentenced to long periods of punishment. It was under the immediate control of the government, by whom the gaoler and other officers were appointed. The experiment did not at first succeed. An inquiry into its internal management disclosed several grave abuses, which led to the dismissal of the gaoler; and afterwards, in 1832, the building was used for a cholera hospital, but is now again appropriated as a receptacle for female convicts, under the name of the Grangegorman Female Convict Depôt; the prisoners being employed in washing for the other government prisons in Dublin, sewing, knitting, spinning, and embroidery.

Juvenile offenders were formerly sent on conviction to the house of correction in Smithfield, which is now, under the name of the Smithfield Government Prison, a convict depôt. It is unfortunately situate in a densely crowded and low district, and affords very limited accommodation. The prisoners are furnished with employment: the principal trades carried on are shoemaking and mat-making, the work manufactured being disposed of for cash or appropriated to prison use.

The Four Courts' Marshalsea receives prisoners both from the city and from all Ireland. It is situated on a rising ground near Thomas Street, and was built to replace the wretched den on Merchants' Quay formerly appropriated to the same purpose.

The Old Sheriffs' Prison in Green Street is intended for all cases of debt above L.10 contracted within the city. Previously to its erection in 1794, debtors were detained in the residences of the bailiffs, commonly called spunging-houses, a custom which occasioned many gross abuses. For some time also after the opening of this prison, the keeper was partly remunerated by the rents of the apartments. The abolition of prison fees put an end to that abuse. It is not now used as a prison, having of late years been a branch of the North Dublin Union Workhouse, and more recently offered for sale to the government by the corporation of the city of Dublin.

The City Marshalsea, a mean building adjoining the Sheriffs' Prison, was appropriated to debtors in sums of less than L.10, under decrees of the lord mayor's court and the court of conscience. The prisoners were generally of the poorest classes, and many of them had no resource but casual charity for the support of life; even a lodging in the common hall had to be purchased at the rate of a penny a-night. This and the Sheriffs' Prison are now happily extinct, leaving the Four Courts' Marshalsea as the debtors' prison.

The County Gaol, a spacious and well-arranged prison, is at Kilmainham.

It is only of late years that any provision has been made by government for the relief of the poor of Ireland, and the penal enactments against mendicity were consequently of no effect. There were formerly houses of industry, mendicity institutions, and various substitutes for a national provision, but ultimately it was acknowledged that civilization might long exist on the surface of society without penetrating its depths, and that the only security for the existence of a well-ordered community was to be obtained by the formation of an organized substratum which could extract vice and poverty, and restore life and vigour to the mass of the population. Shortly after the establishment of the new efficient system of police, and the national system of education, the law for the relief of the poor in Ireland came into operation, and the city was divided between the North and South Dublin Unions, which also include a portion of the county contiguous to the city. The North Dublin Union Workhouse in Brunswick Street was formerly a portion of the House of Industry which was opened in 1773, with a grant of L.4000 from parliament, but now supported as an hospital by subscriptions and occasional grants from parliament. The South Dublin Union Workhouse was formerly an asylum for the destitute and insane poor, and afterwards the Foundling Hospital until converted to its present use in 1840.

The city is within the ecclesiastical province and diocese of Dublin. The province includes the dioceses of Dublin, Kildare, Ferns, Leighlin, Ossory, Cashel, Emly, Waterford, Lismore, Cork, Cloyne, Ross, Killaloe, Kilfenora, Clonfert, Kilmacduagh, Limerick, Ardfert, and Aghadoe. The diocese of Dublin comprises the entire county, most of the county of Wicklow, part of the Queen's County, and of the counties of Kildare and Wexford. The archbishop exercises spiritual jurisdiction over the two cathedrals of Christ Church and St Patrick. Of these the former claims the priority by right of antiquity. Its foundation is attributed to the Danes in 1038, but it dated its erection as a church from 1038, and its elevation to a deanery and chapter from 1541. The entire length of the nave and choir is 260 feet, that of the transept 110 feet; the extreme breadth of either 80 feet. It stands nearly in the middle of the old city, on the northern declivity of the hill, in a favourable situation for effect if entirely freed from the neighbouring wretched habitations. This cathedral does not contain many monuments. Among the most interesting is that of Strongbow, the invader of Ireland, whose tomb was long the place at which the tenants of the church were accustomed to pay their rents. The monument was injured by the fall of one of the cathedral walls; but was afterwards repaired, and is still to be seen in good preservation, with a smaller tomb by its side, supposed to be that of Strongbow's son who was killed by his father. Several fine monuments are in the aisle; and in the chancel is that of the nineteenth Earl of Kildare, father of the first Duke of Leinster. Synods were occasionally held in this church, and parliaments also, before the Commons' Hall was destroyed in 1596 by an explosion of 144 barrels of gunpowder which were arranged in Winetavern Street, after having been landed on Wood Quay, and by some accident ignited. Here also the impostor Lambert Simnel was crowned. Under the same roof with the cathedral is a small building called St Mary's Chapel. The chapter consists of the dean, precentor, chancellor, treasurer, the three prebendaries of St Michael, St Michan, and St John, and six vicars choral. The cathedral is well endowed. Its economy fund is applied to the payment of the dignitaries and officers, and to the maintenance of the structure, which has undergone a thorough repair, both internally and externally. The deanery-house was in Fishamble Street, which, being considered a situation unsuitable to a dignitary of the establishment, was sold, and is now a merchant's warehouse. The cathedral of St Patrick was founded in 1190 by John Comyn, archbishop of Dublin, in a very low situation, subject to the bad effects of floods, by which it is liable to be inundated. About a hundred years after its first erection it was burnt, but was again raised from its ruins in increased splendour. At the Reformation it was dissolved, and the building used for some of the purposes of the courts of justice. King Edward projected its change into a university. Sir John Perrott, the lord deputy, having reported that there were two cathedrals in the city, "this one dedicated to St Patrick being had in more superstitious reputation than the other ought to be dissolved;" but the project was defeated, a university established elsewhere, and in the succeeding reign of Mary St Patrick's Cathedral was restored to its primary destination. The installations of the knights of St Patrick, the first of which took place in 1783, were originally held here, but now St Patrick's Hall in the castle is used for the investiture of the knights of that order. This cathedral contains the monuments of several illustrious persons, among which the most celebrated, not so much for the execution of the sculpture as for the more durable fame of the characters they commemorate, are those of Dean Swift, who left by will the following epitaph—"Hic depositum est corpus Jonathan Swift, S.T.D., hujus Ecclesiæ Cathedralis Decani, ubi sæva indignatio ulterius cor lacerare nequit; abi, viator, et imitare, si poteris, strenuum pro virili libertatis vindicatorem;" of Mrs Hester Johnson, immortalized under the name of Stella; of Archbishop Marsh, who bequeathed a fine library to the public; of the first Earl of Cork; and of Duke Schomberg, who fell at the battle of Boyne. The chapter consists of the dean, precentor, chancellor, treasurer, the two archdeacons of Dublin and Glandelagh, nineteen prebendaries, four minor canons, and twelve vicars choral. The singing men of these cathedrals perform conjointly at both, and at the chapel of Trinity College, at different hours on Sun-

City.

days; so that it may be said there is only one choir in Dublin; but that one, from the combination of musical talent, is excellent. The deanery house is in the immediate vicinity of the church. Sir James Ware, who wrote in the reign of Charles I., pronounces this cathedral to be superior to all others in Ireland for magnificence of structure and for extent. It is remarkable for its undeviating adherence to the early English pointed style of architecture, and the state of neglect into which it had been allowed to sink. "I never saw a church in such a discreditable state," says Sir John Forbes,—"one part of it may be literally said to be converted into a dovecot, as its roof is filled with pigeons, and its floor in a state not to be described." It is now undergoing repair with as much rapidity as the funds at command for the purpose will allow. Some of the parish churches possess strong claims to admiration. St George's is a fine insulated Grecian fabric, with a noble Ionic portico and highly ornamented spire, 200 feet in height, erected in 1802, from design of Francis Johnston, Esq., at a cost of L.40,000. St Andrew's, commonly called the Round Church, from its elliptical form, is remarkable for a statue of its patron saint over the entrance; this being the only instance of a statue erected in such a locality in Dublin. St Michan's is of ancient foundation, being previous to 1700 the only parish church north of the Liffey, but rebuilt in 1676, in the pointed Gothic style, and since so much altered that nothing but the square tower of the older building remains. The vaults of St Michan's are remarkable for an antiseptic quality, which preserves the relics deposited there from decay.

St Thomas's Church in Marlborough Street is a singular specimen of compound architecture, erected in the middle of last century.

St Mary's Church, in Mary Street, built in 1697, has no architectural merit, and the other parish churches have few pretensions to notice.

The Roman Catholic Archbishop of Dublin also resides in the city. The metropolitan church, in Marlborough Street, is considered as more peculiarly under his charge. This is a building of great dimensions, highly ornamented internally in the Grecian style, and having a fine Doric portico forming the principal front in Marlborough Street, but placed in a situation unworthy of its architectural merit. The building, which stands on the site of Annesley House, was commenced in 1816 at an estimated cost of L.52,000. The number of Roman Catholic parish churches is twelve, all large, but few externally elegant; a circumstance easily accounted for by the fact, that previously to the year 1745 the strict enforcement of the penal laws prohibited the public exercise of their form of worship. The relaxation of the law was occasioned by the falling in of the floor of an upper apartment, where a Catholic congregation had assembled to celebrate mass secretly, and by which several lives were lost. After this accident, Lord Chesterfield, then lord lieutenant, declined further to enforce the statute, and the prohibition was removed.

St Paul's Roman Catholic chapel on Arran Quay is an elegant building in the Ionic style. The church of St Francis Xavier was erected at a cost of L.18,000 from a Roman Ionic design of the Rev. B. Esmonde. The Catholic places of worship have ever since been kept open without molestation; but the apprehensions of their pastors, and the jealousy of the ruling powers, induced them formerly to select places of comparative privacy for their erection. The interior of the chapels in Anne Street, Exchange Street, and Westland Row, are worthy of inspection. Besides the parochial chapels, there are seven belonging to friaries of the Franciscans, the Calced and the Discalced Carmelites, the Capuchins, the Dominicans, the Augustinians, and the Jesuits; and several belonging to nunneries,—viz. two of Discalced Carmelites, one of Poor Clares, two of the Presentation, one of the Sisters of St Dominick, one of the Sisters of Mercy, and three of the Sisters of Charity; besides various others in the neighbourhood of the city.

The Presbyterian meeting-house on Ormond Quay, in a prominent situation, is an elegant building in the Gothic style, erected in 1845, by means of a bequest for the purpose made by Mrs Magee. Protestant Dissenters are not numerous in Dublin. There are congregations of Presbyterians, Independents, Methodists, Quakers, Seceders, Baptists, and Moravians. The few Jews resident in Dublin have a synagogue in Mary's Abbey.

The centesimal proportion of the number of places of worship is about 45 for the Episcopalian churches, 35 Roman Catholic and 20 Dissenters. These figures do not give material for any accurate estimate of the number of each persuasion, on account of the very different size of the buildings and the number of services performed.

City.

Each of the parish churches has a cemetery attached to it, in which the parishioners of every religious persuasion were interred, until the restraints imposed on Catholics by the law called the Burial Casement act, as to performing their burial service over the dead, obliged them to open two large cemeteries, the one at Golden Bridge, the other at Glasnevin. The vaults of the newly built Roman Catholic places of worship are also appropriated to the reception of the dead. The Protestants also have a cemetery at Harold's Cross, called Mount Jerome cemetery, comprising twenty-five acres of land laid out with a view to ornamental effect.

Dublin has had its full share of the benefits arising from improvements in education. As early as the year 1311 a university was erected in it, under a bull of Clement V. in St Patrick's Church; but it gradually declined, until it became virtually extinct at the close of Henry VII.'s reign. After the Reformation, Sir Henry Sidney and Sir John Perrott exerted themselves to convert that cathedral into a university; but they were overruled by Archbishop Loftus, who protested successfully against what he deemed an encroachment on the rights of the church. In lieu of it, however, he prevailed on the corporation of Dublin to apply the dissolved monastery of All Saints or All Hallows, in Hoggins', now College Green, to the same purpose. Hence arose the University of Dublin, which is a college incorporated by charter or letters patent, 34 Eliz. (1591), as "The Mother of an University."

In the charter of foundation the Queen nominated one provost, three fellows, *nomine plurium*, and three scholars, *nomine plurium*, to constitute with their successors for ever a body corporate and politic, under the name of The Provost, Fellows, and Scholars of the Holy and Undivided Trinity of Queen Elizabeth, near Dublin. The number of the corporation has been increased from time to time, and at present consists of a provost, seven senior fellows, twenty-eight junior fellows, and seventy scholars. The system of instruction is superintended by the fellows, both senior and junior, together with professors in the various departments of science and literature. A vacancy among the fellows is filled up by the provost and a select number of the fellows, after a strict examination for four days in metaphysics, mathematics, natural philosophy, ethics, history, chronology, Latin, Greek, and Hebrew. They hold their situation during life, unless they choose to accept of the incumbency of one of the thirty-two benefices at the disposal of the college. Until the year 1840, all the fellows were bound to celibacy, but that restriction was then removed. The scholars are chosen from among the undergraduates, after an examination in Greek and Latin. They hold their situation till they can attain the degree of master of arts. Students, after an examination in Greek and Latin, are admitted as fellow-commoners, pensioners, or sizars; which last class is limited to thirty, and is partially maintained out of the College funds. Noblemen, noblemen's sons, and baronets, have the privilege of forming a separate order with peculiar advantages, on the payment of additional charges. The course of general instruction extends over four years, the principal studies of each year being successively mathematics, logic, natural philosophy and astronomy, and ethics; and two commencements are held every year for the purpose of conferring degrees. A medical school has been long attached to the university, to which has lately been added a school of civil engineering; and diplomas in surgery and civil engineering are granted by the board on the completion of the prescribed courses. The library consists of about 106,000 printed volumes, and 1500 manuscripts; and the number is increased annually by about 1500 vols., which are partly purchased and partly obtained under the copyright act. There is also a botanic garden at Ball's Bridge, and a museum. The funds of the College, arising from lands and the fees of the students, are managed solely by the provost and seven senior fellows, who form a board, to whom the whole government of the university, both in its executive, and, so far as the statutes permit, legislative branches, is committed. The buildings, which include a large extent of ground, now nearly in the middle of the city, consist of one very large and two smaller squares. In

these are the chapel, the theatre for examination, the museum, the library, the dining hall, the printing office, and chambers for the fellows and students. Attached to the buildings is a large space planted for the recreation of the students, and a smaller inclosure for the provost and fellows. The provost's residence and the medical school are apart from the main body of the buildings.

The College Observatory is at Dunsink, about five miles N.W. of Dublin; it is amply furnished with astronomical instruments. It was endowed by Francis Andrews, Esq., LL.D., provost of Trinity College, erected in 1785, and placed in 1791 by statute under the management of the "Royal Astronomer of Ireland," an appointment first filled by Dr Henry Ussher, and subsequently by Dr Brinkley, Bishop of Cloyne. The Magnetical Observatory of Dublin was erected in the years 1837–8, in the gardens attached to Trinity College, and at the expense of the university. A regular series of observations was begun in 1838, and has been continued ever since.

By letters patent, dated 15th August 1850, a university called "The Queen's University in Ireland" was founded, with powers to grant degrees in the faculties of arts, medicine, and law, to students who have completed their studies in any one of the Queen's colleges of Belfast, Cork, or Galway. The university consists of a chancellor and senate, nominated by the crown, and to hold office during pleasure, to be a corporation with perpetual succession, with power to sue and be sued, to make bye-laws, to use a common seal, and to hold lands, the annual profits of which may amount to not more than L.10,000. One or more visitors to be occasionally appointed by the crown. The senate meets at Dublin Castle, for holding examinations and granting degrees pursuant to such examinations; the examiners are appointed annually by the senate. The three Queen's colleges to be colleges of the university, and their professors to be professors of the same; but the colleges not to be under the jurisdiction of the senate, farther than as regards the regulations for degrees in the faculties above mentioned. The senate of the university held its first meeting in June 1851.

During the short reign of James II. a college for Roman Catholics was opened in Back Lane, but was extinguished on his abdication; and in 1854 the Roman Catholic University was established in Stephen's Green.

The Inns of Court were intended for the instruction of law students. Collet's Inn, the first appropriated to this purpose in the reign of Edward I., having been erected without the city walls, was destroyed, together with the king's exchequer, by an incursion of the Irish from the Wicklow Mountains. The inns were revived during the reign of Edward III. in a building near the castle, given by Sir Robert Preston, chancellor of the exchequer, and thence called Preston's Inns, where the institution was maintained for upwards of two centuries. But the society being dispossessed in consequence of a flaw in the title, the inns were removed to the dissolved monastery of St Saviour's, where the four courts now stand, and there took the name of King's Inns. These buildings having been suffered to fall to ruin, a new site was chosen in the northern extremity of Dublin, and a massive but elegant building erected from a design by Mr Gandon the architect of the Custom-House. The principal apartments are the dining-hall and the library, which latter forms a detached building, erected in 1827 at a cost of L.20,000. Law students are obliged to attend terms here for two years previously to being allowed to practise as barristers; but as no arrangements have been made for literary instruction beyond the use of the library, punctuality of attendance is ascertained solely by their presence in the dining-hall, and therefore they are facetiously said "to eat their way to the bar."

There is no classical school on a public foundation similar to the grammar-schools of Westminster and London, but the city is not deficient in means of instruction, as private schools and institutions for the education of the poor are numerous.

In 1833 the grants of public money for the education of the poor were intrusted to the charge of the lord lieutenant, to be expended on the instruction of the children of every religious denomination, under the superintendence of commissioners appointed by the crown, and named "The Commissioners of National Education." The principles on which the commissioners act are, that the schools shall be open alike to Christians of every denomination; that no pupil shall be required to attend at any religious exercise, or to receive any religious instruction which his parents or guardians do not approve, and that sufficient opportunity shall be afforded to the pupils of each religious persuasion to receive separately, at appointed times, such religious instruction as their parents or guardians think proper. This system of united education is one which does not exclude children of any denomination, while it admits to a participation of its benefits those of every religious creed who may wish for instruction without interfering with any conscientious scruples.

In 1845 the commissioners were incorporated under the name of "*The Commissioners of National Education in Ireland*," with power to hold lands to the yearly value of L.40,000, to purchase goods and chattels, to receive gifts and bequests to that amount, to erect and maintain schools where and as many as they shall think proper, to grant leases for three lives or 31 years, to sue and to be sued by their corporate name in all courts, and to have a common seal, a power being vested in the lord lieutenant to fill up vacancies, to appoint additional members provided the total number does not exceed 15, and to remove members at his pleasure.

The school of medicine is partly under the control of the board of Trinity College, which nominates and maintains professors of anatomy and surgery, chemistry, and botany, and partly under that of the College of Physicians, which nominates the professors of the practice of medicine, of the institutes of medicine, and of materia medica and pharmacy, which latter are on the foundation of Sir P. Dun. To these have been added by the university a professorship of surgery, and by the King and Queen's College of Physicians professorships of midwifery and medical jurisprudence. The College of Physicians was first incorporated by charter of King Charles II. in 1667, and incorporated by William and Mary in 1692. It enjoys some important privileges; among others, the right of inspecting the shops and stores of apothecaries, druggists, and chemists, and of destroying drugs of bad quality. The college consists of thirty-six fellows, on whom the management devolves; of honorary fellows, who are excluded from any interference with the financial arrangements; and of licentiates, who, though not entitled to take any part in the management of the collegiate concerns, are summoned on occasions of importance. The College Hall is in Sir Patrick Dun's Hospital.

Surgery was long considered in Ireland, as well as in England, as a trade, the practitioners being included in the worshipful corporation of barber-surgeons. Nor was it till 1784 that a charter, founding a college of surgery, put the practice of that inestimable art on a basis enabling it to advance in a manner suited to the wants and character of a civilized nation. The college, which was at first held in an obscure building near Mercer's Hospital, has been removed to an elegant range of buildings in St Stephen's Green, commenced in 1806, and erected at a cost of L.25,000. Under the direction of the Royal College of Surgeons is a school of surgery, where lectures on the different branches of the art are delivered by the professors. The college building contains a board room, an examination hall, a library, and three museums.

The governor and company of the Apothecaries' Hall, founded by act of parliament in 1791, also had some share in the completion of a medical education, by means of courses of lectures and examinations on chemistry and pharmacy at their school of medicine in Cecilia Street, now discontinued, and the building sold to the Roman Catholic University, to be applied hereafter to purposes of medical education. In Peter Street is the Dublin School of Medicine: the attendance on the lectures delivered here is as a qualification for examination by the Queen's University in Ireland, the universities of London, Glasgow, Aberdeen, and St Andrews; by the Royal College of Surgeons of Ireland, England, Edinburgh, and Glasgow; by the Apothecaries' Halls Dublin and London, and by the army medical and navy boards. Practical anatomy, taken in this school with hospital attendance, constitutes an "*Annus Medicus*" for the Edinburgh University. There are also the Carmichael School of Anatomy in North Great Brunswick Street, and the Original Theatre of Anatomy and School of Medicine and Surgery in Peter Street.

Hospitals or asylums for various cases of disease and classes of persons are numerous, and liberally supported.

Lunatics are maintained in St Patrick's Hospital, founded in 1745, pursuant to the will of the celebrated Dean Swift,

City.

and conducted by governors appointed under the charter of incorporation. The General Lunatic Asylum, erected near the House of Industry, and placed under the care of officers appointed by government, originally received patients from all parts of the country; but, under an act of parliament, its use is now limited to a district consisting of the counties of Dublin, Louth, Meath, and Wicklow, each of these contributing towards its expenses in proportion to the number of patients sent in. Besides these public establishments for the recovery and safe custody of lunatics, there are in the vicinity of Dublin various private asylums for the insane.

The principal institution for the blind is Simpson's Hospital, founded by a merchant of Dublin, who had laboured under severe affections of the eyes and gout. The income is upwards of L.2500 per annum, by which fifty patients, either blind or gouty, are maintained, in a large plain edifice, situate in Great Britain Street. The apartments can accommodate a hundred inmates. The Richmond National Institution in Sackville Street was founded in order to instruct the blind in some of the more useful handicraft occupations. The principal branches taught are weaving, netting, and basket-making. The Molyneux Asylum, opened in Peter Street, in a large building which had been an amphitheatre for equestrian exhibitions, is confined to blind females, of whom those above the age of fifty have in it a permanent asylum, while those under that age are admitted to a temporary residence, until they can procure a permanent livelihood elsewhere. There is a commodious Episcopal chapel attached to this establishment. An institution for the maintenance and education of children born deaf and dumb is maintained at Claremont, near Glasnevin. The plan of the Royal Hospital, for decayed and maimed soldiers, was first suggested by the Earl of Essex, when lord lieutenant, and carried into effect through the repeated applications of the Duke of Ormond to Charles II. The site chosen for it had been the ancient priory of Kilmainham, founded by Strongbow for Knights Templars. Upon the extinction of that order, and the confiscation of its property, which was effected by a simultaneous and secret movement of all the crowned heads in Europe, this part of their possessions was transferred to the Knights of St John of Jerusalem, and it became an hospital for guests and strangers only, to the exclusion of the sick and maimed. On the dissolution of monasteries, it devolved to the crown, and so continued till applied to its present use by Charles II. The building, completed in 1684, according to a plan of Sir Christopher Wren, is an oblong 306 feet by 288, three sides of which are dwelling-rooms, connected by covered corridors. The fourth contains the chapel, a venerable building, of limited size; the dining hall, in which the banners taken from the Spaniards at Gibraltar are suspended; and the apartments of the master, who is always the commander of the forces for the time being. Connected with the main building are several subordinate offices, a garden, and an avenue bordered by rows of stately trees.

Among the asylums for destitute children, the Foundling Hospital was by much the most extensive. It was opened in 1730 for destitute children of every age, but afterwards limited to the reception of those under a year old. The institution was maintained partly by voluntary contributions, partly by a local tax on Dublin, but chiefly by large parliamentary grants and restraints put on the admission of children. The average number annually admitted for twenty years up to 1825 was 2000. The buildings, with large gardens attached to them, are situated in a healthy and elevated situation in the west of Dublin, and are now converted to the use of the South Dublin Union. The Blue Coat Hospital was originally intended as a place of refuge for all the poor in the city. This object being soon found impracticable, it was reduced to an asylum for aged citizens and their orphan sons, and ultimately confined to this last-named class. The buildings in Oxmantown originally covered a considerable space; and previously to the building of the parliament house in College Green the parliament held its sittings there. The present edifice is built nearly on the site of the former. It consists of an elegant centre, with detached wings, one used as a chapel. Of the 120 boys it receives, 58 are named by the corporation, 50 by the governors of Erasmus Smith's schools, 10 by the Bishop of Meath as trustee to a bequest, and 2 by the incumbent of St Werburghs on a similar title. They are educated in the tenets of the Protestant church, and apprenticed to Protestant masters. The Hibernian School in the Park supports and educates the children of soldiers. A preference is given to those whose fathers have been killed, or died on foreign stations. The buildings, which are spacious, have gardens and exercising ground attached to them; and the boys, in addition to the usual routine of scholastic instruction, are trained to the rudiments of military tactics. On the southern quay, near Ringsend, is the Hibernian Marine School, instituted for sailors' children. It consists of a centre building and two wings, the latter containing the school and chapel. At a proper age the pupils are placed in the royal navy, or apprenticed to merchants, who take them without fee. The number of boys was 180; but it has been contracted in consequence of the reduction of the parliamentary grant.

City.

Besides these there are numerous institutions for the relief of various classes of the distressed or vicious portions of the population. The majority of these may be zealously and well managed; but whether a mass of small institutions, creating some evil, and failing to extend relief to much misery, are of substantial benefit to the public, may reasonably be doubted.

The progress of disease is combated, and the sufferings from accidental injuries assuaged, by means of numerous institutions; one of the most extensive of which is Steevens' Hospital. It was founded by the bequest of a physician whose name it bears, and erected by his sister, who having been left a life interest in the property previously to its being applied to its final purpose, immediately devoted the greater part of it to fulfil her brother's intentions, reserving to herself only L.120 per annum, and apartments in the hospital. In addition to the original estate, and to other contributions and bequests, altogether amounting to L.2200 per annum, it receives a grant of public money. This hospital is capable of accommodating 300 patients, and is provided with distinct wards for diseases of children, diseases of the eye, &c. The City of Dublin Hospital, in Upper Baggot Street, was founded in the year 1832, for the purpose of affording additional hospital relief to the sick poor of the metropolis, and is supported by voluntary contributions. The Meath Hospital, originally built in the Coombe, for the benefit of the liberties of Dublin, and afterwards converted into a county hospital by act of parliament, has been transferred from its former confined and low situation to another in the outlets, where a large building was erected for it, chiefly through the munificence of Mr Thomas Pleasants, who contributed L.6000 towards its building and maintenance. Its annual income exceeds L.1000. The medical officers at first received salaries of L.100 each, which they have resigned for the benefit of the institution. The hospital on the Coombe is now the Coombe Lying-in Hospital. The Charitable Infirmary, in Jervis Street, the oldest in Dublin, and opened at first in Cook Street, A.D. 1721, by the contributions and exertions of a few gentlemen of the medical profession, was transferred to its present situation in 1792. It is capable of accommodating 50 patients, but the state of its funds seldom admits of more than 30. The General Military Hospital at the entrance of the Phœnix Park, standing on an eminence in a healthful situation, is a general infirmary for the army. The edifice, though plain, is much admired for the elegance of its proportions. Sir Patrick Dun's Hospital, opened in 1810, is appropriated exclusively to medical cases, for the instruction of the pupils attending the professors of the College of Physicians. The Richmond Surgical Hospital in North Brunswick Street has attached to it the Talbot General Dispensary, and Mercer's Hospital, founded by a benevolent lady of that name, in Stephen Street, on the site of the decayed hospital of St Stephen, and are set apart for surgical cases and accidents. The House of Recovery in Cork Street, the first and largest of the fever hospitals, is supported by subscriptions, the interest of donations, and a grant of public money; and has contributed to check considerably the progress of low fever prevalent among the ill-fed artizans and paupers in that district. It was opened in 1804, and between that date and October 1852, 165,913 patients had been admitted, of which number 154,035 were discharged cured, 11,764 died, and 114 remained in the house. Its beneficial effects led to the opening of a second in the north of Dublin, on a smaller scale, called the Whitworth Hospital, which is not now a fever hospital, but open for the reception of patients labouring under general medical and surgical complaints. The number of patients admitted annually to the Dublin Hospital averages above 4500; of which

City. number 94 out of every 100 have been discharged cured, a sufficient proof of skilful attendance. The Lock Hospital was opened in Townsend Street in 1792, for the reception of venereal patients of both sexes; but in 1820 male patients were excluded, and it has been ever since confined to females. The number of beds, originally 300, is now reduced to half that number. The building, of plain granite, consists of a centre, containing apartments for the officers, and two wings in which are the patients' wards. It is wholly under the control of a board appointed by the lord lieutenant.

The formation of dispensaries was encouraged by a special act of parliament authorizing grand juries to present in aid of them a sum equal to that subscribed by individuals. There are several dispensaries for particular complaints; but the district dispensaries which are attached to the different poor-law unions throughout Ireland, are placed under the control of the Poor-Law Commissioners by the Medical Charities act of 1851, which supersedes the provisions of former acts.

Most of the religious societies spring from kindred sources in England. The chief among them is the Hibernian Bible Society, founded in 1807. Several minor societies for the distribution of the Bible, and differing from one another chiefly as to the channel into which their labours should be directed, have arisen from it, some detached, others auxiliaries or branches of the parent association. The Irish Society was formed for promoting the religious instruction of the Irish through the medium of their own language, by publishing Bibles, Testaments, tracts, and rudimentary books in that tongue, and by sending itinerant teachers through the country for their instruction. The names of the Church Missionary, the Methodist Missionary Societies, &c., announce the origin and objects of each. The Religious Tract Society has an extensive store and sale-room in Sackville Street. The Continental Society professes generally to promote religious knowledge and sentiments throughout Europe.

Scientific and literary societies are few. The Royal Dublin Society is foremost in seniority and importance. It owes its origin to some literary gentlemen, who in 1731 formed an association for scientific purposes meeting in Trinity College. In 1750 it was incorporated by charter, and received an annual parliamentary grant of L.500, which was gradually augmented until it amounted to L.10,000, but of late years it has been reduced. The improvement of agriculture and rural economy is promoted by annual cattle shows, when prizes exceeding L.300 are awarded. There is also an exhibition of farm and dairy produce in November; and an exhibition of manufactures takes place triennially. The professorships of mining and the veterinary art have been discontinued. A drawing school is established, in which pupils of promising talents are instructed gratuitously in landscape, figure drawing, architecture, and modelling, and premiums are periodically awarded. The society is also provided with a good library, containing upwards of 12,000 volumes. It is particularly rich in works on botany, and in those relating to Ireland. It has likewise a gallery of statuary, in which are casts from the Elgin marbles. The museum and gallery are open to the public on particular days. The members, who are admitted by ballot, on payment of an admission fee of L.30, which covers all subsequent expenses, have the exclusive advantage of the library, and of a reading-room well supplied with newspapers and periodicals. By a late bye-law, annual members are admissible to most of the advantages of the society on payment of a subscription of three guineas. The society held its meetings in Shaw's Court until 1767, when it removed to Grafton Street, and thence in 1796 to a building erected for it in Hawkins Street. In 1815 it purchased the splendid museum and grounds of the Duke of Leinster in Kildare Street, where it still continues. The Kirwanian Society, which takes its name from the celebrated chemist and mineralogist, was formed in 1812 for the advancement of chemistry, mineralogy, and natural history. It is supported wholly by individual subscription. The Zoological Society, formed in 1830, on the model of those in Dublin, has a garden on land granted to it by the lord lieutenant in the Phœnix Park, in which it has already collected a menagerie of living animals, which makes it an object of general attraction to the citizens of Dublin. It is supported by subscriptions, and by the money paid by the public for admission. The Royal Irish Academy was instituted by patent in 1786, to promote the study of polite literature, science, and antiquities. Its formation was chiefly owing to the exertions of its president, the first Earl of Charlemont. It holds its meetings in Dawson Street, where it has a library containing some valuable manuscripts, and occasionally publishes a volume of transactions. This society receives an annual parliamentary grant of L.300. City.

Several attempts have been made to create a taste for the fine arts in Dublin. In 1764 an association of artists erected a neat building in William Street for their meetings, and for the exhibition of their works; but the profits of the scheme did not cover their expenses, and the building was consequently offered for sale, and purchased by the corporation of Dublin as an assembly-house. Exhibitions of pictures by native artists were afterwards opened in Hawkins Street, under the patronage of the Dublin Society. Being discontinued in consequence of the society's removal to Leinster House, which afforded no suitable room for exhibition, the artists attempted their revival in the Royal Arcade in 1821, but without success. These failures were attributable not merely to the indifference of the public, but to dissensions among the artists themselves. The want of a permanent place of exhibition has been supplied by the liberality of Mr Francis Johnston, an architect to whom Dublin is indebted for several of its modern buildings, particularly the new Castle Chapel, and the General Post-Office. He built an elegant and appropriate structure, at an expense of L.10,000, which, when finished, he presented to the Society of Artists. Their exhibitions have been held in it since its opening in 1825. The society was incorporated in 1823, and receives an annual parliamentary grant of L.300.

The principal library in Dublin, for the number and value of its books, is that of Trinity College. It is open of right only to such graduates of that university as take a strict oath relative to their conduct while in it, and to their treatment of its contents. Admission by special favour is attainable, but with some difficulty. It contains about 110,000 printed volumes, and 1500 manuscripts, the number of books being annually increased partly by purchase, and partly in consequence of the right conferred by the Copyright act of receiving a copy of every new publication. The King's Inns Library is next in value. The right of reading in it is confined to the members of the King's Inns Society; that is, to barristers, attorneys, and law students. Marsh's Library, attached to St Patrick's Cathedral by the munificent bequest of Primate Marsh, archbishop of Armagh, and incorporated in 1707, contains a good collection of old books, and is open to the public on liberal terms; but, from the very small portion of its funds appropriated to the purchase of books, it is very deficient in modern publications. It possesses some valuable manuscripts. Steevens' Hospital, the Royal Hospital, Sir Patrick Dun's Hospital, and the College of Surgeons, have each a small library attached to it, chiefly of medical books, for the use of the practitioners. The want of a public library easily accessible, and provided with the works most in request, was attempted to be supplied by a society, which, having been formed in 1791, has collected a large number of books in a handsome and well-arranged building in D'Olier Street. The institution is entitled the Dublin Library Society and Hibernian Athenæum. Attached to it is a fine reading-room, well supplied with newspapers. But as the fund, arising solely from annual subscriptions, is not sufficient to stock the library with new publications, and to furnish a sufficient assortment of newspapers, the former of these demands has been made subordinate to the latter, and the library consequently impoverished.

The increase of commercial transactions occasioned by a long continuance of domestic tranquillity after the revolution of 1688, excited a desire among the merchants to have a suitable place for transacting their public business; and consequently the foundations of the Royal Exchange were in 1769 laid on Cork Hill, and the building was opened ten years after—at an expense of L.40,000, procured by subscriptions, lotteries, and grants of public money. It is one of the most admired structures in Dublin. Its principal front consists of a Corinthian portico of six columns. The interior is chiefly occupied by a magnificent circular hall lighted from above, with which several smaller apartments are connected. The progress of civic improvements gradually threw this fine building out of the more convenient channels of business. A more central position for mercantile transactions presented itself in Dame Street. Thither therefore the sagacity of speculation was directed, and a new building has been raised, principally by L.50 shares,

City.

with more extensive and suitable accommodation, under the name of the Commercial Buildings. The value of the Royal Exchange has consequently diminished. It is now wholly appropriated to the municipal business of the city. It is also a depository for the statues of celebrated characters, and has in it those of George III., Henry Grattan, Doctor Lucas, Daniel O'Connell, and Thomas Drummond. The Commercial Buildings form a small square of simple architecture fronting Dame Street. They contain a large saloon occupied as a news-room, and offices for merchants and brokers, together with an hotel and coffee-house, over which is the Stock Exchange. In order still further to promote the commercial interests of Dublin, an association was formed about thirty years ago, under the name of the Chamber of Commerce, which soon decayed; but the idea was revived in 1820, when a number of merchants formed themselves into a society under the same name, which still exists. Its objects are the protection and promotion of the manufacturing and commercial interests of Dublin, and of the country in general. The business is transacted by a president, vice-presidents, and committee, instructed to communicate with the officers of government on the subjects of the association. Their office is held in the Commercial Buildings. The Ouzel Galley is another voluntary association of merchants, for determining commercial differences by arbitration. It takes its name from that of a vessel, which was the occasion of a complicated and protracted suit, that was ultimately adjusted in an amicable manner by the interference of some of the most respectable merchants in Dublin. The effect of steam navigation on the cross-channel trade has produced a great alteration in the state of commerce in Dublin.

The Bank of Ireland was formed in 1783, in order to give security to commerce. It was opened at first in some old houses in Mary's Abbey, with a capital of L.600,000, which was afterwards increased to L.3,000,000. In the year 1802 the parliament house was purchased by the directors, and adapted to its present destination. This edifice was erected in 1729; and notwithstanding the changes made in it since it was diverted from its original purpose, the exterior has been but little altered. It consists of three fronts. The principal, towards College Green, a colonnade of the Ionic order, formed of a façade and two projecting wings, is much admired for the noble simplicity of its elevation. The western front, a portico of four Ionic columns, was connected with the other by a colonnade of the same order, forming the quadrant of a circle. The eastern front, which was the entrance of the House of Lords, was, by their special order, a colonnade of the Corinthian order, which the architect found great difficulty in uniting with the other parts. The apartment for the lords, a fine room, was hung with tapestry. That of the commons having been burned in 1792 (whether by accident or design has never been fully ascertained), was reconstructed after a more elegant design, in the form of a circle surrounded by pillars, between which was a gallery for hearers. This fine hall was taken down by the bank directors, and converted into a square room, now the cash-office.

The commerce of the Port of Dublin had increased so much towards the close of the last century, that the accommodation afforded in the river for shipping was found insufficient, and the Irish parliament granted L.15,000 for forming docks on both sides of it. The Floating and Graving Docks, communicating with the Grand Canal on the south side, including a basin covering 40 statute acres, with a fine quay and store frontage of 7500 feet, were opened in 1796; and St George's, the latest of the Custom-House Docks, in 1821. These latter cover an area of 8 acres, have 16 feet depth of water, and 1200 yards of quay; they are capable of accommodating 40,000 tons of shipping, and the stores have space for 8000 casks of sugar and tobacco, and 20,000 chests of tea, with cellarage for 12,000 pipes of wine. The docks on the south side afford commodious wharfage for 100 sail of merchantmen and colliers, exclusive of that supplied by the river-quays. The formation of the asylum-harbour at Kingstown, then Dunleary, which was commenced in 1817, gave additional aid to the commerce of the port, by the increased protection it afforded to shipping. The improvements made on the bar, in the erection of the great northern wall or breakwater, and the steam dredging of the bed of the Liffey by the ballast board, by rendering the channel sufficiently deep for the navigation of vessels of 1400 tons, has also contributed greatly to the same effect.

There were in 1852 belonging to the port, including steamers, 454 vessels, of every size, from 15 to 1200 tons; the registered burden amounting to 39,814 tons. Most of those vessels were employed in the coasting or cross-channel trade, there having been but 6 or 8 in that of the West Indies, the same number in that of France and the Spanish Peninsula, and 20 or 30 in the North American timber trade. The amount of customs collected averages about L.950,000, and has not varied much during the last twelve years, the reduction of duties having more than balanced the increase in the quantity of articles imported.

City.

The site of the city of Dublin was long confined to the hill on the south side of the river of which High Street forms the crest, and the castle the eastern declivity. The walls, which may be traced now only on maps, did not exceed a mile in length. From the north tower of the castle they were carried over Cork Hill, near which was an entrance called Dame's Gate, looking towards Hoggins', now Gollege Green. Near Essex Bride was another entrance called Essex Gate, erected on the site of Isod's Tower. The wall was then carried westwards along the course of the river to the end of Fishamble Street. Here stood Fyan's Castle, sometimes used as a state prison. Thence it continued along Wood Quay to Winetavern Street, where was another castle; and, still continuing parallel to the river, it joined a castle through which was one of the principal entrances opposite to Bridge Street. Thence it was carried to New Row, and up the hill to Cutpurse Row, at the end of which was Newgate, also used as a prison. From Corn Market it passed along the rear of Back Lane to Nicholas Gate, thence between Ross Lane and Bride's Alley to Pool Gate, afterwards Werburgh Gate, and thence in a straight line till it joined the castle at Bermingham Tower. The part of the city now called Dame Street and College Green was a low swampy plot, subject to inundations of the river, to the north of which were a Danish settlement, now called Oxmantown, a corruption from Ostmen's Town, and the extensive monastery of St Mary's, with its appendage the friary of St Saviour. The only passage across the river by land was by a bridge at the end of Bridge Street—formerly called Old Bridge, Dublin Bridge, Ormond Bridge, and for some time Friars' Bridge. It was taken down in 1815, and its place supplied by an elegant structure of three arches called Whitworth Bridge. All the monastic buildings, except the Dominican Friary, were on the south side of the river. These were the two cathedrals, the abbey of St Thomas the Martyr, since called Thomas Court; the priory of All Hallows, now Trinity College; the monastery of St Francis, in Francis Street; the monastery of the Holy Trinity, on the site of the late theatre in Crow Street; the Carmelite or Whitefriars' Monastery, lately restored, in Whitefriar Street; and the nunnery of St Mary de Hogges, on the ground where St Andrew's Church now stands. The precise situations of the nunnery of St Mary des Dames, whence Dame Street has its name, of the abbey of St Olave, somewhere in Castle Street, of the monastery of Witeshan in the west of Dublin, and of the priory of Knights Templars in Catgott, in the southern suburbs, are now unknown. The abbots of the Cistercians of St Mary's Abbey, and of the Augustinians of St Thomas the Martyr, were united, and with the priors of the Knights of St John of Jerusalem at Kilmainham, of the Augustinians of the Holy Trinity or Christ Church, and of the Augustinians of All Saints (now Trinity College), sat in the Irish parliament as spiritual peers. The hospital of St Stephen occupied the site of Mercer's Hospital; the Steyne Hospital stood on Lazar's Hill, now Bank Street; and Allen's Hospital lay between St Kevin Street and the bounds of the archbishop's palace in St Sepulchre's. Though the buildings spread themselves from an early period in all directions, the walls were never extended beyond their original limits.

In general it may be observed, that the progress of architectural improvement has taken an eastern direction. Most of the public buildings and new streets lie on that side of the castle, whilst those towards the west are rapidly falling into decay. About the year 1770 a road was carried round the city, so as to connect all the outlets; it was called the Circular Road. The boundary thus formed measures somewhat less than nine miles, and comprises an area within its limits of 1264 acres, intersected by the Liffey, which has 478 acres of the entire area on its northern, and 786 on its southern side. Latterly the lines of the Royal and Grand Canal on the north and south have afforded a boundary line still more comprehensive; but the entire of the included area is not covered with buildings.

A circle, with Essex Bridge as a centre, and with a radius of one mile, will comprehend very nearly all the inhabited part of the city, exclusive of the outlying villages. Both sides of the river are cased by walls of granite, forming spacious quays. These are intersected by nine bridges; Carlisle Bridge, nearest to the sea; Wellington, or the Metal Bridge, a single arch of cast iron, erected in 1816, for foot passengers only; Essex Bridge, of five arches; Richmond Bridge, also of five arches; Whitworth Bridge, formerly Dublin Bridge; Queen's Bridge; King's Bridge; and Sarah Bridge. The two last-named are each of a single arch; the first of them of iron, the other, a building peculiarly elegant in its proportions, of stone. All these bridges are of modern erection, and elegant in construction.

"First impressions of Dublin," says Inglis, "are decidedly favourable. Dublin, for its size, is a handsomer city than London. Sackville Street will compare with any street in Europe; Merrion Square and St Stephen's Green surpass in extent any of the squares in the British metropolis. There are points of view in Dublin, the quays, and some of the finest public edifices, more striking, I think, than any that are to be found in London; and although the Irish capital can boast of no St Paul's, yet, in the architectural beauty of some of her public buildings, she has just reason for pride. I need but name the Custom-House, and the Bank of Ireland with its magnificent yet classically chaste colonnades, in proof of this assertion." There is much truth in this description, yet the chief advantage which Dublin has in picturesque beauty lies in the concentration of the objects of interest within a small compass, and further examination does not confirm the first favourable impression. Sir John Forbes, who visited Ireland in 1852, says—"I own myself to have been a good deal disappointed with Dublin as a city. To say nothing of its extent, it is greatly inferior in many other respects, not only to London, but to several towns in England, and some in Scotland. Its site is flat and monotonous, and its streets and squares possess no architectural beauty. The former, to be sure, are often very wide, and some of the latter, as Merrion Square and Stephen's Green, are of immense extent, but there is throughout a general want of elegance and grandeur. Most of the streets seem to want dignity, and the majority of the houses are common-looking, and even mean and dingy. While denying both beauty and grandeur to Dublin as a city, I must join in the universal judgment as to the splendour of many of its public buildings, as the Bank of Ireland—formerly the Parliament House, the Custom-House, the Post-Office, the Royal Exchange, &c."

Few cities present a more striking picture of the extremes of splendour and destitution than Dublin. A line drawn from the King's Inns in the north of Dublin, directly south, through Capel Street, the castle, and Aungier Street, will, together with the line of the Liffey, divide the whole area into four districts, materially differing from each other in appearance and character. The south-eastern district, which comprehends three of the great squares, and the north-eastern, which includes the two remaining squares, are chiefly inhabited by the nobility, the landed gentry, and the liberal professions. These two districts present many symptoms of affluence and luxury. But on proceeding westward the scene suddenly changes. A considerable portion of the south-western district, which includes the liberties of St Sepulchre's and Thomas Court, and was formerly the seat of the silk and woollen manufactures, and also of the north-western portion of the city, are in a state of almost hopeless decay. The squalid misery visible in the ruinous portions of the city is relieved to the eye by the beauty of the environs of the city; and in its immediate vicinity is the Phœnix Park, of which the citizens are justly proud. It comprises an area of 1753 acres, within which are contained the Viceregal Lodge, the usual residence of the lord lieutenant, with 160 acres of demesne and gardens, the chief and under secretary's lodges, and the lodges of the park rangers and their assistants, with their respective inclosed grounds, the Hibernian school for soldiers' children, the military magazine, the military infirmary, the zoological gardens, the constabulary barracks, &c. Inglis, a good authority on such subjects, pronounced this park as superior, both in extent and diversity of surface, to any public park, promenade, prater, or prado, belonging to any other European city.—(Whitelaw and Walsh's *History of Dublin; Thom's Irish Almanac;* Gilbert's *History of the City of Dublin*, 1854. (H. S—R.)

DUBNO, a town of Russian Poland, capital of a cognominal circle in the government of Volhynia, on the Irwa, 36 miles N. by E. of Brody. The town is very irregular and ill-built, but it has a considerable trade in cattle and timber. Pop. 8000.

DUBOI, a town of Hindustan, province of Gujerat and district of Chumpaneer, standing in a low and marshy situation. Here are the remains of a Hindu city of great antiquity. The fortifications which surround it are nearly three miles in circumference. Duboi is 40 miles N.E. from Broach. The vast quantity of massive hewn stone used in the ancient structures of Duboi is calculated to excite surprise, insomuch as scarcely a pebble is to be met with in this alluvial part of Gujerat. Lat. 22. 8.; Long. 73. 25. (E. T.)

DUBOS, JEAN-BAPTISTE, an eminent French author, was born at Beauvais in December 1670. At first he applied himself to theology, but soon renounced this pursuit for the study of public law, and of the political interests of Europe. M. de Torcy, when minister of foreign affairs, employed Dubos with advantage in several secret negotiations; and both the regent and Cardinal Dubois made the same use of his talents, with the same success. Having retired from the field of politics, he entered upon that of history and literature; and in 1720 his works opened to him the doors of the French Academy, of which, in 1722, he was appointed perpetual secretary in the room of M. Dacier. He died at Paris on the 23d of March 1742, at the age of seventy-two, repeating as he expired the well-known remark of an ancient, "Death is a law, not a punishment." According to Dubos, "there are three things which ought to console us for parting with life; the friends whom we have lost, the few persons worthy of being loved whom we leave behind, and lastly, the recollection of our follies, with the certainty that we shall commit no more." His first work was *L'Histoire des quatre Gordiens, prouvée et illustrée par des Médailles*, Paris, 1695, 12mo. The common opinion, which only admits three emperors of this name, has prevailed in spite of all the efforts of his erudition and criticism. About the commencement of the war of 1701, being charged with different negotiations both in Holland and in England, in order if possible to engage these powers to adopt a pacific line of policy, he, in order to promote the objects of his mission, published a work entitled *Les Intérêts de l'Angleterre mal entendus dans la Guerre présente*, Amsterdam, 1703, 12mo. But as this work contained indiscreet disclosures, of which the enemy took advantage, and predictions which were not fulfilled, a wag took occasion to remark that the title ought to be read thus: *Les Intérêts de l'Angleterre mal entendus par l'Abbé Dubos*. His next work was *L'Histoire de la Ligue de Cambray*, Paris, 1709, 1728, and 1785, 2 vols. 12mo. This history, says Voltaire, is profound, political, interesting; it makes us acquainted with the manners and usages of the time, and is a model of its kind. In 1734 he published his *Histoire Critique de l'établissement de la Monarchie Française dans les Gaules*, 3 vols. 4to; a work the object of which was to prove that the Francs had entered the Gauls, not as conquerors, but at the request of the nation, which, according to him, had called them in to govern it. But this system, though unfolded with a degree of skill and ability which at first procured it many zealous partizans, was victoriously refuted by Montesquieu at the end of the thirtieth book of the *Esprit des Lois*. "C'est un colosse," said Montesquieu, "qui a de pieds d'argile, et c'est parce que les pieds sont d'argile que le colosse est immense. Si le système de M. l'Abbé Dubos avait eu de bons fondemens, il n'aurait pas été obligé de faire trois mortels volumes pour le prouver; il aurait tout trouvé dans son sujet; et sans aller chercher

de toutes parts ce qui en était très loin, la raison elle-même se serait chargée de placer cette vérité dans la chaîne des autres vérités. L'histoire et nos lois lui auraient dit: 'Ne prenez pas tant de peine; nous rendrons témoignage de vous.'" His *Réflexions critiques sur la Poésie et sur la Peinture*, published for the first time in 1719, 2 vols. 12mo, but often reprinted in three volumes, constitute one of the works in which the theory of the arts is explained with the utmost sagacity and discrimination. "All artists," says Voltaire, "read it with advantage. It is the most useful book which has ever been written on the subjects of which it treats, in any nation of Europe. The excellence of the work consists in this, that it contains few errors, and many reflections which are just, novel, and profound. It is not a methodical book; but the author thinks, and makes others think. He was, however, ignorant of music; he had never been able to make verses, and he had not a single picture in his possession; but he had read, seen, heard, and reflected much." Besides the works above enumerated, a manifesto of Maximilian, elector of Bavaria, against Leopold, emperor of Germany, relative to the succession in Spain, has been attributed to Dubos, chiefly, we believe, by reason of the excellence of the style, which has been greatly commended. (J. B—E.)

DUBRIS, the ancient Roman name of Dover. See DOVER.

DUBUQUE, the capital of a cognominal county, state of Iowa, North America; on the W. bank of the Mississippi, 72 miles N.N.E. of the city of Iowa. Pop. 4071. It is the great depôt of the Iowa lead region, and this metal constitutes its chief export.

DUCAS, MICHAEL, a Greek historian who flourished under Constantine XII., and, after the fall of Constantinople, was employed in various diplomatic functions by the princes of Lesbos. He is the author of a history beginning with the death of John Palæologus I., and extending as far as the capture of Lesbos in 1462, which has been edited by Bullialdus (Paris, 1649), and by Bekker (Bonn, 1834). Although barbarous in style, it is both judicious and trustworthy.

DUCAT, a foreign coin, either of gold or silver, struck in the dominions of a duke. The ducat was first coined by Longinus, governor of Italy, who revolted against the emperor Justin the Younger, and made himself duke of Ravenna, calling himself *Exarcha*, that is *without lord or ruler;* and he struck pieces of money of very pure gold with his own stamp, which, as Procopius relates, were called *ducati*, ducats. According to Du Cange, ducats were coined by Roger, king of Sicily, in the year 1240. The Venetian ducat was first struck by John Dandolo in 1280, and inscribed with this legend,—

Sit Tibi, Christe, datus, quem Tu regis iste Ducatus.

DUCATO, CAPE, the modern name of the ancient Leucate, a promontory at the S. end of Santa Maura, one of the Ionian Islands; celebrated as the rock from which Sappho precipitated herself into the sea.

DUCATOON, a silver coin, struck chiefly in Italy, particularly at Milan, Venice, Florence, Genoa, Lucca, Mantua, and Parma; though there are also Dutch and Flemish ducatoons. See MONEY.

DUCENARIUS, in *Antiquity*, the name of various officers and magistrates under the Roman emperors. The principal of these were—the imperial *procuratores*, or intendants, who received a salary of 200 sesterces; *ducenarii judices*, petty judges, chosen from among persons possessed of only 200 sesterces; *ducenarii*, officers who had the command of two centuries; and the *ducenarii* or household troops.

DUCENTESIMA, in *Roman Antiquity*, a tax of the two hundredth part; one-half per cent.

DUCHAL, JAMES, D.D. (1697-1761), an Irish Nonconformist divine, was born at Antrim. He studied at Glasgow, and was minister to a Dissenting congregation at Cambridge, Antrim, and Dublin, successively. He was the author of a series of discourses on the *Presumptive Arguments for the Truth of Christianity*. A selection from his other discourses was published posthumously in 1764.

DUCHY, or DUTCHY, the territory or dominions of a duke.

DUCHY *Court*, the court of the duchy or county palatine of Lancaster in England.

DUCK. See ORNITHOLOGY.

DUCKING-STOOL, a chair or seat in which scolding women in former times were tied and plunged into water.

DUCLOS, CHARLES PINEAU, a French author of some celebrity, was born at Dinant, in Bretagne, in 1704. At an early age he was sent to study at Paris. The imprudence of youth, and his love of pleasure, led him at first to contract certain intimacies which were little suited to his circumstances; but having afterwards disengaged himself from these, he courted the society of all the wits of his time, by whom he was well received. He became a member of that club, or association of young men, who published their juvenile productions under the titles of *Récueil de ces Messieurs*, *Etrennes de la St Jean*, *Œufs de Paques*, &c. The romance of *Acajou and Zirphile*, which was composed after a series of plates which had been engraved for another work, was one of the fruits of this association, and was produced in consequence of a sort of wager amongst its members. The epistolary dedication to the public, which was prefixed to this trifle, gave umbrage to some, in consequence of the flippant tone which the author assumed. Duclos had previously written two other romances, which were more favourably received: *The Baroness de Luz*, and the *Confessions of the Count de* ***. His first serious publication was the *History of Louis XI.* The style of this work is dry and epigrammatical, but the author has displayed in it considerable powers of research, and preserved the character of an impartial historian. The reputation of Duclos as an author was confirmed by the publication of his *Considérations sur les Mœurs*, a work which is much praised by Laharpe, and not without justice; for although the style, as in most of the writings of this author, is rather stiff and sententious, the book undoubtedly contains a great deal of just and ingenious reflection. It was translated both into English and German. The *Mémoires pour servir à l'Histoire du dix-huitième Siècle*, which were intended by the author as a sort of sequel to the preceding work, are nevertheless much inferior both in respect of style and matter, and are, in reality, little better than a kind of romance. In consequence of his *History of Louis XI.* he was appointed historiographer of France, when that place became vacant on Voltaire's retirement to Prussia. His *Secret Memoirs of the Reign of Louis XIV. and Louis XV.*, and his *Considerations on Italy*, were not published until after the Revolution. The former work is highly spoken of by Chamfort.

Duclos became a member of the Academy of Inscriptions in 1739, and of the French Academy in 1747. Of the latter he was appointed perpetual secretary in 1755. Both of these academies were indebted to him not only for many valuable contributions, but likewise for several useful regulations and improvements. As a member of the Academy of Inscriptions, he composed several memoirs on the Druids; on the origin and revolutions of the Celtic and French languages; on trial by battle, and proof by ordeal; and on scenic representations and the ancient drama. As a member of the French Academy, he assisted in compiling the new edition of the *Dictionary*, which was published in 1762; and he made some just and philosophical remarks on the *Port Royal Grammar*. On several occasions he resolutely supported the honour and prerogatives of the societies to which he belonged, and maintained the respectability of the literary character in general. He used to say of him-

self, "I shall leave behind me a name dear to literary men." His fellow-citizens, whose interests he always supported with zeal, appointed him mayor of their town in 1744, although he was resident at Paris. He was afterwards elected deputy from the commons to the assembly of the states of Bretagne; and upon the requisition of this body the king granted him letters of nobility.

In 1766 he was advised to retire from France for some time, in order that the government might have an opportunity of forgetting some opinions which he had hazarded on the subject of the dispute between the Duc d'Aiguillon and M. de la Chalotais, the friend and countryman of Duclos. Accordingly he set out for Italy; and on his return he wrote an account of his travels, which is also praised by Chamfort. He died at Paris, March 26, 1772, in the sixty-ninth year of his age.

The character of Duclos, although it exhibited many singular traits, was still respectable, whether we consider him as a man or as an author. Rousseau described him very laconically as a man *droit et adroit.* In his manners he displayed a sort of bluntness in society, which frequently rendered him disagreeable; and his caustic wit on many occasions created enemies. To those who knew him, however, he was a pleasant companion. A considerable number of his *bon mots* have been preserved by his biographers. A complete edition of the works of Duclos was published by Desessarts, at Paris, in 10 vols. 8vo, 1806.

DUCT, any tube or canal by which a fluid is conducted or conveyed. It is particularly used to denote the vessels which convey the fluids in animal bodies; and likewise those which convey the sap in plants.

DUCTILITY (Lat. *ductilis*), in *Physics*, that property of certain solid bodies which consists in their yielding to percussion or pressure, or admitting of extension by drawing, without an actual fraction or separation of the parts of their mass. Some bodies are ductile both when they are hot and when they are cold; as metals. Others are ductile only when heated to a sufficient degree; as wax and glass. Other bodies, again, particularly some kinds of iron called by the workmen *red short*, brass, and some other metallic mixtures, are ductile only when cold, and brittle when hot. Certain bodies are made ductile by the absorption of a fluid; as clay. It is on the property of ductility in metals that wire-drawing depends. The following is nearly the order of ductility of the metals which possess this property in the highest degree—commencing with the most ductile:—gold, silver, platinum, iron, copper, zinc, tin, lead, nickel, palladium, cadmium. The malleability of gold (which, like that of other metals, depends on its ductility) is such, that five grains may be made to cover about 270 square inches—the thickness of the leaf not exceeding 1-200,000th part of an inch. Dr Wollaston succeeded in obtaining a platinum wire of which the diameter was only 1-30,000th of an inch.

DUDLEY, Edmund (1462-1510), a celebrated lawyer and statesman in the reign of Henry VII., who with Sir Richard Empson, another lawyer of the same stamp, assisted in filling that rapacious monarch's coffers by arbitrary prosecutions of the people on old penal statutes. On the accession of Henry VIII., Dudley and Empson were attainted of high treason, and beheaded, Aug. 18, partly in order to pacify the clamours of the people for justice.

Dudley, *John* (1502-1553), Duke of Northumberland, son of the above, a statesman memorable in English history for the part he took in placing the crown on the head of his daughter-in-law, Lady Jane Grey. Ambrose (1530-1589), his eldest son, was a brave general and able statesman under Queen Elizabeth, and received the appellation of "the good Earl of Warwick." Henry, the duke's second son, was killed at the siege of St Quentin. Robert, the third son, a man of bad character, was created Earl of Leicester, and became one of Queen Elizabeth's favourites. His fourth son was the unfortunate Lord Guildford Dudley, the husband of Lady Jane Grey. See England.

Dudley, *Sir Robert*, as he was called in England, and, as he was styled abroad, *Earl of Warwick and Duke of Northumberland*, was the son of Robert above mentioned, by the Lady Douglas Sheffield, and was born at Sheen, Surrey, in 1573. On his father's death, in 1588, he succeeded to the greater part of the patrimonial estate; and being fond of navigation, he fitted out a small squadron at his own expense, with which he sailed to the river Orinoco, and took and destroyed nine sail of Spanish ships. In 1595 he attended the Earl of Essex and the lord high admiral of England in their expedition against the Spaniards; and for his gallant behaviour at the taking of Cadiz he received the honour of knighthood. He now endeavoured to prove the legitimacy of his birth, in order to be entitled to his hereditary honours. But being overpowered by the interest of the Countess Dowager of Leicester, he retired to the court of Florence, where he was well received; and on his refusal to return to England his whole estate was seized by King James I. and vested in the crown. At the court of Cosmo II. grand duke of Tuscany, he acquired considerable influence, and enjoyed distinguished honours. For improvements in shipping and manufactures which he projected, as well as for other services, the Emperor Ferdinand, in 1620, created him a duke of the holy Roman empire. He afterwards drained a vast tract of morass between Pisa and the sea, and raised Leghorn, which was then a mean and insignificant place, into a large and beautiful town, improving the haven, and by his influence drawing many English merchants to settle there. He was also a zealous patron of literature, and held a place in the republic of letters. His most celebrated work is his *Del Arcano del Mare*, Firenze, 1630, 1646, folio. This work, which has always been scarce, has now become extremely rare. There is a copy in the British Museum, dated 1661, called the second edition; but that which we have seen belongs to the Society of Writers to the Signet, Edinburgh. The work, which consists of a collection of tracts, comprehends a great number of projects for the improvement of navigation and commerce, with the charts and plans relating to the subject; all of them schemes which, considering the time when they were devised, are quite remarkable for the boldness and originality with which they are conceived, and the extent of scientific acquirements which they exhibit. Sir Robert Dudley died at his castle of Carbello, near Florence, in 1639.

Dudley, a parliamentary borough and market-town of Worcestershire (in a detached portion of it, surrounded by the county of Stafford), 8 miles W.N.W. of Birmingham. Pop. (1851) 37,962. Registered electors (1851-52), 912, returning one member to parliament. The town of Dudley is generally well-built, the houses are neat, and the streets clean and well paved. The parish church of St Thomas is a handsome modern Gothic structure, with a lofty spire. The other churches are St Edmund's, St James's, St John's, and St Andrew's; and there are also various dissenting places of worship. The free grammar-school, founded by Queen Elizabeth, has endowments of upwards of L.300 a-year, and educates about 40 scholars; besides which there are several well-endowed charity and other schools. It has also a mechanic's institute, savings-bank, subscription library, dispensary, and various charitable institutions. Dudley is a principal seat of the iron trade, the vicinity furnishing abundant supplies of coal and iron-ore. The principal manufacture is iron-ware, including chain-cables, grates, fire-irons, and iron utensils generally; but nails constitute its staple production. It has also extensive glass-works. The numerous forges and furnaces in Dudley and the vicinity illuminate the sky by night in a remark-

able manner. The limestone quarries around Dudley are very extensive, the excavations being carried more than a mile and a half under the hill on which the castle stands. The stratification of this district is highly interesting to the geologist, and the organic remains are very numerous. On a hill to the north are the remains of an ancient castle, founded about A.D. 700 by a Saxon prince named Dudo, from whom the town is supposed to have taken its name. Near the castle are some remains of an ancient priory. In the vicinity of Dudley there are some chalybeate springs. Market-day, Saturday.

DUEL, a combat between two persons. To distinguish it from the unpremeditated combat or rencontre, it must take place at a time and place appointed in consequence of a cartel or challenge, and generally in presence of two or more witnesses or umpires.

The word is derived from *duellum*, an antiquated form of the Latin word *bellum;* and, as a judicial trial, it has been defined "singularis pugnus inter duos ad probandam litem, et qui vicit probâsse intelligitur."—(*Fleta.*)

The origin of duelling may be traced to that barbarous state of society in which personal courage was followed as the ruling principle, and esteemed as the noblest ornament of life. Under the influence of such principles, the considerations of justice and humanity were little regarded; and patience under injuries being branded as infamous and cowardly, men were naturally impelled, not only to avenge their own wrongs, but to gratify their private resentments, at the point of the sword.

Before the dawn of Christianity had thrown its light upon the interesting doctrine of a providence superintending the affairs of men, the belief of an adequate distribution of rewards and punishments in the present life seems to have been generally received. The rich, the prosperous, and the happy, were apt to be considered as the peculiar favourites of Heaven; whilst disease, misfortune, and sudden or violent death, were regarded as the inflictions of divine vengeance for the crimes of the sufferers. Hence, in a superstitious age, arose the practice of making a direct appeal to the Deity in the single combat, under the persuasion that the justice of Heaven would infallibly declare for the innocent, and visit the perjured and the guilty with dishonour and death.

The duel, as a judicial trial, prevailed at an early period amongst the Germans, Danes, and Franks; and by a law instituted in 501, by Gundebald, king of the Burgundians, it was allowed in legal proceedings in lieu of swearing.

Louis le Debonnaire was the first French monarch who permitted to litigants the trial by arms; and the same mode of trial was introduced into England, with other Norman customs, by William the Conqueror. It was only used, however, in three cases: in the court martial or court of chivalry, in appeals of felony, and in civil cases upon issue joined in a writ of right; in which last it was the only decision, until Henry II., with consent of parliament, introduced the grand assize. None were exempt from the trial by battle but females, the sick and the maimed, and persons under fifteen or above sixty years of age; ecclesiastics, priests, and monks, being allowed to produce champions in their stead.

The trial by battle, however, soon degenerated into a convenient pretext for gratifying private revenge under sanction of the law, or on pretence of discovering truth and punishing perjury. Under the feudal system it was of course warmly patronized, being but too congenial with the feelings and habits of the fierce and haughty barons, who, uncontrolled by any principles of law or religion, disdained to submit their differences to any arbitration, or to seek any reparation for an injury but by the sword. Arms were the sport, plunder and revenge the business, of their lives. And to such a height did the evils arising from their private quarrels and petty warfare increase, that it became necessary to adopt some means for controlling and directing the torrent of military violence which threatened to sweep away every feeling of justice and humanity, and subject the peace and comfort of the community to the unrestrained passions of a fierce and lawless aristocracy. Martial societies were accordingly instituted, whose duty it was to protect the weak and defenceless, to relieve the oppressed, to correct abuses, and to promote the public good.

Hence arose chivalry and knight-errantry, which, although they modified in some degree the evil of duelling, by imposing a minute and punctilious system of observances, had yet a tendency to perpetuate the practice, by instituting false and fantastic principles of honour. With the code of punctilious regulations, the grounds and motives of the duel were changed and extended. Malice and revenge gave place to the gratification of personal vanity, and the desire of that renown for deeds of arms which was considered as the glory of the age. Tilts and tournaments were the pastime of the nobles, and were not only countenanced by the presence of the prince, who not unfrequently shared the dangers of the field, but graced by the attendance of female beauty and distinction, from whose hands the successful champion received the prize of his achievements, and at whose feet he longed to lay the trophies of his victory. See Chivalry.

The tournament continued in high estimation, notwithstanding the many valuable lives sacrificed on the most frivolous occasions, until the middle of the sixteenth century, when the death of Henry II. of France, in a tournament given in honour of his sister's marriage, gave a check to these sanguinary amusements. At this entertainment Henry sent his lance to Count Montgomerie, the captain of his guards, who at first declined the challenge; but on the king repeating his commands, he was compelled to obey. At the encounter, Montgomerie purposely broke his lance against the king's breastplate; but unhappily for the monarch he wore his helmet open, and a splinter of the lance flew up into his eye, and pierced his brain. He survived for about a month in great agony, and died on the 10th July 1559. (Cockburn *on Duels.*)

In no country has the duel on private and personal quarrels prevailed to so great an extent as in France. Francis I. encouraged the practice by his well-known determination "that the lie was never to be borne without satisfaction but by a base-born fellow." By his challenge to the Emperor Charles V. he set an example which his fierce and haughty nobles were but too eager to follow; and under the countenance of their monarch their native propensity to the single combat was indulged to an extent which all the power of his successors was scarcely able to control.

The power of the church was frequently exerted to restrain these bloody proceedings, especially by a council at Valentia in 855, and lastly by the council of Trent, session xxv. chap. 19, which excommunicated not only the combatants, but their associates, and even the spectators of the battle; declaring the custom to be detestable, introduced by Satan for the destruction both of body and soul. It adds, that "all advisers, supporters, witnesses, or those in any way concerned, are likewise excommunicated. Princes also who connive at duels are to be deprived of all temporal power, jurisdiction, and dominion over the places where they have permitted duels to be fought."

Philip the Fair, at the close of the thirteenth century, forbade all gages or pledges of battle; but this prohibition was afterwards relaxed in several instances; and in 1306 a royal ordonnance was published, prescribing rules, conditions, and ceremonies for the combat.

In the reign of Henry II. a noted duel was fought in the king's presence between Guy Chabot de Jarnac and Francis de la Chastaignerie, in which the latter was slain; and on

this occasion Henry is said to have taken an oath never to allow another during his reign. An edict was published accordingly; but this, which appears to have been the first royal prohibition of the duel, was productive of no good effects. The prohibition indeed arose rather from the king's grief for the loss of his friend Chastaignerie than from any desire on public grounds to abolish the custom; and it appears rather to have aggravated the evil, by increasing the number of private duels: for the same punctilious notions of honour from which the duel generally originated, and the same dread of the imputation of cowardice which kept it alive, were still entertained; and as the royal permission, without which the duel had formerly been high treason, could not now be obtained, each man became the judge in his own cause; and in those delicate cases, of which the law could take no cognizance, the point of honour was more likely to be stretched than curtailed.

The parliament of Paris in 1599 declared all persons who had assisted or been present at the prosecution of these unlawful quarrels to be rebels to the king, transgressors of the laws, and disturbers of the public peace.

Henri IV., during the first eighteen years of whose reign no less than 4000 gentlemen are said to have perished by the duel, alludes in his edict at Blois, 1602, to the disorders arising from this barbarous custom; and in 1609 he added to the penalties already imposed, punishment by death, confiscation of goods, fines, imprisonment, and degradation from honour, on all who were in any way concerned in these combats, not only principals and seconds, or bearers of challenges, but spectators, and even those who, being accidentally present, did not interfere to prevent bloodshed. The severity of these edicts might have contributed greatly to diminish the evil; but unfortunately they arose rather from the complaints of the people, and the persuasions of the Duke of Sully, than from any desire on the part of Henri himself to abolish a custom for which he privately entertained a great partiality, as was evident from the readiness with which he granted pardons to offenders, and even privately encouraged particular duels. He readily gave permission to Crequi to fight Don Philip of Savoy, and even added this encouraging compliment, "If I were not a king I would gladly offer myself to be your second."

It was not to be expected that laws, however severe, the open violation of which was thus countenanced by the monarch himself, could be productive of any beneficial effects; and we find the passion for the single combat continuing unabated during the reign of the succeeding monarch Louis XIII. To such extent indeed did it prevail, that the common inquiry when acquaintances met was not, "what is the news to-day," but "who fought yesterday;" and Lord Herbert, who was ambassador at the court of Louis, says, that "there is scarce a Frenchman worth looking on who has not killed his man in a duel."

Two noblemen, however, Montmorenci Count de Boutteville, the most renowned duellist of the day, and the Marquis de Beuoron, persisting to fight in defiance of the royal interdict, were tried according to law, and both beheaded. This execution caused for a time a cessation of the sanguinary custom; but it was reserved for Louis XIV. to give the first effectual check to the continuance of the practice.

During the minority of this prince a very desperate battle was fought between the Dukes de Beaufort and de Nemours, each attended by four friends. The seconds of the Duke de Nemours were the Marquis de Villars, the Chevalier de la Chaise, D'Uzerches, and Compan; and the Duke de Beaufort was attended by D'Henricourt, De Ris, Buri, and Brillet. They fought five against five, with swords and pistols. Nemours was shot by Beaufort, the Marquis de Villars killed D'Henricourt, and D'Uzerches slew De Ris: the rest were only slightly wounded.

This, with another desperate encounter fought in 1663, four against four, determined the king on taking some decided step to prevent the recurrence of such disgraceful and bloody quarrels. The famous edict published in 1679, with the solemn agreement entered into by the principal nobility, "that they would never fight a duel on any pretence whatever," and the firmness of Louis in refusing pardon to all offenders, contributed more to restrain this unhappy propensity than all the efforts of his predecessors.

The practice of duelling in England, although it never prevailed to such an extent as in France, may be traced to the same causes which gave rise to it on the Continent. The duel, as we have already mentioned, was early in use amongst the Franks and Normans, and was probably by them introduced into England.

One of the latest instances of the trial by battle occurred in the reign of Elizabeth in the year 1571, of which Sir Henry Spelman, who was eye-witness, gives an account of the whole proceedings, which were conducted, he says, "non sine magna jurisconsultorum perturbatione." A proceeding having been instituted in the court of common pleas, for recovery of some manorial rights in the Isle of Hartic, Kent, the defendant offered to maintain his right to possession by the duel. The petitioners accepted the challenge; and as the court does not appear to have had the power of refusal, champions were appointed, and all the requisite forms adjusted. The queen, to prevent bloodshed, had commanded the parties to compromise; but, anxious at once to save the credit of the defendant, who demanded the combat, and to support the authority of the law, which enjoined its being fulfilled, the ceremony of the duel was allowed to proceed. On the appointed day the justices of the common pleas and the counsellors appeared at Tothill Fields as umpires of the combat; but as the petitioners did not appear to acknowledge their champion, they were nonsuited, and victory declared for the defendant. Thus ended the last judicial combat we read of in a civil case. Another, however, occurred in the court of chivalry in 1631, and one in the county palatine of Durham in 1638; and the trial by battle was claimed so late as 1818, in the case of Ashford *v.* Thornton, in an appeal of murder.

But although the duel was disused in judicial proceedings, the fantastic notions of honour to which it gave rise still prevailed; and as the law could take no cognizance of points of honour and personal affronts, private duelling rather increased in the reigns of Elizabeth and James I.

During the civil wars the minds of men were too much occupied with the agitating events of the time to pay much attention to the settlement of points of etiquette, and private feuds for the time were forgotten. The custom, however, again gained ground after the restoration of Charles II.; and although he did issue a proclamation to put the existing laws in force, this object was defeated by his great laxity in pardoning offenders.

In consequence of a duel between the Duke of Hamilton and Lord Mohun in 1712, which was fought with the greatest ferocity and apparent determination of murder, and in which both parties were killed, the subject again came under the consideration of government. At the meeting of parliament in the following year, the queen's speech alluded to the subject in this sentence: "the practice of duelling requires some speedy and effectual remedy." No precise notice was taken of this part of the speech in the address from the House of Commons; and a bill which was brought in for the more effectual restraint of the duel was thrown out on a second reading.

When the fashion of wearing the sword was abandoned, private duels became less frequent in this country, and we have no longer to deplore the numerous and often fatal rencontres which, during the last century, were so frequently begun and concluded in the moment and heat of passion, and not seldom on the most frivolous occasions. Such was

the duel between Lord Byron and Mr Chaworth in 1765, which originated in a dispute during dinner about the quantity of game on their respective manors. The parties retired to an adjoining room, where they fought by the uncertain light of one small tallow candle, and Mr Chaworth, although the more expert swordsman, was mortally wounded.

By the laws of this country all the parties concerned in a duel which terminates fatally are guilty of murder, however fairly the combat may have been conducted, and however great the provocation.

The suddenness of the provocation, and the agitation of excited feelings, which in other cases may be pleaded in extenuation of the crime, cannot be urged in favour of those who, after ample time for deliberation, meet for the avowed purpose of murder.

The duel between Major Campbell and Captain Boyd, for which the former was executed in 1808, is well known, and was considered as little better than deliberate assassination. But in the case of Lieutenant Blundell, who was killed in a duel at Carisbrooke Castle, in the Isle of Wight, in 1813, everything appears to have been conducted with perfect fairness; yet the surviving principal, the seconds, and two others who were considered accessary, were convicted of murder at the Hampshire assizes, and sentenced to death; and although the royal pardon was obtained, they were all dismissed from His Majesty's service.

It is not one of the least evils of this system, that the word *honour*, which, rightly understood, denotes all that is truly noble and virtuous, should be prostituted as a pretext for gratifying the most malignant of human passions, or as a cover for that moral cowardice—the fear of being thought afraid.

With a view to repress this absurd practice in the army, three new articles of war were issued in the year 1844. The first of these, as embodying the chief points, is here given:—

"Every officer who shall give or send a challenge, or who shall accept any challenge to fight a duel with another officer, or who, being privy to an intention to fight a duel, shall not take active measures to prevent such duel, or who shall upbraid another for refusing, or for not giving a challenge, or who shall reject, or advise the rejection, of a reasonable proposition made for the honourable adjustment of a difference—shall be liable, if convicted before a general court-martial, to be cashiered, or suffer such other punishment as the court may award."

The most salutary effect has resulted from these regulations, and it is to be hoped that the absurd practice of duelling will no more disgrace the service.

DUGDALE, Sir William, an eminent English antiquary and historian, was born at Shustoke, near Coleshill, in Warwickshire, in 1605. He was introduced into the herald's office by Sir Christopher Hatton, and ascended gradually through all the degrees, until he became garter principal king at arms. His chief work is the *Monasticon Anglicanum*, in 3 vols. folio, containing the charters and descriptions of all the English monasteries, adorned with engravings; a work in which he was assisted by Mr Roger Dodsworth. Nor are his antiquities of Warwickshire less esteemed. He wrote likewise, the *History of St Paul's Cathedral*, London, 1658, folio; a *History of Embanking and Draining*, London, 1662, 1675, 1676, folio; a *Baronage of England*; and he completed the second volume of Sir Henry's Spelman's Councils, with a second part of his Glossary. He died on the 10th February 1686, in the eighty-first year of his age. His son, Sir John, was norroy king-at-arms, and published a Catalogue of the English nobility. His daughter Elizabeth was married to Elias Ashmole.

DUGONG. See index to Mammalia.

DUHALDE, Jean Baptiste, was born at Paris, Feb. 1, 1674; and having entered into the society of Jesus, he was at length appointed to succeed Father Legobien, who had been intrusted with the duty of collecting and arranging the letters which they received from different quarters of the globe. He was also for some time secretary to the famous Father Letellier, confessor to the king of France. Towards the close of his life he was attacked with acute spasms, which he endured with exemplary resignation, and died Aug. 18, 1743. Duhalde is represented as a man of mild and amiable character, and as remarkable alike for his unaffected piety and unwearied industry. He was the author of some Latin poems, which do not evince any superior degree of excellence; but the productions for which he is principally distinguished are, 1. *Lettres Edifiantes et Curieuses écrites des Missions Etrangères*, which he edited with great ability from the ninth to the twenty-sixth volume inclusively, and which have been translated into English and German; 2. *Description Géographique, Historique, Chronologique, Politique, et Physique, de l'Empire de la Chine et de la Tartarie Chinoise*, Paris, 1735, in four volumes large folio, with figures and an atlas by D'Anville. This work, the first in which China is described with so much exactness and detail, is at the same time a beautiful monument of French typography. The description contained in this work and in the *Lettres Edifiantes* has contributed materially to advance the science of geography. (J. B—E.)

DUHAMEL, de Vrigny le Monceau, Henri Louis, author of many valuable works on agriculture, natural history, and the arts, son of Alexandre Duhamel, lord of Denainvilliers, and of Anne Trottier, was born at Paris in 1700. His family had formerly emigrated to Holland, but returned to France as early as the year 1400, with the Duke of Burgundy.

He was educated at the College d'Harcourt; but the chief advantage which he derived from his residence there, was the taste for the further acquirement of physical knowledge, which he afterwards pursued with ardour at the Jardin du Roi, having for his fellow-students a number of young men, who afterwards acquired a high degree of celebrity, and among the rest Dufay, Geoffroi, Léméri, Jussieu, and Vaillant. At the age of twenty-eight he obtained the title of adjunct botanist in the Academy of Sciences; in 1730 he became an associate, and in 1738 an academician, having previously been elected a fellow of the Royal Society of London, in the beginning of 1734. Upon his first admission into the list of the academy, his assistance was requested in the investigation of a disease which affected the saffron cultivated in the Gâtinois, where his estate was situated; and he found reason to attribute it to a parasitical fungus attached to the roots of the plant. His memoirs and notes communicated to the academy, as well as his separate publications, are so multitudinous, that the shortest possible enumeration of their subjects can barely be brought within the ordinary limits of a biographical article.

1. *A Disease of Plants*, Acad. Paris, 1728. 2. *The Multiplication of Fruits*, 1728. 3. *The Growth of Plants*, 1729. 4. *Grafting*, 1730. 5. *The Pear Tree*, 1730-1-2. 6. *Soluble Tartar*, 1732-3. 7. *Ether*, 1734. 8. *Salt of Sulphur*, 1734. 9. *Sal Ammoniac*, 3 parts, 1735. 10. *The Purple Dye*, 1736. 11. *The Base of Sea Salt*, 1736. 12. *The Strata of Wood*, 1737. 13. *Frosts*, 1737. 14. *Bones Tinged Red*, 1739. 15. *Polygala as a Pectoral*, 1739. 16. *The Misletoe*, 1740. 17. *Botanico-meteorological Observations*, continued annually for forty-two years, 1740–1781. 18. *The Union of Fractured Bones*, 2 parts, 1741. 19. *The Strength of Timber*, 1742. 20. *The Growth of Bones*, 5 parts, 1742-3. 21. *Frobenius's Ether*, 1742. 22. *Anatomy*, 1743. 23. *Slips, Layers, and Offsets*, 1744. 24. *Moisture in Oak Timber*, 1744. 25. *A Magnetic Ore*, 1745. 26. *The Preservation of Seed*, 1745. 27. *Magnetising a Bar*, 1745. 28. *Cordage*, 1746. 29. *The Wounds of Trees*, 1746. 30. *Lime*, 1747. 31. *Calcination of a Stone*, 1748. 32. *Ventilation*, 1748. 33. *Plants raised in Water*, 1748. 34. *Gunpowder*, 1750. 35. *The Weight of Ignited Metals*, 1750. 36. *Tull's Agriculture*, 1750. 37. *The Compass*, 1750. 38. *The Strata of Trees*, 1751. 39. *The Growth of Horns*, 1751. 40. *Bees*, 1754. 41. *Madder*, 1757. 42. *Spontaneous Combustions*, 1757. 43. *Ergot*, 1759. 44. *An Insect Devouring Corn*, 1761; and separ-

The earlier part of Duhamel's life was chiefly devoted to the study of vegetable physiology, which he had continued for thirty years before the publication of his principal works. The most original of his observations related to the growth of plants, the formation of the bark and the wood, the effects of grafting, the inversion of a tree, the double motion of the sap, and the influence of light, air, and soil. In agriculture he introduced the practice of drying corn in a particular stove or kiln, with a heat sufficient to destroy the insects which infested it and their larvas. He made many experiments on manures; and he conferred a great benefit on several provinces of France, by introducing the cultivation of potatoes into general practice, as well as by promoting that of rhubarb in different places.

Having obtained from M. Maurepas the appointment of inspector-general of the marine, he undertook to make himself master of every department of nautical knowledge; and setting out with the established doctrines of Euler and Bouguer, where theory was wanted, he collected for his works on these subjects an immense mass of facts and experiments, affording the means of resolving every question on practical grounds. He established a school for shipbuilders, which effectually secured to them an education superior to that of simple carpenters. He also made some very valuable improvements in the theory of rope-making, showing especially the disadvantages arising from the excessive twisting of cordage. His conduct in this capacity seems to have been as judicious in a moral as in a mechanical point of view; whilst by his modesty and good nature he silenced the contending passions of those with whom he was obliged to enter into discussion, and was enabled to unite a variety of opposite interests, in the important object of the establishment of an academy for the cultivation of naval science.

His meteorological observations included, besides the usual registers, accounts of the direction of the magnetic needle, of the state of agriculture, of the diseases of the year, and of the times of migration of birds, and of the appearance of their young.

From his experiments on the growth of their bones, he inferred that they are enlarged by means of the ossification of the laminæ of the periosteum, nearly in the same manner as trees are known to grow by the hardening of the cortical layers; although the bones, while they are soft, expand in every direction, as the very young shoots of vegetables are also found to do. Having learned from Sir Hans Sloane that madder possesses the property of giving colour to the bones, he fed animals successively on food mixed and not mixed with madder; and he found that their bones in general exhibited concentric strata of red and white, whilst the softer parts showed in the mean time signs of having been progressively extended. These experiments are still of great importance in illustrating the physiology of ossification, although the actual conversion of the periosteum into bone may justly be disputed.

In trees Duhamel found that the graft was incorporated with the stock so as to form a single substance completely identical with it; and he showed that animal bodies were capable of a similar union, the vessels of the animals forming communications with those of the parts inserted; the spur of a cock, for instance, grafted into his comb, uniting perfectly with it, and becoming gradually furnished with a bony core, like the horn of a bullock, which either forms a joint with the cranium, or is firmly attached to it, and affords nourishment for the growth of this newly adopted member.

Having demonstrated in 1737 the different natures of soda and potass, he made an interesting experiment on the production of these alkalies by different vegetables. He sowed the head of the salsola kali at Denainvilliers, and it was found by the analysis of Cadet that its ashes produced at first soda, but afterwards more and more potass every year; and after several generations almost entirely potass. His other chemical memoirs were of less permanent importance; and with respect to the weight of ignited iron, he was unfortunately inaccurate in his mode of conducting the experiment, otherwise it must necessarily have led him to an anticipation of some of the most important discoveries of the last century.

From his extensive correspondence in different countries, he was enabled to communicate to the academy from time to time a number of detached facts, which were both amusing and instructive, and which appear perpetually in the histories of the respective years. His works were in general of an elementary nature, and calculated for the use of such as possessed but little previous information; and hence they may appear to some readers to contain an unnecessary detail of explanation. "Prolixity," says Condorcet, "is injurious to perspicuity, when we are addressing ourselves to persons accustomed to fix their attention firmly on the subject before them, who are able to observe the slightest shades of difference, and to receive at once a variety of ideas; supplying, where there is occasion, any connecting links of the chain which may have been omitted. If we are too diffuse, the attention of such persons droops for want of excitement; their memory is fatigued with the attempt to retain impressions which have not been communicated to them with sufficient force; and when they are compelled to travel slowly, the delay exhausts them, from having been in the constant habit of a more rapid motion. But it was not for this very limited class of readers that Duhamel's works were calculated. He wrote for the use of those who seldom go beyond the bare expressions of the author, who find all close attention toilsome, and who read rather for simple information than for the cultivation of the mind; and an author may always be said to write well when his style is appropriate to his subject, and to the capacity of his readers."

Duhamel was economical in his habits of life, and disinterested in his views, sacrificing his own pecuniary advantage, and that of his family, to the desire of serving the public by his experiments and his writings. Having once established a certain scale for his expenses, he never troubled himself with keeping a minute account of them. His integrity sometimes wore the appearance of severity, and

his vivacity that of harshness; but no imputation was ever cast on the goodness of his heart. He was averse to all changes, both in political and scientific institutions, which were not connected with obvious improvement. He was punctual in his attention to the duties which his religion imposed on him, but he did not sacrifice to unnecessary parade such of his hours as he thought might be more conscientiously employed in studies of general utility. His application, though assiduous, was seldom severely laborious. He never entered into any matrimonial engagements. On some occasions he felt himself neglected by the public; but he was little disposed to lament this injustice, except from reflecting on the effect which it would have had on an individual less zealous or less independent than himself. Besides his election as a fellow of the Royal Society of London, he obtained the honour of diplomas from the academies of St Petersburg, Palermo, Bologna, Edinburgh, and Padua, and from several agricultural societies; and his name has acquired a celebrity commensurate with the extent of his varied researches.

Few persons have ever passed through life with greater tranquillity of mind, or with a greater desire of rendering themselves useful to mankind, than Duhamel. He was one of the most active promoters of the kind of revolution which took place in the cultivation of science during the last century, and of which the characteristic distinction was, to endeavour to turn its chief course towards the grand objects of public utility and domestic convenience. Upon this modification of the pursuits of natural philosophy, Condorcet very judiciously remarks, that " if the sciences have sometimes raised themselves too high towards heaven, and if it has been of advantage to recall them towards the earth, we must still shun the opposite error of condemning them to creep on it for ever." And when we see the paths of discovery open before us, we must follow boldly wherever they lead us, confident that, sooner or later, all theoretical knowledge may eventually confer some material benefit on society, even with regard to the more practical purposes of life. Duhamel indeed well knew the necessity of previous study and of extensive inquiry for the success of his experimental investigations; and the former half of a long life he spent chiefly in qualifying himself for making the observations which he recorded, and deriving from them the instructions which he published, in the latter. At a very advanced age his memory began to fail; he still continued his pursuits, but without reaping any advantage from his application; he attended the meetings of the academy, but took little or no interest in anything that passed at them; and after having been present at one of these meetings, on the 22d of July 1782, he had an attack of apoplexy, which wholly deprived him of his remaining faculties, and on the 13th of August put an end to his life.

A few years before his death he had felt very severely the loss of his brother, who had lived constantly at Denainvilliers, and had assisted him in many of his agricultural researches and meteorological observations, though he had always remained anonymous. His nephew, M. Fougeroux, had also been useful to him on several occasions in his literary pursuits; and this gentleman became heir to the principal part of the property of both his uncles. *Eloge*, by Condorcet, *Hist. Ac. Par.* 1782, p. 131. (T. Y.)

Duhamel, *Jean Baptiste*, born in 1624 at Vire in Normandy, was the son of an eminent advocate. He commenced his studies at Caen, and completed them at Paris. At eighteen he wrote a treatise on the Spherics of Theodosius, and a tract on trigonometry, designed as an introduction to astronomy. In 1666, when Louis XIV., on the recommendation of Colbert, established the Royal Academy of Sciences, Duhamel was appointed perpetual secretary, a situation for which he was eminently qualified. He was preparing a history of the academy, when he was cut off in the midst of his projects on the 6th of August 1706, at the age of eighty-two. He was a laborious student and a voluminous writer. He published numerous works on philosophy, divinity, and natural science.

DUILIUS, Caius Nepos (B. C. 260), a Roman consul, who gained a distinguished victory over the Carthaginian fleet on the Sicilian coast near Myle. This being the first naval victory of the Romans, Duilius enjoyed a splendid triumph, and was rewarded with the privilege of being attended whenever he had occasion to return from a banquet after nightfall by a torch-bearer and flute-player at the public expense. A column was raised in the Forum to commemorate his triumph, and was still to be seen in the days of Pliny and Quintilian. During the consulship of Duilius the Roman senate passed a decree forbidding the interment of dead bodies within the city.

DUISBURG, a town of Rhenish Prussia, capital of a cognominal circle in the government of Düsseldorf, between the rivers Anger and Ruhr, about a league above the confluence of the latter with the Rhine, and 18 miles north of Düsseldorf. Pop. (1849) 8948. It has a gymnasium and several minor schools, botanic garden, observatory, library, and orphan asylum. Manufactures—woollen and cotton goods, silks, leather, glue, tobacco, soap. It communicates by canal with the Rhine; has ship-building docks and a considerable trade. There are iron-works in the vicinity.

DUKE (Lat. *dux*), a sovereign prince, without the title or quality of king. Some sovereigns have the title of *grand duke*, as the Grand Duke of Tuscany and the Grand Duke of Muscovy. The title of grand duke belongs to the heir-apparent of Russia; and the title of archduke is given to all the sons of the house of Austria, and that of archduchess to all the daughters.

Duke is also a title of honour or nobility, the next below that of prince.

The word *dux* is derived, *a ducendo*, from leading or commanding. The first Roman *duces* were the *ductores exercituum*, leaders or commanders of armies. Under the later emperors, the governors of provinces in time of war were entitled *duces*. The same denomination was afterwards also given to the governors of provinces in time of peace. The Goths and Vandals, upon their overruning the provinces of the Western empire, abolished the Roman dignities wherever they settled; but the Franks, in order to humour the Gauls, who had long been used to that form of government, made it a point of policy not to make any change in these matters; and accordingly they divided all Gaul into duchies and counties, giving to the governors of these sometimes the names of dukes, and sometimes that of counts, or *comites*.

In England, during the Saxon times, Camden observes, the officers and commanders of armies were designated in the ancient Roman manner, without any addition; but after the Norman Conquest the title was disused. The order of duke in England is not of older date than the eleventh year (1335) of the reign of Edward III., who created his son Edward the Black Prince first Duke of Cornwall; a title which has ever since been the peculiar inheritance of the king's eldest son during the lifetime of his father, so that he is *dux natus, non creatus*. Subsequently several more dukes were created. In the reign of Queen Elizabeth, however, that is, in 1572, the order became utterly extinct; but it was revived in 1627 by her successor in the person of George Villiers, duke of Buckingham.

Though the French retained the names and forms of the ducal government, yet under their second race of kings there was scarcely any such dignity as that of duke. All the great lords were called *counts, peers*, or *barons*; excepting, however, the Dukes of Burgundy and Aquitaine, and the Duke of France, which was a dignity held by Hugh Capet himself, and corresponded to the modern dignity of

maire du palais, or the king's lieutenant. By the weakness of the kings, the dukes or governors sometimes made themselves sovereigns of the provinces intrusted to their administration.

The title of duke is no longer given to the governors of provinces, but has become a mere title of dignity, annexed to a person and his heirs-male, without giving him any domain, territory, or jurisdiction over the place of which he is duke. All the advantages of the title now consist in the name, and in the precedence which it gives.

The dukes of our days retain nothing of their ancient splendour except the coronet on their escutcheon, which is the only mark of their departed sovereignty. They are created by patent, cincture of the sword, mantle of state, imposition of a cap and coronet of gold on the head, and a verge or rod of gold in their hand.

The eldest sons of dukes are by the courtesy of England styled *marquises*, though they are usually distinguished by their father's second title, whether it be that of marquis or earl; and the younger sons are *lords*, with the addition of their Christian name, as Lord James, Lord Thomas, Lord Charles; and they take precedence of viscounts, though not so privileged by the laws of the land.

Duke-Duke, a title given in Spain to a grandee of the house of Sylva, on account of his having several duchies from the union of two considerable houses in his person.

DUKINFIELD, a township of Cheshire, on the left bank of the Tame, which separates it from Ashton-under-Line, of which it may be considered a suburb. Pop. (1851) 12,132, chiefly engaged in the cotton manufacture, iron-works, and collieries, which are extensive.

DULCIGNO (the ancient *Olcinium*), a seaport-town of Albania, in European Turkey, situated on the Adriatic, 15 miles W.S.W. of Scutari. Pop. about 7000. It is a place of some trade. The inhabitants were formerly notorious for their piratical habits.

DULVERTON, a market-town of Somersetshire, in a valley on the Barle, 25 miles W.S.W. of Bridgewater. It has some manufactures of woollens and silks. Market-day Saturday. Pop. 1497.

DULWICH, a hamlet in the parish of Camberwell, Surrey, 4½ miles S.S.E. of St Paul's, London. It is beautifully situated, and has numerous pretty villas. Pop. 1632. Dulwich is celebrated for its college, founded by Edward Alleyn in 1619. It contains a fine collection of paintings, chiefly of the Italian and Flemish schools. A more detailed account of this institution is given under ALLEYN, *Edward*.

DUMARSAIS, CESAR CHESNEAU, a French philologer, was born at Marseilles July 7, 1676. His life consisted of a succession of misfortunes; and his merits, considerable as they were, seem to have been entirely overlooked and neglected by his contemporaries. His father died while he was yet an infant; and his mother, by her extravagance, dissipated his patrimony. He was educated in his native town by the Fathers of the Oratory, into whose congregation he entered; but left them at the age of twenty-five, and repaired to Paris, where he married, and was admitted an advocate in 1704. He soon, however, quitted the bar, separated from his wife, to whom he gave up the little he possessed, and went to reside with the President de Maisons, in the capacity of tutor to his son. He was afterwards successively tutor to the son of Law, the famous projector, and of the Marquis de Beufremont. It was during this last period that he published the results of his grammatical investigations, which were received with great coldness. At a subsequent period he opened an establishment for education in the suburb St Victor, which scarcely afforded him the means of subsistence; and he expired, at length, under the accumulated pressure of years, infirmities, poverty, and neglect, on the 11th June 1756, at the age of eighty.

Dumarsais possessed no ordinary talents. His researches are distinguished alike by their accuracy, ingenuity, and depth. As a man, he combined the greatest purity of morals and simplicity of character with a rare degree of manly fortitude in the midst of his misfortunes; yet during the greater part of his life he was left to languish in obscurity, and his merits scarcely attracted any notice until nearly half a century after his death. His works on philosophy and general grammar, however, are worthy of attention. Of these, the best is his *Histoire des Tropes*. D'Alembert and Voltaire have both paid a just and discriminating tribute to the merits of Dumarsais. An edition of his works was collected by Duchosal and Millon, and published at Paris in 1797, in seven vols. 8vo.

In 1804, the French Institute proposed a prize for an *Eloge* on Dumarsais, which was gained by M. Degerando, whose work was published at Paris in 1805, in 8vo. A previous and well-written *Eloge* on the same author, by D'Alembert, is to be found in the *Mélanges de Littérature*, and prefixed to the above-mentioned edition of the *Works of Dumarsais*.

DUMBARTON (anciently called Lennox), a county in Scotland, situated between N. Lat. 55. 53. and 56. 25., and between W. Long. 3. 55. and 4. 53., consists of two districts, which are six miles distant from each other, and are separated by part of Lanarkshire. The western and larger district is about 35 miles long from N.W. to S.E., and 15 broad. It is bounded N. by Perthshire; W. by Argyleshire, from which it is separated by Loch Long; S. and S.W. by the river Clyde and Lanarkshire; and E. by Stirlingshire. The eastern district, which is about 12 miles in length from E. to W., and 4 in breadth from N. to S., is completely inclosed by the counties of Stirling and Lanark. The whole county contains 297 square miles, or 189,844 statute acres. It is divided into twelve parishes, of which there are only two in the eastern district, viz., Kirkintilloch and Cumbernauld. This last belonged to Stirlingshire, till the Earl of Wigton, whose property it was, became heritable sheriff of Dumbartonshire, and annexed it to this county.

The climate is on the whole salubrious, but much more humid than in many parts of Scotland. The prevailing winds are from the west and south-west, but easterly winds are frequent in the spring months. Frosts are seldom severe, and, except on the mountains, snow never lies long. The soils of the lower grounds are schistose clay mixed with small stones, rich black loam on the banks of the Clyde, and gravelly soil on the river Leven. About two-thirds of the county are hilly or mountainous. The most elevated portions are in the W. and N.W.; while in the S.E. is a generally flat district, watered by the Kelvin. Benvoirlich, in the N., attains an elevation of 3330 feet, and several other hills rise to a height of 3000 feet.

Coal, iron-ore, limestone, freestone, and slate, are its most valuable mineral productions. There are pits for working coals at Langfauld and Lawmuir in East Kilpatrick, and at Duntocher in West Kilpatrick, where great quantities are raised for the consumption of the cotton factories at Duntocher, and for calcining lime at the neighbouring lime works. Ironstone is found in considerable quantities in connection with limestone in the parishes of Kirkintilloch and Cumbernauld.

Limestone is found in the higher grounds at Kilpatrick, Dumbarton, and Row. It is wrought, in connection with coal, at Langfauld, Lawmuir, and Duntocher; and also at Row, Netherwood, and Cumbernauld.

Several slate quarries have been wrought with success at Luss, Camstradden, and Roseneath.

The only river of any note which can be said to belong to this county is the Leven, the outlet of Loch Lomond, which, flowing for about five miles through a fine valley, joins the Clyde at Dumbarton Castle. Its waters, which are singularly pure and soft, are well adapted for bleaching and printing cottons, branches of trade which are established to a

great extent along its course. The other streams are the Falloch, Inveruglass, and Douglas. The Clyde, Endrick, and Kelvin, flow along its borders. Loch Long and Gare Loch are arms of the sea, the first of which separates this county from Argyleshire; and the other, penetrating the land for about seven miles, nearly detaches the peninsula of Roseneath from the mainland. Additional water-carriage is provided by the Forth and Clyde Canal, which passes through the county for more than 16 miles. This canal is carried over the valley of the Kelvin by an aqueduct. The only remarkable lake is Loch Lomond, which is about 21 miles long, and in its greatest breadth towards the south above 7. It narrows to about one mile at its north end. About two-thirds of the shore, and most of its islands (thirty in all), are in Dumbartonshire; the rest belong to Stirlingshire. It is probably not to be equalled by any lake in Britain for the variety and magnificence of its scenery; the picturesque beauty of its wooded banks and islands affording a striking contrast to the rugged and lofty mountains that rise in its vicinity. It has an area of about 40 square miles.

The valued rent of the county in 1674 was L.33,327 Scots. The annual value of real property, as assessed in 1815, was L.71,587; and in 1849 was L.150,122. The principal gentlemen's seats are—Rossdhu, Sir James Colquhoun; Roseneath and Ardincaple, Duke of Argyle; Buchanan, Duke of Montrose; Gartscube, Sir James Campbell.

The county sends one member to parliament. The parliamentary constituency in 1853 was 1297.

The arable lands of Dumbartonshire are divided into farms ranging in extent from 30 to 300 acres, and some of them comprise as many as 700 or 800 acres. Of late years great improvements have been made in agriculture, and in the breed of all kinds of stock. The rotation of crops is almost universally practised. Wheat, oats, potatoes, and barley, constitute the principal crops. Leases are held generally for nineteen years. The dairy stock is principally of the Ayrshire breed, and much progress has of late been made in this department. Great improvements have also been introduced in the construction of farm-buildings, and in the fences of the land.

There are in this county many excellent tracts of pasture land. Sheep of the black-faced breed, and a limited number of black cattle, are reared with great success. The sheep are disposed of in Glasgow, where there is a weekly sale; and great numbers of cattle are sold at the Carman market, for the purpose of being fattened on the rich pastures of the south. In the highland district, farms for grazing are necessarily of great extent. But it is not uncommon for fishermen and mechanics to hold pendicles, or "poffles," as they are called, below L.12 of rent; and the cottars, who are usually employed as labourers on the larger farms, rent small patches of arable ground for raising potatoes, with hill pasture for a cow.

The woods and plantations of this county are extensive and valuable, and yield to the proprietors a yearly income almost equal to the rent of the arable lands. On spots unfavourable to oak, the coppice woods consist of ash, yew, holly, mountain-ash, birch, hazel, aspen, alder, crab, thorn, and willow. The soil and climate of this county are particularly favourable to plantations, which begin to make a return to their owner in ten or twelve years, and in thirty years afford supplies to the carpenter. The most extensive plantations are on the estates of Luss and Bonhill. On the banks and islands of Loch Lomond there is a considerable number of yew trees, some of them of large size, and evidently of a very great age.

The manufactures of this county are various and extensive. There are extensive cotton factories at Duntocher; several paper-mills at Dalmuir; five extensive ship-building yards at Dumbarton; and along the course of the Leven are numerous print-works and bleach-fields. According to the census reports, the population of Dumbartonshire since 1801 was as follows:—(1801) 20,710; (1811) 24,189; (1821) 27,317; (1831) 33,211; (1841) 44,296; and (1851) 45,103. Of these last 22,400 were males, and 22,703 females. The number of persons engaged in the cotton manufacture in 1851 was 4071; in calico-printing, 2581; in the manufacture of paper, 165; in the coal mines, 549; while the number of those engaged in agriculture amounted to about 4000. In 1851 there were 55 places of worship in the county, 51 of which having 26,517 sittings. The principal of these were 16 Established churches, 15 Free churches, 10 United Presbyterian, 2 Episcopalian, 2 Independent, 2 Baptist, 2 Wesleyan Methodist, and 2 Roman Catholic. There were also 75 day and 59 Sunday schools, the former having 4778 scholars (2625 males and 2153 females), and the latter, 4966 (2277 males and 2689 females). Of the day schools 10, with 819 scholars, were supported by general or local taxation; 7, with 431 scholars, by endowments; 21, with 1340 scholars, by religious bodies; while 8, with 608 scholars, were subscription schools.

Dumbarton, a royal parliamentary and municipal burgh and seaport-town of Scotland, capital of Dumbartonshire, is situated at the confluence of the rivers Clyde and Leven, 13 miles N.W. from Glasgow. It is a very ancient place, and is said to have been once the capital of a kingdom of the Britons established in the vale of the Clyde. Alcluyd was the name of this ancient capital of the Strathclydenses; but whether it was situated on the site of the present town, or confined within the precincts of the castle, cannot be exactly ascertained. Dumbarton was erected into a royal burgh by Alexander II. in the year 1221, and declared to be free of all imposts and burgh taxes. It afterwards received other charters from succeeding monarchs; and, finally, it obtained a confirmation of the whole from James VI. The town is built upon the eastern bank of the Leven, which almost encircles it; and is chiefly composed of one main street, lying in a semicircular form round the head or west end of the peninsula. A good stone bridge of five arches, 300 feet long, connects the town with a suburb on the western side of the Leven. The waters of the Leven form the harbour, and, for the benefit of trade, a quay and dock have been formed. The commercial prosperity of the burgh has been remarkable during the last few years, in consequence of the rapid extension of shipbuilding, its staple manufacture. It possesses five large shipyards employed in the construction of wooden and iron vessels, chiefly the latter; two marine engine-works; two foundries; one rope manufactory; and Dennystown forge, among the largest and most unique in Britain, both as respects the building itself, and the machinery employed. The municipal corporation consists of a provost, 2 bailies, 15 councillors, &c. It is a contributory borough to Renfrew. The parish church is a handsome modern structure. There are also in the town a Free church, two United Presbyterian churches, an Episcopalian and a Roman Catholic chapel. It has also a grammar-school, savings-bank, news-room, and library. The situation of Dumbarton Castle is eminently picturesque. The buildings composing the fort are perched on the summit of a rocky mount, shooting up to the height of 206 feet sheer out of the alluvial plain on the east side of the debouche of the river Leven. To the west of the castle there are rocky eminences on the verge of the Clyde, of a similar form, though less isolated. The rock of Dumbarton measures a mile in circumference at the base. It diminishes in breadth near the top, which is cloven into two summits, of different heights. The rock is basalt, and has a tendency to columnar formation. Some parts of it have a magnetic quality. The fortress, naturally strong, possesses several batteries, which command a very extensive range. According to a provision in the treaty of union, the defences are

kept in constant repair, and a garrison is maintained in the castle. Dumbarton is a station on the line of railway between Bowling and Balloch; and is in constant communication with Glasgow, Greenock, &c., by means of steamers. Pop. 4590.

DUMBNESS. See Deaf and Dumb.

DUMFRIES, a county in the south of Scotland, is situated between 55. 2. and 55. 31. N. Lat.; and 2. 39. and 3. 53. W. Long. Its greatest length is nearly sixty miles, and its greatest breadth from thirty to thirty-one. The boundaries are Kirkcudbright and Ayrshire on the S.W.; Roxburgh, Selkirk, and Peebles, on the N.E.; Lanark on the N.; and on the S. the Solway Firth and the county of Cumberland. The principal rivers are the Nith, the Annan, and the Esk, all of which discharge themselves into the Solway Firth. These rivers are fed by numerous tributaries, and the whole of them abound in salmon. The square miles of the county are calculated at 1129, and the acres at 722,813. Like many other Scottish counties, Dumfriesshire is popularly divided into districts. Of these there are three principal; Eskdale on the east, Annandale in the middle, and Nithsdale on the west; each taking its name from the river which traverses it. From these larger divisions diverge smaller vales, which likewise derive their titles from the streams that flow through them, such as Moffatdale, Dryfesdale, and Ewesdale. From various circumstances, the limits of these great divisions are but imperfectly defined, and have recently been abandoned. The Solway Firth waters the base of the county for twenty-four miles, and along its margin the land is generally flat for about ten miles. Beyond this the county expands into a series of hills and valleys, which rise gradually northward till they reach the mountain chain which bounds it in that quarter. The principal elevations are, Lowthers near Wanlockhead, which rises 3150 feet, and Hartfell in Annandale, which rises 2629 feet above the level of the sea. In former times it was said that 86 square miles were in general low arable land, lying on the sea-coast, 322 miles chiefly hilly, and 598 mountainous. But this distribution has been disturbed by the steady progress of bone manure and green-crop husbandry. Steeps which it was impossible to sharpen by common manure, from the expense and difficulty of transporting it thither, have been brought into excellent heart by ground bones, and improved by at least 100 per cent. both as crop and pasture land. Many hills which were nearly bare have been covered to their tops with thriving plantations. Since 1810 the Dukes of Buccleuch have inclosed and planted 6600 acres of land; extensive additions are contemplated. Large sums of money have been expended in road-making and fencing. Still a large proportion of the county is mountainous, and is devoted almost exclusively to sheep farming, which, since the mortality of 1829, has again become very profitable. Judging from the map, nearly a third of the land in the county belongs to the Duke of Buccleuch, who possesses a rental of nearly L.200,000 yearly, L.80,000 of which are drawn from Dumfries-shire. In 1811, when the property-tax pressed on the energies of the country, the whole rental of the county was estimated at L.246,001, 12s. 6d.; and although rents have fallen greatly since that period, so marked has been the progress of improvement, that at present (1854) it has risen to L.334,272, made up thus: lands L.280,885; houses and tenements, L.46,287; quarries, mines, fisheries, gas-works, L.7100. The principal proprietors are the Duke of Buccleuch, the Marquis of Queensberry, and the Earl of Mansfield; Mr Hope Johnstone of Raehills, General Sharpe of Hoddam, Mr Rogerson of Dumcrieff, Mr Douglas Baird of Closeburn, and Mr M'Alpine Leny of Dalswinton.

The climate of Dumfriesshire is mild and salubrious. Much of the land has a southern exposure, and, excepting in very severe winters, the snow speedily disappears. The soils are gravel or sand loam, and clay, with moor and moss in some places, particularly along the bed of the Lochar, with alluvial tracts on the banks of the rivers and the Solway Firth. The farms vary greatly in size; but for years there has been a tendency to uproot almost entirely the pendicle system. On the Buccleuch estates the farms are generally extensive. Many excellent steadings of houses have been built, and subdivisions formed over waste tracts, which for centuries remained uninclosed. The usual rate of wages for a ploughman is from L.6 to L.10 per half-year, with board and lodging in the case of unmarried men, and a proportionate allowance of meal, potato-land, &c., for hinds with families. House and dairy maids receive from L.3 to to L.3, 10s. per half-year; day-labourers 1s. 6d a-day in winter, and 2s. in summer.

At one time the quantity of lime used, or at least worked, in Dumfriesshire, was very great, and it is still considerable. The principal pits are those of Kilhead, Closeburn, and Barjarg; and within the last fifteen years the supply was estimated at 1,200,000 Winchester bushels, valued at L.54,000. The capabilities of the pits are still great, but the demand for lime has diminished, owing to the increasing use of bone-dust, a manure which unites to a certain extent the qualities of lime and common dung. Mr Menteath of Closeburn was a great land improver, and converted bogs which were hardly worth five shillings an acre into some of the finest pasture land in the county, by the combined effects of pairing, careful selection of seed, the application of lime, and irrigation. Cattle and sheep are bought at the Falkirk trysts, and fattened during winter and the early part of spring. The latter branch of traffic is yearly extending. The indigenous breed of cattle is still the Galloway, although not always pure and unmixed. Of heavy or drove cattle, about 20,000 head are driven south annually, and their value in good years amounts to nearly L.200,000. Mr Charles Stewart of Hillside, who has devoted much attention to agricultural statistics, gives the following valuable information respecting the present state (1854) of Dumfriesshire:—"In addition to drove cattle, there are also sent to other markets in the northern counties of England, Galloway heifers bred in Dumfriesshire, and West Highland cattle kept a year in the county, of both sorts about 8000, and at an average value of L.8 a-head. Taking both these, the produce of the county may be about L.120,000. Of fat cattle, between 2500 and 3000 are stall-fed for the butchers; about one-half of which are consumed in the county, the other sent to Liverpool—value in all about L.40,000. The sheep are of three kinds—black-faced, Cheviots, and half-breds, the latter being a cross between the Leicester and the Cheviot. Rather under half the extent of the county is still occupied entirely by pure Cheviot or black-faced breeding stocks, of which five-sixths are Cheviot. The whole number of both is about 150,000. The annual sale from these are—lambs, 80,000; draft ewes about 22,000. The lower hill pastures with portions of the arable farms are occupied with Cheviot and black-faced ewes (four-fifths of the former) crossed with Leicester rams, and may amount to nearly 90,000. These produce almost but not quite one lamb for every ewe, say 85,000. On the arable farms, winter-fed nearly all on turnips, there are at least 110,000; of which in average years there may be 20,000 ewes and Highland wedders, and the remainder lambs or hogs, partly pure Cheviots and partly Leicester crosses, there being rather more of the latter. Then of the 165,000 lambs sold, one-half or rather more are fed in the county, and the other sold out of the county. Total sheep in the county, computed in November yearly, 350,000. Taking the last three years, the gross returns to the farmers would be—cattle store L.120,000, fat L.40,000, total L.160,000. Sheep, first class, 150,000, giving an annual clear return of 11s. each, L.82,500; second class, 90,000,

do. of 16s., L.72,000; third class, 110,000, do. of 17s., L.93,000. Total L.248,000. Exclusive of this, there are sales *off* the farms, the produce of the dairy cows and grain; but these do not amount to L.100,000. Allowing another L.100,000 for the produce of pigs, we have thus the sum total of L.608,000 of *sold* produce for the county of Dumfries."

Swine-rearing is much cultivated in Dumfriesshire and Galloway; and a large proportion of the hogs reared in the stewartry are sold in Dumfries, and cured in Annandale and Cumberland. The curing trade lasts for about three months, commencing in December and ending in February. The sales are all paid in ready money; and instances have occurred in which green pork to the amount of L.6000 has been sold before breakfast-time on a market-day. The curers have good and bad seasons; but the capital required induces caution, and it is a fact that bankruptcy is nearly unknown among the bacon traders of the district. The hams of Dumfriesshire are so much esteemed that they are frequently sold in London under the name of Westphalian. Those who farm pendicles trust mainly to their pigs when rent-day comes round; and the trade every year brings L.2000 into Johnstone. Its annual value to the district, including the curer's profit, must be very nearly L.100,000 sterling.

The manufactures of the county are dressed leather, hosiery, clogs, and carpets. The cotton mill at Langholm has ceased to work, and such weavers as remain there are supplied with webs by the manufacturers of Carlisle. In Dumfries and other parts of the district the weaving population derive employment from the city of Glasgow. The hosiery trade exceeds L.30,000 per annum; but that of dressed leather has much decreased. The carpet and spinning and dyeing manufactory at Crawick Mill, in the neighbourhood of Sanquhar, employs 150 persons, young and middle-aged. It consumes nearly 5000 stones of wool, and produces 70,000 yards of carpeting yearly. The wages average from L.180 to L.200 monthly.

Although, as we have already remarked, Dumfriesshire is mountainous, its lakes are inferior to those of Galloway, both as to number and extent. We must make an exception, however, in favour of the Castle Loch of Lochmaben. Bruce's castle stood on a promontory on the farther side of the loch; but it is so much dilapidated that such artists as sketch it contrive to hide the nakedness of bare unashlared walls by the enlivening screen of green trees. In some of the lakes a singular fish is found, known under the name of vendace, and which is supposed to be peculiar to this place, if we except, perhaps, the lake of Geneva. At the "four towns of Hightae," in the neighbourhood, King Robert granted feus to a class of persons who were known as "the king's kindly tenants." Their possessions are small, but the land is rich, and they sit at almost a nominal rent. They are a peculiar race, who live in a little world of their own, and are beginning to feel the effects of continued isolation and intermarriage among the members of their own tribe. Loch Skene, about ten miles from Moffat, is the only other lake of consequence. It is 1300 feet above the level of the sea; the scenery around is stern and savage in a high degree; and its superfluous waters, in escaping to the strath or valley below, foam and leap from the dizzying heights above, and form the fine cascade called the Gray Mare's Tail.

Considerable quantities of salmon are caught in the Nith, and in the stake-nets at Caerlaverock and Annan Water Foot. The finny tribes push into other streams, such as the Milk, the Esk, the Ewes, and the Wauchope; and in former times were speared in Moffat Water. The supply of red fish is augmented by importations from Galloway.

The lower parts of Dumfriesshire consist of different varieties of sandstone, the strata of which generally dip to the Solway. There is a considerable body of limestone, as we have already observed. Iron in different forms is also found in the strata. Marl abounds in various parts; and of freestone and whinstone there is abundance everywhere. Marble is also procured, and employed for some purposes. A little slate is likewise found. Coal in considerable quantities exists at the two extremities of the county, Sanquhar and Langholm; and, with one or two exceptions, all the pits belong to the Duke of Buccleuch. Lengthened land-carriage prevented the tacksmen from competing with the coal miners of England; and consequently the town of Dumfries and many parts of the county were supplied with fuel from Workington and Maryport; but the opening of the Glasgow and South-Western railway has completely changed the state of matters. Abundance of coals is now supplied from Kilmarnock, Cumnock, and Sanquhar. The lead mines at Wanlockhead belong to the Duke of Buccleuch, and are distant two miles from Leadhills in Lanarkshire, which belong to the Earl of Hopetoun. Both have declined greatly from the increased difficulty of working the shafts, and the poverty of the ore. For 30 years previously to 1828, each of the places mentioned produced about 700 tons of melted lead annually; the price L.23 per ton, and the gross revenue L.20,700. The Duke of Buccleuch now works Wanlockhead mines on his own account, and erected in 1846 a mill for separating the silver from the lead. The following are the quantities of silver and lead procured during the last six years.

1848............	4168	oz. of silver.	614	tons of lead.
1849............	5307	...	797	...
1850............	5286	...	715	...
1851............	4596	...	701	...
1852............	3774	...	549	...
1853............			530	...

During that period the price of lead has varied from L.15 to L.20 per ton. The number of persons employed on Wanlockhead at present (1854) amounts in all to 245. Each miner on an average may be supposed to earn at present L.28 during the year. Whether we regard the comforts or the intelligence of the mining population, we shall find it equal, and even superior, to that of any former period.

The mineral waters of Moffat are well known; but the spas in other parts of the county are too obscure to require special notice. The chalybeate at Hartfell acts as a powerful tonic, and contains, of sulphate of iron 84 grains, sulphate of alumina 12, oxide of iron 15, and 5 inches of azotic gas, in a wine gallon. This spring was discovered about 100 years ago, but is too remote from the village to be of much use. The other spring, which is much more accessible, is strongest and best at the fountain-head, and probably the walk or ride (about a mile and a half) does as much good to invalids as the water. The Moffat Spa contains, muriate of soda 36 grains, sulphuretted hydrogen gas 10 cubic inches, azotic gas 4 inches, carbonic acid gas 5 inches. More than two centuries have elapsed since this spring was discovered. Many years ago baths, with a pump and reading-room, were erected by subscription in Moffat, at an expense of L.2000; an immense improvement, which has greatly increased the annual number of visitors. Annan, Lockerby, and Langholm, are all thriving, well-built towns. The scenery of the latter place is much admired, particularly the ride along the banks of the Esk to Longtown.

The county sends one member to parliament, and the united burghs of Dumfries, Annan, Lochmaben, Sanquhar, and Kirkcudbright, a second. The population amounted in 1841 to 72,830, and in 1851 to 78,123. The parliamentary constituency in 1853 was 2530.

Dumfries, the capital of the above county, is a royal burgh of considerable antiquity, although the period at which it became incorporated is not exactly known. During the border wars it was frequently stormed, and the public records were destroyed. The current belief, however, is, that it received its charter before the middle of the eleventh cen-

tury, as a gravestone was discovered a number of years ago, bearing the date 1079, and mentioning that the individual whose ashes it covered had been conspicuous as a merchant and burgess of the town. From this time it gradually increased in importance; and in the year 1307, Edward the Second appointed the estates of Scotland to assemble on the banks of the Nith. In certain chronicles the ancient name of the town is said to have been *Cotiac*, but this we suspect is mere fancy. It seems much more probable that, like many other places, it derived its name from its physical appearances and character. In remote times the Gaelic was spoken on both sides of the Firth of Forth; and we concur in the etymology of Mr George Chalmers, who conceives the word to be composed of *dun* a castle, and *fries* a ridge. Dumfries, which may be regarded as the capital of the south of Scotland, is beautifully situated on the left bank of the river Nith, 35 miles below its source, and upwards of 10 above the point where its waters mingle with and are lost in the Solway. The Nith in point of size ranks fifth among the rivers of Scotland, and is navigable from Carsethorn to Glencaple quay, even for vessels of considerable burthen. In consequence of the extraordinary manner in which the tides ebb and flow in the Solway during the winter months, the river is similarly affected.

The origin of the town appears to have been owing to a strong castle, which flourished as a border fortress during the twelfth century, and frequently became an object of contention, both prior and subsequent to the times of Wallace and Bruce. Of this stronghold not a vestige remains; but the street occupying the ground on which it stood retains the name.

In razing what remains of this place of strength, the local authorities, more than a century ago, found materials for building the new church. The Gray Friars, like the castle, attracted settlers; and, as early as the thirteenth century, the old bridge was planned and built at the expense of the Lady Devorgilla, third daughter of Alan, lord of Galloway, and grandmother to John Comyn, who was slain by Robert Bruce in the above-mentioned cathedral in the beginning of the year 1305. Originally it consisted of thirteen arches, and was guarded at the middle by a gate or port, which was removed in 1769, to lessen the central pressure when the structure became frail. This bridge, which still remains, and is crossed every day by foot passengers, was certainly a wonderful erection for the time; and, accordingly, the writer of a work entitled *A Journey through Scotland*, published by J. Pemberton, London, in 1723, says, "I passed the river Nith from Galloway to Dumfries over a fair stone bridge of thirteen arches, the finest I saw in Britain next to London and Rochester." A right of toll was attached to the bridge, which in 1789, according to Captain Grose, yielded a yearly rental of L.300, and which at the present day, a little higher up the river, produces to the town L.500 sterling. The new bridge was commenced in 1793, and finished in 1795. The original contract price was L.4500; but as no rock could be found at one point, the landstool on the Dumfries side was founded on piles of wood, and for this the commissioners of supply allowed an additional sum of L.500.

After Bruce had committed the crime already mentioned, and commenced that career which terminated at last in the redemption of his country from a foreign yoke, he became a mark for the vengeance of Edward of England. His friends and adherents also suffered along with him. Amongst these, Sir Christopher Seaton was betrayed by a pretended friend of the name of Macnab, apprehended at the Castle of Lochore in Fifeshire, marched to Dumfries, and barbarously executed on the Gallows-Hill, a slight eminence on the north-eastern side of the town, better known by the name of the Christell Chapel. Bruce sincerely regretted his fate, and, in the words of Sir Richard Maitland of Lethington, said, "'It is ane pity that sa noble ane knight should die sa cruel ane dead.' And incontinent in the same place where he was standing when the tidings came to him, garred found a chapel in honour of the Virgin Mary; and, in remembrance of the said Sir Christell, founded a priest to devine service therein perpetually, and pray for the said Sir Christell; and gave to the said priest and his successors the sum of L.5 sterling, to be taken of the barony of Carlaverock, for their sustentation." The ruins of the Christell Chapel were visible in the beginning of 1715; but when the Jacobite rebellion broke out in Scotland, the inhabitants of Dumfries hastily constructed a rampart, and during the operation the ruins of the old chapel disappeared, the line of fortification having passed close by their site. It is evident, from the traces of the foundation, that the building must have been very small. When Lord Scroop made an excursion in 1570 for the purpose of plunder, the chief magistrate of Dumfries, at the head of the burgesses, joined Lord Maxwell in opposing the invaders. They fought gallantly, but were at length defeated. Dumfries suffered considerably during the reigns of Charles I. and II. In 1617 it was visited by James VI. whilst returning to England. It was at this period that the incorporated trades received from James what is called the "siller gun," which was ordered to be shot for at stated periods, with the view of fostering their martial spirit, and skill in the exercises performed at the wappinshaw. This relic is still in existence, and the custom till lately was observed at the distance of seven or nine years, more as a holiday exercise than for any other purpose. The trades mustered in great strength, borrowed guns far and wide, spent three-fourths of the day in shooting, returned to an entertainment in their hall in the evening; and the "siller gun," after being won, was worn for a short period by the best marksman. This festival forms the subject of a poem, written by Mr John Mayne, and which is praised for its humour and spirit in the notes appended to the *Lady of the Lake*.

Almost no town in Scotland stood forward half so prominently as Dumfries did at the period of the union in 1707. On the 20th of November of the preceding year, according to Chalmers, two hundred Cameronians entered the burgh, issued a manifesto against the great pending measure, and burnt the articles at the market-cross. The last commotion of any consequence occurred in 1715, when the Viscount Kenmure hung on the heights of Tenwald, willing to do mischief, and yet timid as to the means and manner of attack. By a well-managed stratagem he was induced to depart; and this is believed to have been the last occasion on which the ancient war-cry of the town, "Loreburn," or "A Loreburn," was heard.

Dumfries is the seat of a presbytery, synod, sheriff's court, record of sasines, and seven banks, branches of the principal companies of Scotland. There are three churches in connection with the Establishment, an Episcopalian, a Catholic, and a number of other chapels supported by Dissenters.

In 1745, the Pretender and his rebel army, whilst retreating from England, paid a domiciliary visit to the town of Dumfries; and for a misdemeanour committed against some of his followers on their march southward, the town was compelled to pay a fine, which amounted altogether to L.4000 sterling. In 1750, however, the crown granted to Dumfries L.2800 out of a forfeited estate.

Hosiery, leather, hats, wooden shoes, and baskets, are the only manufactures worth naming in Dumfries. Cotton checks at one time were woven on speculation in considerable quantities; but the trade has declined. The stocking trade gives employment to about 300 persons, and produces annually not less than L.30,000 sterling. At Kingholm Mills, the property of Messrs Scott, near Dumfries, there are spinning frames in operation, each containing 1200 spindles, which produce per frame 750 miles length of yarn daily, with

the aid of only one man and four young persons. The tanning trade, as regards value, is very considerable. The extensive grazing district in the midst of which Dumfries stands produces annually large quantities of hides, notwithstanding the great number of bullocks that are driven south; and in good years dressed leather brings a return amounting to about L.30,000. Wooden shoes or *sabots* were long peculiar to Dumfriesshire and the lower part of Galloway; but the trade is increasing. These promote greatly the health of such as are exposed to outdoor labour. Of these shoes more than L.1000 worth are annually disposed of in Dumfries alone.

In the year ending 10th June 1854, the tonnage of Dumfries stood as follows: Foreign vessels inwards 959 tons, coasting do. 6866, goods 4935, coal 3654, and lime 222; income to the commissioners of navigation L.385, 5s. 4d., it having been in 1831, L.870, 12s. 8d. In the same year vessels that cleared outwards paid duty on 712 tons register, and on goods 2475 tons, yielding L.150, 6s. 3d. Total revenue for year, L.585, 11s. 7d. Foreign vessels are charged at the rate of 6d. per ton, coasters 2d.; goods 1s. 2d., and lime and coal 1d. The revenue and tonnage have decreased greatly since the opening of the Glasgow and South-Western Railway Company. The navigation of the Nith has been much improved of late years by the formation of embankments, and the deepening and straightening of the course of the river. The exports consist chiefly of grain, bark, wool, and hosiery; and the imports of coal, timber, and goods.

The infirmary was built more than 70 years ago, and the hospital or poor-house in 1753. Both are well endowed, though supported partly by subscriptions; and the former expends fully L.1100 annually on medicine and other necessary outlays. Its present capital amounts to L.8400. The infirmary, since the time it was founded, has received in the shape of donations L.18,000, and the hospital L.6000; and the expenditure of the latter is about L.600 annually. In connection with such institutions it may be noticed that the late Dr Crichton of Friar's Carse left in 1823 upwards of L.100,000 to his widow and certain trustees to be applied to such charitable purposes as they might think proper. With L.60,000 of this money the Crichton Royal Institution for Lunatics has been erected near to Dumfries. A building for first-class patients was opened in 1839, and the Southern Counties' Institution for paupers from the shires of Dumfries, Kirkcudbright, and Wigton was opened in 1849. Paupers are supported and clothed for L.17 each. Dumfries possesses an excellent academy, where Greek, Latin, French, English, mathematics, geography, drawing, &c. are taught. It has also a very handsome theatre. In 1826 a gas-work was erected in Dumfries, and has since flourished well. There is a weekly market, which is held on Wednesday, when a great deal of business is transacted.

St Michael's churchyard attracts the notice of all strangers. It is to a great extent a city of tombs, and has been frequently referred to as the Westminster of Scotland. Many of the monuments are very beautiful; and amongst these there is a sumptuous one over the ashes of the celebrated poet Burns.

The situation of Dumfries is admired by all tourists. With the exception of the point where it dips to the ocean, it is surrounded by a chain of hills, many of which are green to the top, and undulate in a very pleasing manner. In point of latitude, Dumfries is nearly a degree farther south than Edinburgh, and considerably more than a degree in climate. The chilling east winds which prevail so much on the east coast of Scotland are but little felt on the banks of the Nith; and pulmonary complaints, though not unknown, are comparatively unfrequent.

The parliamentary boundary of the burgh, which differs from the municipal, consists of part of the parish of Dumfries, containing 12,298 inhabitants, and parts of the following parishes, viz. Terregles, containing 566 inhabitants, and Troqueer, containing 4925 inhabitants (both in the stewartry of Kirkcudbright). Total pop. (1851) 13,166.

DUMONT, Etienne, or Stephen, the friend, and often the Mentor, of Mirabeau, the redacteur of the principal works of Jeremy Bentham, and one of the most remarkable men of his time, was born in the month of July 1759 at Geneva, of which his family had been citizens or good repute from the days of Calvin. Shortly after his birth his father died, leaving a widow and five children wholly unprovided for. But the good widow, though placed in such destitute circumstances, and supported by little except the courage inspired by maternal affection, found means to educate her children in a place where necessary knowledge was accessible, and poverty not disgraceful. Induced by an anticipation of future eminence, seldom more happily realized, she accordingly contrived to send Stephen to the College of Geneva, where he justified her determination and the sacrifices necessary to carry it into effect, not only by his ability and proficiency, but by the virtuous purpose to which he turned his earliest attainments; for ere long, he not only defrayed the cost of his own education, but even contributed to the support of the family, by assisting the private studies of his comrades in the capacity of *répétiteur;* an office somewhat resembling that of a private tutor in our academical system, and having for its object to prepare the students for examination in the public class, by "grinding" them on the contents of the preceding lecture. Having completed his academical course, he took clerical orders; and in the year 1781 he was chosen one of the pastors of the city, where his talents as a preacher soon attracted general notice, and gave promise of his becoming one of the most brilliant and persuasive of pulpit orators. But the political troubles which disturbed Geneva in 1782 suddenly turned the course of his life into a different channel.

Two parties of opposite principles, one being attached to the authority of the magistrates, and the other anxious to extend the privileges of the people, but most widely separated as to the extension or limitation of the right of suffrage, had long divided that republic; and the disputes of these parties gained lustre from Jean-Jacques Rousseau, the most wayward, moody, and perverse of all the men of genius who have approached the borders of insanity, which, indeed, he appears more than once to have overpassed. The more liberal party received the name of *représentans*, or *petitioners*, from a representation presented by them against the legality of the proceedings of the magistrates respecting the writings and person of that celebrated but unhappy man; whilst, on the other hand, the magistrates, who refused the prayer of the petition, and their adherents who supported them in this refusal, were thenceforward called the *negatives*. During twenty years a struggle had been maintained between these parties with various success, but without bloodshed, though certainly not without violence. At length, in the autumn of 1782, when the petitioners had gained the ascendency, the courts of Versailles and Turin, in concert with the canton of Berne, surrounded Geneva with an armed force, and, under pretence of some ancient guarantees, imposed a new constitution on the republic, and at the same time compelled the leaders of the representative party to fly from their country.

Dumont was not included in the proscription. But his heart had been touched with the love of liberty; he could endure chains nowhere patiently, and chains at home, where he was free by birthright, not at all. He therefore became a voluntary exile, and went to join his mother and sisters at St Petersburg, a city to which many Genevese had carried their honourable patrimony of ability and

knowledge. In this he was probably influenced in part by the example of his townsman Lefort, who was the first tutor, minister, and general of the Czar At St Petersburg he became pastor of the French church, an office he filled for eighteen months, during which time he obtained the consideration due to his great merit and excellent character. But his views were directed towards Great Britain, where most of the Genevese exiles had taken refuge, and where some of them were actually employed in negociating with government for permission to establish a Swiss colony in Ireland. He left St Petersburg in 1785; and soon after his arrival in London went to reside with Lord Shelburne, then a minister of state, who confided to him the education of his sons. Lord Shelburne, afterwards Marquis of Lansdowne, a man distinguished for his cultivation of the society of men of letters, foreign as well as native, soon discovered the great talents of Dumont, who gradually became a friend, or rather member of the family; and it was at the house of this minister that he became acquainted with some of the most illustrious men of the country, amongst whom may be mentioned Fox, Sheridan, Lord Holland, and Sir Samuel Romilly. His connection with these and other distinguished individuals, founded upon friendship, similarity of opinions and literary occupations, and the pursuit of great objects of public utility, gave them full opportunities of appreciating his worth. He was generally known as a man of profound knowledge, correct judgment, irreproachable character, and brilliant wit, and esteemed for the possession of these high and invaluable qualities, which were exemplified throughout the whole course of his life.

About this time began his close connection with Sir Samuel Romilly, "a man," says Sir James Mackintosh, "whose whole excellence will be little understood by the world, until they see the narrative traced by himself of those noble labours of self-education, by which he taught himself every sort of ability which is necessary to serve mankind, and still more of that self-discipline by which he at length formed a character yet more exalted than his genius, composed of a probably unparalleled union of tender affection with unbending principle, and producing those dispositions towards the magnanimous and heroic which were hidden from the vulgar by the solemn decorums of a formal profession, and are seldom found to be capable of breathing so long under the undisturbed surface of a well-ordered and prosperous community. The habitual or mechanical part of Romilly's life was necessarily governed by those of his profession and country. The higher element, however, secretly and constantly blended itself with every thought and feeling; and there were moments when his moral heroism carried the majesty of virtue into the souls of the perplexed and affrighted vulgar." The friendship which united these two remarkable men increased daily; nor did its ardour or activity cease, until death unexpectedly rent asunder the tie which bound them together, and left Dumont inconsolable for the loss of his departed friend, whom he never mentioned without tears. There was a third in the circle, who is very strikingly described by Sir James Mackintosh.

"Among the closest friends of Romilly and Dumont was George Wilson, a man little known beyond the circle of his friends and that of his contemporaries in the profession of the law, and one whom it would be difficult to make known to others, without the use of that language of vague panegyric, the abuse of which had more lowered it in his own eyes, than even in those of most men of modesty and taste. It might be said by as unaffectedly conscientious a man as himself, if such another there be, that among those who thoroughly knew him, the degree of esteem for him was always considered as exactly indicative of the degree of sagacity and purity of the man who entertained it. Yet even he was not more upright and benevolent than his two friends; though, having less vivacity than the one and less ardour than the other, he was not so liable to be allured by imagination from the rigid observance of the severe maxims of that moral prudence which is the safeguard of virtue. With a keen relish for pleasantry, and perfectly exempt from all gloom and harshness, he yet shunned the amusement of Wilkes's conversation, solely from deference to morality. When Mirabeau visited England about 1786, Wilson did not follow the example of his friends in cultivating the society of that extraordinary man, whose ill-trained fancies were better adapted to sudden felicities than to composition, and whose conversation was animated by an irregular benevolence, neither smothered by the profligacy of his youth, nor altogether extinguished by the intrigues and corruptions of his latter years."

In 1788 Dumont undertook a journey to Paris in company with Romilly; and it was under the auspices of the latter that he first became acquainted with Mirabeau. During a sojourn of two months in the French capital, he saw that extraordinary man almost every day; and a certain affinity of talents and pursuits led to an intimate connection between two persons diametrically opposed to each other in habits and in character. It was after his return from Paris that Dumont commenced his acquaintance with Mr Bentham; a circumstance which exercised a powerful influence over his future opinions, and, as it were, fixed his career as a writer on legislation. Filled with admiration for the genius of Bentham, and profoundly impressed with the truth of his theory, and the important consequences to which it immediately led, Dumont applied all his talents to make the writings of the great English jurist generally known, and devoted the greater part of his life in order to render available to the world at large the inexhaustible store of knowledge which the active mind of Bentham was continually increasing. We may mention here, that the following works are the result of that confraternity of genius, talents, and labour, which was thus established, viz. *Treatises on Legislation*, published in 1822, in 3 vols. 8vo, now (1833) in the third edition; *Theory of Punishments and Rewards*, 2 vols. 8vo, also in the third edition; *Tactics of Legislative Assemblies*, two editions, 1815 and 1822; *Judicial Evidence*, published in 1823, second edition 1830; and *Judicial Organization and Codification*, 1828, 8vo. Of course we make no mention here of the numerous editions published in foreign countries.

In the summer of 1789, that season of promise and of hope, especially to a Genevese exile, Dumont suspended his labours in England in order to proceed to Paris along with his friend Duroverai, ex-attorney-general of the republic of Geneva. The object of the journey was to obtain through M. Necker, who had just returned to office, and by means of the events which were then passing in France, an unrestricted restoration of Genevese liberty, by cancelling the treaty of guarantee between France and Switzerland, which prevented the republic from enacting new laws without the consent of the parties to this treaty. The proceedings and negociations to which this mission gave rise, necessarily brought Dumont into connection with most of the leading men in the Constituent Assembly, and made him an interested spectator, sometimes even a participator, indirectly, in the events of the French revolution. The same cause also led him to renew his acquaintance with Mirabeau, whom he found occupied with his duties as a deputy, and with the composition of his journal, the *Courrier de Provence*, in which he was assisted by Duroverai, Clavière, and other Genevese patriots. For a time Du-

mont took an active and very efficient part in the conduct of this journal, supplying it with reports as well as original articles, and also furnishing Mirabeau with speeches to be delivered or rather read in the assembly. This is now completely established by his highly instructive and interesting posthumous work entitled *Recollections of Mirabeau.* In fact, his friend George Wilson used to relate, that one day, when they were dining together at a table d'hôte at Versailles, he saw Dumont engaged in writing the most celebrated paragraph of Mirabeau's address to the king for the removal of the troops, which was believed to have been written by the orator himself. He also reported such of Mirabeau's speeches as he did not write, and, with a disinterested sacrifice of his own reputation to the diffusion of what he considered as truth, embellished and strengthened them from his own stores, which were inexhaustible. But this co-operation, so valuable for Mirabeau, and so self-devoted on the part of Dumont, was destined soon to come to an end; for, being attacked in pamphlets as one of Mirabeau's writers, he felt hurt at the notoriety thus given to his name in connection with a man occupying Mirabeau's peculiar position, and resolved to return to England, which he accordingly did in 1791. The reputation of being a subaltern writer was, as he himself states, by no means flattering; and the credit of an influential connection with a man whose character was far from being untainted alarmed his delicacy. He saw that he had no alternative but to put an end to a copartnership of which Mirabeau was certain to reap all the advantage, whilst the odium or discredit would alone fall to the lot of Mirabeau's associate; and he acted upon this conviction with a promptitude and decision worthy of his character.

In the eventful years which followed he continued to live chiefly at Lansdowne House, or at Bowood, where the most remarkable men of Europe as well as of Britain were frequent and welcome guests. Latterly, he began to form an intimate friendship with Lord Holland, whom he had known from childhood; and he became a member of the society of familiar friends, the habitual visitors at Holland House, who, during many years, saw a succession of celebrated guests of every country, party, religion, and of every liberal profession or station, which is likely to continue unmatched until another house be found that boasts such a master. "His mind was at that time in a most perfectly mature state, with much experience of very memorable events, and familiar intercourse with the most eminent men," besides an abundant store of amusing and striking anecdotes. "He had entirely subdued the popular and declamatory propensities which characterize youthful genius, yet without being in the least degree withdrawn from the love of letters and the delights of society by those scientific pursuits which occupied a subsequent period." In 1801 he travelled over various parts of Europe with Lord Henry Petty, now Marquis of Lansdowne, and brought back a fresher acquaintance with the mental occupations of the continental nations, from whom England had for years been separated by a wider and deeper channel than that formed by the hand of nature. But Dumont had then opened a new course of more serious occupations.

"In 1801 he published the *Traités de Législation;* the first fruits of his zealous labours to give order, clearness, and vivacity, to the profound and original meditations of Bentham, hitherto praised only by a very few patient readers, and but little better known, even by name, to the English than to the European public. The extraordinary merit of these writings, manuscript and printed, chiefly attracted his mind towards them; inferior circumstances, however, contributed their part to the fervour with which he devoted himself to them. Trained in the hasty and shallow philosophy which then reigned, metaphysical principles were a novelty, in the contemplation of which he was too agreeably employed to examine the solidity of the foundation on which they rested. Wearied with the common-places of philanthropic declamation, which passed for philosophy, he ran with eagerness into the opposite extreme of new terms, dry definitions, and simple principles. The method of Bentham is undoubtedly a powerful instrument for the discovery of truth, especially in the juridical part of moral science. It is, however, a method which may become more than mischievous, by the very circumstance of its apparent perfection.

"Supposing every other objection to that system to be answered, it will still be evident that the value of its application in every particular instance must be in proportion to the exactness and completeness with which every circumstance is enumerated that can affect the determination of the question. But the enumeration is not *complete,* merely because the names of all such circumstances are enumerated. It is not thus that the philosopher proceeds in those sciences where the success is uncontested. He calculates the *degree* of every force that acts on a body; he ascertains the *proportion* of every element which goes to make up a compound; and an error in either of these respects is, in truth and effect, a want of exact and complete enumeration, which may lead to the most false results. Such mistakes in the physical sciences are easily detected. In the moral sciences it is extremely easy *to seem* to form a complete theory by such general and vague inductions, because the means of quick and palpable detection are wanting. Wherever analysis is *really* exhaustive, it is the most perfect of instruments; but where it only reaches a semblance of exactness, it produces or perpetuates error in the exact proportion of its seeming approach to truth. There is no remedy against this dangerous distemper but the habit of never forgetting that, in each case, the main question always must be, 'How much of each enumerated cause is likely to act in the instance before me?' No show of accuracy, no superiority of method, can dispense with this question, or enable any man to answer it otherwise than by approximation. But with these high and arduous matters we must not deal more largely in this place. The talent with which M. Dumont performed his task is as generally acknowledged as the perfect disinterestedness which led him to employ so much talent in expounding the opinions and enlivening the reasoning of others. It is due to him to say, that he always considered the system as a model, to be always consulted and approached, but never imposed without a cautious regard to circumstances. It must also be observed, that however entirely he adopted the speculations, delighted in the method, and even acquiesced in the language of Bentham, that for which he really felt a warm zeal, and consecrated the labour of his life, was the practical establishment of that grand reformation of law, which owes indeed much to the writings of Bentham, and to the discussions which they daily contribute to spread and keep up, but which, so far from being peculiar to him, is zealously supported by those who dissent from his moral theories, and was common to him, at least in that more obvious part of it which relates to criminal law, with the philosophers of the eighteenth century, who pursued the same object, though with less distinctness of view, less precision of language, and less knowledge of the abuses to be reformed. The mind of Dumont moved onward with that of the reformers of jurisprudence throughout Europe. He does not needlessly question the singularities of his venerable master; but his attachment was to the main stock of reforming principle. Those who knew him need not be reminded, that if his principles have any

Dumont || Dumouriez.

tendency to a cold and low morality, they were in that respect altogether defeated by the nature of Dumont; a man of the utmost simplicity and frankness, of a most unusually affectionate and generous disposition."

In 1814 the restoration of Geneva to independence induced Dumont to return to his native place, and he soon became at once the leader and ornament of the supreme council. At the time of his death, he was on the eve of proposing a complete code of law by which he fondly hoped to make the legislation of Geneva an example to Europe. He died at Milan when on an autumn tour of relaxation in October 1829, in the seventy-first year of his age. (J.B—E.)

DUMONT, *Jean*, a well-known publicist, was born in France in the seventeenth century. He followed the profession of arms; but not obtaining promotion so rapidly as he expected, he quitted the service, and travelled through different parts of Europe. He stopped in Holland with the intention of there publishing an account of his travels. But in the interval, at the request of his bookseller, he wrote and published several pamphlets, which were eagerly sought after, by reason of the unceremonious manner in which he treated the ministry of France. This freedom having deprived him of all hope of employment in his own country, he now thought of forming a permanent establishment in that where he resided; and the knowledge which he had already acquired of the relations and interests of different nations having led him to entertain the idea of opening a course of lectures on public law, he lost no time in carrying it into effect. The project succeeded far beyond his expectations; and some useful compilations which he published about the same period made him favourably known in foreign countries. The emperor of Germany appointed him his historiographer, and some time afterwards conferred on him the title of Baron de Carlscroun. He died at Vienna in 1726, at an advanced age. Dumont wrote with facility, but his style is deficient in vigour and correctness; nevertheless, his works are esteemed as containing a great number of documents valuable for history.

The following is a list of the works published by Dumont: 1. *Nouveau Voyage au Lévant*, Hague, 1694, reprinted under the title of *Voyages en France, en Italie, en Allemagne, à Malte et en Turquie*, Hague, 1699, 4 vols. 12mo; 2. *Mémoires Politiques pour servir à la parfaite intelligence de l'Histoire de la Paix de Ryswick*, Hague, 1699, 4 vols. 12mo; 3. *Mémoires sur la Guerre présente* (1700), Hague, 1703, 12mo, reprinted under the title of *Recherches modestes des Causes de la présente Guerre, en ce qui concerne les Provinces Unies*, 1713, 12mo; 4. *Récueil de Traités d'alliance, de paix, et de commerce entre les Rois, Princes, et Etats, depuis la paix de Munster*, Amsterdam, 1710, 2 vols. 12mo; 5. *Soupirs de l'Europe à la vue du projet de paix contenu dans la harangue de la reine de la Grande-Bretagne*, 1712, 12mo; 6. *Corps Universel Diplomatique du Droit des Gens, contenant un Récueil des Traités de paix, d'alliance* etc. *faits en Europe, depuis Charlemagne jusqu'à présent*, Amsterdam, 1626, and following years, 8 vols. fol., continued after Dumont's death by J. Rousset; and 7. *Battailles gagnées par le Prince Eugène de Savoie*, Hague, 1723. To the *Corps Universel Diplomatique, du Droit des Gens* ought to be subjoined, 1. *L'Histoire des anciens Traités jusqu'à Charlemagne*, by Barbeyrac, 1739, in 2 vols. folio; 2. *Supplément au Corps Diplomatique, avec le cérémonial des Cours de l'Europe*, collected by Dumont, and arranged by Rousset, 1739, in 3 vols. fol.; 3. *Histoire des Traités de Paix du dix-septième Siècle*, by St Priest, 1725, in 4 vols. folio. Dumont was also the author of *Lettres Historiques contenant ce que se passe de plus important en Europe*, 12mo. This periodical, which was commenced in 1692, and two volumes of which appeared annually, Dumont conducted till 1710, from which time it was continued by Basnage, with the aid of several collaborateurs, until 1728. The earlier volumes are much esteemed. (J. B—E.)

DUMOURIEZ, CHARLES-FRANÇOIS, general of the French republican army, was born at Cambray in 1739 of a respectable family of Provence. His father was an intendant of the royal army, and had acquired some celebrity from an important publication on military affairs; and from him young Dumouriez received his earliest instructions. His studies were continued at the college of Louis-le-Grand for three years; but in 1757, his father having been attached to the army under d'Estrees about to invade Hanover, he accompanied him to Mauberge, and there, at nineteen years of age, made his first campaign as cornet in the regiment of Escart. In 1763 he attained the rank of captain; but in consequence of a reform reducing the numbers of the army he retired with a small pension, and the cross of St Louis. He afterwards received a subaltern situation in the secret missions.

Dumouriez.

On his return from a pedestrian tour in Italy, he addressed a memorial to the Duc de Choiseul, urging him to embrace the cause of the Corsicans against the Genoese; and in a public audience which he had with the minister on the subject, it led to a violent altercation, the result of which was a lettre de cachet which forced Dumouriez to leave France. But the expedition which he had advised being afterwards resolved on, Choiseul made him an honourable public reparation, and appointed him quartermaster-general of the troops.

The political conjunctures of the times offered an unlimited scope for the fertility of his diplomatic expedients. and he mingled in all the intrigues of the age. In 1770 he was sent on a secret mission to Poland with the view of neutralizing the efforts of Catherine II., and succeeded in securing fifty senators for the cause of independence, effected a unity of action among the confederates, and disciplined a militia; but when there was some appearance of the resurrection of Poland being effected, Choiseul fell under a cabal of the Duc d'Aiguillon and Madame Du Barry, and Dumouriez was recalled to Paris. He was soon, however, sent back on a similar mission by D'Aiguillon. He endeavoured to assist the revolutionists in Sweden, and to raise troops in the Hanse towns to menace Stockholm, but this was contrary to the views of the French cabinet; and the Duc d'Aiguillon, having discovered his project, had him arrested and thrown into the Bastile, where he was imprisoned six months, and then sent to the castle of Caen.

Disgusted with the dangerous career of intrigue, he now directed his attention to the improvement of his own country. He wrote a memoir on the great importance of the harbour of Cherbourg; and in the month of June 1786 he there met Louis XVI., who had come to assist at laying the first stone.

In 1788 Dumouriez was promoted to the rank of maréchal-de-camp, and pronounced in favour of political reform without breaking with the court. The connections which he held with the leading men of the Girondist party greatly advanced his political career. At the opening of the second legislative assembly he was appointed minister for foreign affairs in place of Delessart. This portfeuille, however, he only held for three months. During his short tenure of office he exerted himself to the utmost in reforming abuses, and in introducing the greatest economy into every department.

He held for one month the office of minister of war after the dismissal of his colleagues Roland, Servan, and Clavière. At length his own resignation followed, which increased his popularity. When the troops of the coalition advanced against France, he was appointed to the command of the army of the north as lieutenant-general under Marshal Luckner. (For the military operations which followed, see FRANCE.)

After the unsuccessful battle of Neerwinden in January 1793, being recalled by the Convention and threatened with the scaffold, he sought refuge in the camp of the Austrians, accompanied by the Duc de Chartres (afterwards Louis Philippe) and his brother.

Lost without hope of return to his native country, Dumouriez wandered a long time an exile in Brussels, England, Switzerland, Germany, Denmark, and Petersburg. At last he returned to England, where the government conferred on him a pension of L.1200 a-year. In 1814 and 1815 he endeavoured to procure from Louis XVIII. the baton of a marshal of France, but was refused.

After a long residence in England, where he enjoyed the hospitality and friendship of many distinguished men, he died at Turville Park on the 14th March 1823, in the eighty-fourth year of his age.

DUN, or BURGH, the name of an ancient species of building, of a circular form, common in the Orkney and Zetland Islands, the Hebrides, and the northern parts of Scotland. The latter term indicates the founders, who at the same time bestowed on them their native name of *borg*, a Sueo-Gothic word signifying a defence or castle; and the Highlanders universally apply to these places the Celtic name *dun*, signifying a hill—a term easily transferred to the tower itself by which a hill was usually defended. They are confined to the countries once subject to the crown of Norway. With few exceptions, they are built within sight of the sea, and several of them within sight of each other; so that, on a signal by fire, by flag, or by trumpet, they could give notice of approaching danger, and afford mutual support. In the Orkney and Zetland Islands they are most frequently called *wart* or *ward hills*, which shows that they were garrisoned. They had their wardmadher, or watchman, a sort of sentinel, who stood on the top, and challenged all who came in sight. The gackman was an officer of the same kind, who not only had to watch against surprise, but was also bound to give notice if he saw any ships in distress. He was allowed a large horn of generous liquor, which he had always by him, to keep up his spirits. Along the Orkney and Zetland shores they almost formed a chain, and by that means not only kept the natives in subjection, but were situated commodiously for covering the landing of their countrymen, who were perpetually roving on piratical expeditions. These towers were even made use of as state prisons; for we learn from Torfæus, that after Sueno had surprised Paul, count of Caithness, he carried him into Sutherland, and confined him there in a Norwegian tower. Out of this kingdom no buildings similar to these are to be found anywhere, except in Scandinavia. On the mountain of Swalberg in Norway is one; on the Stir-biskop, at Upsal, in Sweden, is another; and on Umsborg, in the same kingdom, is a third.

These towers vary in their inner structure, but externally they are universally the same, though some have an addition of strength on the outside. The burgh of Culswick, in Zetland, notwithstanding it is built on the top of a hill, is surrounded with a dry ditch 13 feet broad; that of Snaburgh, in Unst, has both a wet and a dry ditch, the first being cut with great labour through the solid rock. The burgh of Moura is surrounded by a wall, now reduced to a heap of stones, and the inside is cylindrical, not tapering, as is usual with others. The burgh of Hogster, upon an isle in a loch of the same name, has also the addition of a wall; a peculiarity in a causeway to join it to the mainland, and a singular internal structure. Numbers of little burghs, with single cells, are scattered about in the neighbourhood of the greater, and were probably built by the poorer sort of people, in order to enjoy their protection. A multitude of places in these islands have the addition of burgh to their names, notwithstanding there is not a vestige of a tower near them, the materials having long since been carried away and applied to various uses.

DUNA, or southern DWINA, a river of Russia. See RUSSIA.

DUNABURG, a strongly fortified town of Russian Poland, capital of a cognominal circle in the government of Vitebsk, on the right bank of the Düna, 60 miles W.N.W. of Drissa. It has some trade, and 6000 inhabitants.

DUNBAR, a royal and parliamentary burgh, and seaport of Scotland, county of Haddington, situated on an eminence, near the mouth of the Firth of Forth. It consists of one wide main street, with several other streets and lanes which diverge from it. Dunbar is a place of great antiquity. It originated in a castle, once of great strength and importance as a bulwark against English invasion. The site of the fortress was well chosen both for defence and convenience. The coast is here bold, and studded with rocky islets. The rocks on the shore in early times afforded room for the battlemented walls of a fort, which gradually increased by connection with the adjoining land, and with the islets by walls of great strength. It was thus admirably adapted to receive succour by sea, or to favour the escape of its defenders. We find it mentioned as early as 856; and subsequently it stands conspicuously prominent in the various conflicts in which Scotland was engaged. It endured several memorable sieges, the most remarkable of which was that by the English in 1337, when it was defended by Black Agnes countess of March and a member of the Douglas family. Montague the English commander had constructed a machine called a sow (resembling the Roman pluteus), with which he began to undermine the walls. The countess, discharging a great stone from the rampart, destroyed this machine, calling out at the same time,

> "Marry, Montagow,
> For farrow shall thy sow."

The castle is now a total ruin. The harbour and quay of Dunbar are on a confined plan, and the usual depth of water is scarcely sufficient to float vessels of 300 tons burden. The main evil of the port arises from the existence of various craggy islets and sunken rocks near the entrance, which render the navigation somewhat dangerous. Market-day Tuesday. Dunbar is chiefly famous for its herring fishery, which is extensively carried on. There are in the town a soap-work, and several iron foundries, breweries, and distilleries. Ship-building is also carried on to a small extent. The most remarkable house in Dunbar, a large plain mansion, facing the west end of the main street, is the property, and was formerly the residence of the family of Lauderdale; but it is now in a neglected condition. At the entrance to the town from the west there are remains of an ancient monastery of Greyfriars, founded in 1218. In 1819 a handsome new Gothic church was erected upon the site of a previous one, founded in the fourteenth century. There are also two United Presbyterian chapels, a Free church, and a Methodist chapel. There are two public schools, several private seminaries, a mechanics' institute, and a subscription library. There are also several charitable institutions. The town is governed by a provost, three bailies, a treasurer, town-clerk, and chamberlain, with 15 councillors. The annual revenue of the burgh is about L.1700. It was created a royal burgh by David II., and unites with Haddington, Jedburgh, Lauder, and North Berwick, in returning a member to parliament. Pop. (1851), 3038. Dunbar is a station on the North British railway, 29½ miles E.N.E. from Edinburgh.

DUNBAR, *William*, the most eminent of all the early Scottish poets, appears to have been born about the middle of the fifteenth century. Notwithstanding the high reputation which he enjoyed among his contemporaries, the records of his personal history and character are extremely scanty; and although he belonged to the church, his progress is not to be traced by successive preferments. He describes himself as a native of Lothian. Kennedy represents him as related to the earl of March; but this perhaps is only to be considered as a poetical fiction, introduced for the purpose of heightening his invective. His latest biographer, however, supposes that he may have been the grandson of Sir Patrick Dunbar of Beill in the county of Haddington, a younger son of George the tenth earl of March. "This Sir Patrick," we are informed, "signalized himself on many occasions, and was one of the hostages for James the First in 1426; and it also appears from an original charter, dated 10th August 1440, that one of his sons was named William, who in all probability was either

the father or uncle of the poet. No other person of the same baptismal name can be traced during the whole of that century; and as such names generally run in families, the circumstance of our author's alleged descent from the earls of March, in connection with his own avowal respecting his birth-place, adds some strength to the conjecture of his being the grandson of Sir Patrick Dunbar of Beill."[1] During the present age, the births, marriages, and deaths of persons possessing little property and less distinction may in a great variety of instances be very easily traced; but as the same diurnal records did not exist in the fifteenth century, it is only where names are connected with property, rank, or office, that in most cases we can succeed in an attempt to discover the outlines of private or domestic history. Neither the name nor the surname was uncommon: at that period Scotland certainly contained many Williams and many Dunbars; and if numerous instances of this combination of name and surname have not been detected, it is not difficult to assign a reason.

In the year 1477, William Dunbar of St Salvator's College took the degree of A. B. in the university of St Andrews; and as the statutes required the candidate to be of three years standing, he must have been matriculated in 1474. In 1479 he took the degree of A. M.[2] Whether this was the poet, or another individual of the same name, we have no means of ascertaining: but there is an apparent coincidence in the time; and the supposition that he studied at St Andrews, is highly probable in itself. There is likewise some reason to suppose that he studied in the university of Oxford: "Quod Dunbar at Oxenfurde," is the colophon of one of his poems; and we need scarcely remark that Oxenford was once the current name of this seat of the Muses. But it is also to be recollected that the poet might visit Oxford in some other capacity than that of a student. In his youth he appears to have been a novice of the order of St Francis. His sentiments with regard to this profession we are enabled to glean from one of his poems; and those sentiments we shall here endeavour to exhibit in plain prose. "Before the dawn of day," says Dunbar, "methought St Francis appeared to me with a religious habit in his hand, and said, go, my servant, clothe thee in these vestments, and renounce the world. But at the sight of him and his habit I was scared like one who sees a ghost. And why art thou terrified at the sight of the holy weed? St Francis, reverence attend thee, and thanks for this intended benefit; but with regard to those garments of which thou art so liberal, it has never entered into my mind to wear them: sweet confessor, take it not in evil part. In holy legends have I heard it alleged that bishops are more frequently canonized than friars; if therefore thou wouldst guide my soul towards heaven, invest me with the robes of a bishop. Had it ever been my fortune to become a friar, the season is now long past: between Berwick and Calais, in every flourishing town of the English dominions, have I made good cheer in the habit of thy order; in friar's weeds have I mounted the pulpit at Dernton and Canterbury, in them have I also crossed the sea at Dover, and instructed the inhabitants of Picardy; but this mode of life compelled me to have recourse to many a pious fraud, from the guilt of which no holy water could cleanse me. What had thus appeared to me as St Francis, was a fiend in the likeness of a friar: he vanished away with stench and fiery smoke; methought he carried one end of the house along with him, and I awoke like a wight in perplexity."[3]

From this and some other passages of his works, it is evident that Dunbar had in some degree imbibed the spirit of a reformer; and it is obvious that in all countries which have in any measure been extricated from the superstitions and delusions of the Romish church, the poets have contributed to prepare the way for the theologians. Wit and satire, when thus directed, are formidable weapons, and although ridicule is no test of truth, it has often been found a powerful instrument for exposing inveterate error The best arguments may be employed in vain, and force commonly interposes in behalf of established opinions but poets have in all ages claimed and exercised considerable freedom of animadversion; and, as light troops are sometimes more serviceable than the heavy-armed soldiery, the gay satirist is sometimes more successful in his attacks than the learned controversialist. Another inference to be drawn from this poem is equally obvious: as the author had preached in England and France, he must have been familiarly acquainted with the languages of both countries; or, if we suppose him to have preached at Canterbury in his native tongue, we must at least conclude that he spoke French when he instructed the inhabitants of Picardy. His travels are likewise mentioned in Kennedy's Flyting, where we must however make some allowance for satirical exaggeration.

Fra Atrik Forrest furth ward to Drumfreiss
 Thow beggit with ane pardoun in all kirkis,
Collapis, crudis, meill, grottis, gryce, and geiss,
 And undir nycht quhylis thow stall staigis and stirkis.
 Becauss that Scotland of thy begging irkis,
Thow schaipis in France to be a knycht of the feild;
Thow hes thy clamschellis, and thy burdoun keild,
 Unhonest wayis all, wolroun, that thow wirkis.[4]

Dunbar, in one of his invectives against Kennedy, has furnished us with some further information respecting his own adventures.

Or thow durst move thy mynd malitius,
 Thow saw the saill abone my heid updraw;
But Eolus full woid and Neptunus,
 Mirk and moneless, wes met with wind and waw,
 And mony hundreth myle hyne cowd us blaw
By Holland, Seland, Zetland, and Northway coist,
 In desert [place] quhair we wer famist aw;
Yit come I hame, fals baird, to lay thy boist.

After the period of his travelling noviciate, Dunbar appears in the character of a court poet, and of a candidate for preferment in the church. On one occasion he speaks of his dancing "in the quenis chalmer."

Than cam in Dunbar the makkar,
On all the flure thair was nane frakkar,
And thair he daunsit the Dirrye dantoun;
He hoppet lyk a fillie wantoun,
 For luiff of Musgraiffe, men tellis me;
He trippet quhill he tint his pantoun:
 A mirrear dance mycht na man see.

Than cam in Maistriss Musgraiffe;
Scho mycht haiff lernit all the laiffe.
Quhen I saw hir sa trimlye dance,
Hir guid convoy and countenance,
 Than, for hir saik, I wissit to be
The grytast erle or duik in France:
 A mirrear dance mycht na man see.

But neither his dancing nor his solicitations seem to have procured him any considerable preferment. From the strain of his earlier compositions, it is evident that his first hopes were sufficiently sanguine, and from that of his

[3] Dunbar's Poems, vol. i. p. 28.
[4] Ibid. vol. ii. p. 81.

later compositions, that those hopes had been completely frustrated. "Why shouldst thou," says the desponding poet, "be induced to hope for preferment, when an Italian impostor finds means to thrust himself into the chair of an abbot? How the affairs of the church are managed, I know not; but assuredly its benefices are not distributed with an impartial hand. While some enjoy seven, I am not possessed of one; and some, unworthy as they are to fill a stall, would fain climb to the rank of cardinal, a bishopric being too mean an object for their ambition." He addressed some stanzas to the king when many benefices were vacant; he frequently renewed his petition, and frequently complained that his life was suffered to wear away in fruitless expectation. From the wish which he expresses "To the King, that he war Johne Thomsounis Man," it may be inferred that Queen Margaret was anxious to promote his interest: the tenor of his prayer is, that the king were more subservient to the wishes of his consort.

> My advocat, bayth fair and sweit,
> The hale rejosing of my spreit,
> Wald speid in to my errandis than,
> And ye war anis Johne Thomsounis man.

Whether Dunbar's advancement was in any degree retarded by his own imprudence, can only be conjectured. The clergy of that age do not appear to have been generally promoted for their piety or learning; and so very moderate was the ordinary standard of external decency, that it must only have been the most gross and flagrant profligacy that could operate as a disqualification for preferment. It must however be acknowledged that some of his strains are highly reprehensible: his compositions are occasionally tinctured with expressions which we cannot but regard as grossly indecent and profane; one of his addresses to the queen is such as might offend a modern courtezan; the more solemn observances of the church he has converted into topics of ridicule; the litanies are burlesqued in a parody which is not easily to be paralleled for its profanity. But it is more than probable that such indecent levities excited little or no disgust in his contemporaries: the age was not distinguished by any uncommon share of piety, nor had it attained to that degree of refinement which frequently secures a certain ostensible decorum, a decent appearance of virtue, where virtue itself is not to be found. To whatever cause his failure may be attributed, there is reason to suspect that he never obtained a benefice. But we learn from the public records that he was indebted to the king for a regular pension, as well as for occasional grants of money. The register of the privy seal, 15th August 1500, mentions a yearly pension of ten pounds, payable at Whitsuntide and Martinmas, to "Maister William Dunbar for all the dayis of his life," or until he should be promoted by the king to a benefice of the yearly value of forty pounds or upwards. It appears from the treasurer's accounts that the payment due at Martinmas 1501, was deferred on account of his being then in England; and it has been considered as "probable that he accompanied the ambassadors who were sent to England to conclude the negociations for the king's marriage in October 1501; and that he remained to witness the ceremony of affiancing the princess Margaret, which took place at St Paul's cross, with great solemnity and splendour, on the 25th of January 1502. Under this supposition, we can have little hesitation in believing that Dunbar was the person then styled *the Rhymer of Scotland*, who received L.6. 13s. 4d. in reward from Henry VII. on the 31st of December 1501, and a similar sum on the 7th of January following."[1] He speaks of his long and faithful services to the king, and of his having been employed in many foreign countries, in England, Ireland, France, Spain, Italy, and Germany. Mr Laing conjectures, perhaps with sufficient probability, that in these extensive peregrinations he was attached to diplomatic missions, in which his knowledge of Latin and French might be available to persons of higher rank and inferior learning.

On the 17th of March 1504, or, according to our present computation, 1505, Dunbar for the first time said mass in the king's presence; and on that occasion he received a gratuity of seven French crowns, which was a larger sum than the king usually allotted for a priest's first mass. At the term of Martinmas 1507 his pension was encreased to twenty pounds; and on the 26th of August 1510 it was encreased to eighty pounds, to be paid during his life, or until he should be promoted to a benefice of the yearly value of one hundred pounds or upwards. How long he enjoyed this pension, and whether he ever exchanged it for a benefice, no research has yet ascertained.[2] On the 9th of September 1513 the king perished at Floddon-field; and there may be some reason to apprehend that his interest was not unaffected by that fatal event. From one of his poems, written "quhen the Governour past into France," it is evident that he must have survived for several years. John duke of Albany, regent of the kingdom, sailed for France in June 1517, again in October 1522, and finally in May 1524; nor can we safely decide to which of those three voyages the poet refers. It is at least certain that he was dead in the year 1530, when Sir David Lindsay composed his Complaynt of the Papingo.[3] He describes himself as having attained to an advanced age; nor does he appear to have been so unwise as to continue his levities to the utmost verge of life; several of his poems are written in a moral and religious strain, not unbecoming an aged priest.

The poems of Dunbar are numerous and miscellaneous, but none of them extends to any considerable length. He evidently unites a brilliant imagination with an elegant taste; nor is he less conspicuous for his skill in the mechanical part of poetry. The elasticity of his mind and the versatility of his talents enabled him to arrive at eminence in different departments of composition: his allegorical poems display a rich and fertile invention; and he is equally distinguished for his powers of description and satirical humour. His diction is often remarkable for its terseness and forcible simplicity; but it is not always free from the vicious and pedantic phraseology with which the English poetry of that period is so deeply infected. Dr Nott observes that Dunbar, "a poet of a rich and lively fancy, and possessing great natural command of language," was nevertheless induced to use such pedantic diction as occurs in the opening of his beautiful moral

---

[1] Laing's Memoirs of Dunbar, p. 20.

[2] "The treasurer's accounts from the 8th of August 1513 (a month previous to the battle of Floddon) to the 25th of January 1515, which might have thrown some light on the subject, have not been preserved; and in those from that date to the 4th of September 1518 (from which time to the 5th of June 1522 there is another blank in the series) there is no mention of Dunbar's name. We cannot therefore discover the date of the last payment of his pension; but although we now lose all trace of his name, it by no means follows that his pension was entirely withdrawn: it might either have been transferred to some other branch of the royal revenue, or the poet might at last have been promoted to a benefice, when consequently his pension would cease." (Laing's Memoirs of Dunbar, p. 34.) The treasurer's accounts, 1st April 1513, mention a payment to Dunbar of so small a sum as forty-two shillings.

[3] Lindsay's Works, vol. i. p. 285.

poem, entitled the Goldyn Targe.[1] He has employed a great variety of measures; and his versification, when compared with that of his most eminent contemporaries in both kingdoms, will in general appear highly ornamented and poetical.

Mr Ellis, after having quoted three of his shorter poems, subjoins the following remarks: "In these specimens we see much good sense and sound morality, expressed with force and conciseness. This indeed is Dunbar's peculiar excellence. His style, whether grave or humorous, whether simple or ornamented, is always energetic; and though all his compositions cannot be expected to possess equal merit, we seldom find in them a weak or redundant stanza."[2] The accomplished historian of English poetry likewise mentions him with no faint approbation. "I am of opinion," says Mr Warton, "that the imagination of Dunbar is not less suited to satirical than to sublime allegory; and that he is the first poet who has appeared with any degree of spirit in this way since Pierce Plowman. His Thistle and Rose and Golden Terge are generally and justly mentioned as his capital works: but the natural complexion of his genius is of the moral and didactic cast."[3] But, subjoins Mr Pinkerton, "this remark must not be taken too strictly. The Goldin Terge is moral, and so are many of his small pieces; but humour, description, allegory, great poetical genius, and a vast wealth of words, all unite to form the complexion of Dunbar's poetry. He unites in himself, and generally surpasses, the qualities of the chief old English poets; the morals and satire of Langland, Chaucer's humour, poetry, and knowledge of life, the allegory of Gower, the description of Lydgate."[4]

But the most striking proofs of his genius are certainly to be found in his two allegorical poems. The Thrissill and the Rois was composed in celebration of the nuptials of James the Fourth and Margaret Tudor; an event productive of very important consequences to both kingdoms, inasmuch as it ultimately led to that happy union which the nature of the territory and the kindred origin of the people rendered so suitable and so desirable. In the plan of this poem Dunbar displays boldness of invention and beauty of arrangement; and some particular passages are remarkable for their strength and even beauty of colouring. The Goldyn Targe, which is written in a different stanza, is another allegorical poem of nearly equal merit. The golden targe, or the shield of reason, is found an insufficient protection against the assaults of the train of love.

Some of his short poems, of a serious character, are likewise to be distinguished from the ordinary compositions of that period. The stanzas bearing the title of Learning vain without guid Lyfe possess superior merit as a moral descant. His Meditatioun in Wyntir is also to be classed among the best of his serious pieces: some of the stanzas are beautiful and pathetic; and they may all be perused with more than common interest as the solitary musings of neglected genius.

Nor are his satirical less remarkable than his serious productions. His poem entitled the Dance of the sevin Deidly Synnis presents many admirable strokes of comic and grotesque description. On the eve of Lent, the poet falls into a trance, and is presented with a glimpse of heaven and hell. Mahoun, or the devil, proclaims a dance of those wretches who have died without absolution; he commands them to prepare a mummery, and to "kast up gamountis" according to the newest French fashion. The seven Deadly Sins immediately present themselves, and are each accompanied by a select band of votaries. Pride is with evident propriety represented as leading the dance, and is dressed in the first fashion of that period: his hair is thrown back, his bonnet is placed on one side of the head, and his gown flows to his heels in ample folds.

Lat se, quoth he, now quha begynnis:
With that the fowll sevin Deidly Synnis
  Begowth to leip at anis.
And first of all in dance was Pryd,
With hair wyld back, and bonet on syd,
  Lyk to mak vaistie wanis;
And round abowt him, as a quheill,
Hang all in rumpillis to the heill
  His kethat for the nanis.
Mony prowd trumpour with him trippit;
Throw skaldand fyre ay as thay skippit,
  Thay gyrnd with hyddouss granis.

This group is succeeded by holy harlots; but Mahoun and the other fiends are not much entertained till a company of priests present their shaven crowns.

Heilie harlottis on hawtane wyiss
Come in with mony sindrie gyiss,
  Bot yit luche nevir Mahoun,
Quhill priestis come in with bair schevin nekkis:
Than all the feyndis lewche and maid gekkis,
  Black-belly and Bawsy-Broun.

Anger, who next makes his appearance, is very forcibly described in a single distich.

Than Yre come in with sturt and stryfe,
His hand wes ay upoun his knyfe.

He is attended by a band of ruffians, who follow in pairs, all equipped for war; and, as they move along, they frequently wound each other with swords and knives. The train of Anger is followed by that of Envy. He is attended by many a dissembler, flatterer, and back-biter, with "rownaris of fals lesingis," or whisperers of lies; from whom the poet cannot avoid expressing his regret that the courts of princes are never free. The next prominent figure in the dance is Covetousness, who is accompanied by catives, wretches, usurers, and hoarders of wealth. From their throats they discharge at each other torrents of molten gold; and when this ammunition is exhausted, the fiends replenish them with the same metal.

Nixt him in dans come Cuvatyce,
Rute of all evill, and grund of vyce,
  That nevir cowd be content:
Catyvis, wrechis, and ockeraris,
Hud-pykis, hurdaris, and gadderaris,
  All with that warlo went.
Out of thair throttis thay schot on udder
Hett moltin gold me thocht a fudder,
  As fyre-flawcht maist fervent;
Ay as thay tumit thame of schot,
Feyndis fild thame new up to the thrott
  With gold of allkin prent.

Sloth, after being twice called, joins unwillingly in the dance, attended by many suitable companions. He drags

[4] Pinkerton's List of the Scotish Poets, p. xciv.—"It is evident," says Dr Drake, "that a union of talents of this wide range must necessarily be of rare occurrence; nor can we wonder that a century should elapse before a poet in any high degree approaching the genius of Chaucer made his appearance in our island. Not indeed until Dunbar arose in the sister kingdom, had we another instance of the combination of first-rate abilities for humour and comic painting, with an equally powerful command over the higher regions of fiction and imagination." (Mornings in Spring, vol. ii. p. 4. Lond. 1828, 2 vols. 8vo.)

them along with a chain, and Belial lashes them on the loins; but their motion is nevertheless so tardy, that they are occasionally roused by being scorched in fire. The succeeding group consists of Lust and his loathsome train; he snorts like a stallion, is led by Idleness, and is attended by many foul associates who have died in their sins. When they engage in the dance, their visages become as red as the turkis stone. The foul monster Gluttony next presents himself, followed by many a drunkard and prodigal. When they become clamorous for drink, the fiends drench them with melted lead. All these terrific exhibitions might have been expected to satisfy Mahoun himself; but he is nevertheless pleased to close the entertainment with a Highland pageant.

> Than cryd Mahoun for a Heleand padyane,
> Syne ran a feynd to feche Makfadyane,
> Far northwart in a nuke:
> Be he the correnoch had done schout,
> Ersche men so gadderit him abowt,
> In hell grit roume thay tuke.
> Thae tarmegantis, with tag and tatter,
> Full lowd in Ersche begowth to clatter,
> And rowp lyk revin and ruke.
> The devill sa devit wes with thair yell,
> That in the depest pot of hell
> He smorit thame with smuke.

Dunbar's tale of "The twa maryit Wemen and the Wedo" presents us with the only specimen of blank verse which the ancient Scottish language affords. The rhythm is of that species which the author of Piers Plowman, or some of his predecessors, borrowed from the Anglo-Saxon poets, and which appears to have derived its origin from a remote era. It was employed by the Islandic as well as by the Anglo-Saxon poets, and was constructed with some degree of nicety.[1] Their lines are generally short, and they do not rigorously confine themselves to a definite number of syllables. Here alliteration supplies the place of rhyme; the corresponding sounds are at the commencement, not at the termination of words. In two contiguous and connected lines there must be three words beginning with the same letter; and, according to the strictest rule, two of those words ought to occur in the first, and the other ought to begin the second line. It was on such a model that Dunbar and the author of Piers Plowman constructed their verses, though they have not observed all the niceties of their predecessors. In the editions, and indeed in the manuscripts of their respective poems, what is exhibited as a single verse is in reality a distich, and admits of a division without any degree of violence.

This work of Dunbar presents us with a lively though indelicate picture of ancient manners, and is a very curious relique of ancient poetry. Bishop Percy considers it as equal to one of the most humorous productions of Chaucer. The peculiarity of the versification has compelled the author to adopt many uncouth terms; and accordingly the language of this tale is more difficult to be understood, and appears more obsolete, than that of his other poems; but his shrewdness of remark and strength of description shine through the mist of obscure phraseology in which they are sometimes involved. Soon after midnight in a morning of June, the poet walks by a goodly garden, and, on hearing the sound of voices, is induced to look through the lofty hedge, when he perceives three ladies seated in a green arbour, and regaling themselves with wine: he secretly listens to their conversation, of which he professes to give a faithful report. As the wine circulates, they become more communicative, and, at the suggestion of the widow, they successively detail their experience of a married life. The sentiments which they utter, are as profligate as can well be imagined; and it is to be hoped that Dunbar did not intend this as a general representation of the ladies of his own age and nation.

Two of his satirical poems relate to a certain Italian, named John Damian, on whom James the Fourth had bestowed the abbacy of Tungland in Galloway. This adventurer appears to have been an empiric and an impostor, and to have persuaded the king that he had discovered the secret of converting baser metals into gold; nor is it surprising that Dunbar should feel some degree of indignation on seeing high preferment bestowed upon such a person. The abbot having failed to produce the promised gold, made a still more desperate attempt to maintain his reputation as an adept in science and art: he provided himself with a pair of wings, and appointed a particular day for taking his flight from the walls of Stirling castle; when the day arrived, he indeed plunged from the rampart, but instead of mounting in the air, he fell to the ground, and broke his thigh-bone. These anecdotes do not rest on the authority of a satirical poet, for this must commonly be regarded as a very dubious authority; but they are circumstantially related by Bishop Lesley in his history of that reign;[2] and the one account may so far be considered as a confirmation of the other, although the poet has added many particulars of ludicrous exaggeration. Thus, according to Dunbar's dream, he slew a friar in Lombardy, in order to obtain possession of his habit; and having fled to France, he began to practise physic, and in this way committed many new murders. The course of his adventures at length conducted him to Scotland, where he followed his leechcraft with similar success. When raised to the dignity of a prelate, he was not to be seen at mass; he did not appear at matins in his stole and scarf, but was generally to be found in his laboratory, as sooty as a blacksmith.

> In lechecraft he was homocide;
> He wald haf for a nycht to byd,
> Ane haknay and the hurt mannis hyd,
> So mekle he was of myans.
> His irnis was rude as ony rauchtir,
> Quhar he leit blude it was no lauchtir,[3]
> Full mony instrumentis for slauchtir
> Was in his gardyvians.
>
> He couth gif cure of laxatif,
> To gar a wicht horse want his lyf;
> Quha evir assay wald, man or wyf,
> Thar hippis yeid hiddy-giddy.
> His praktikis nevir war put to preif
> Bot sudand deid, or gret mischeif;
> He had purgacioun to mak a theif
> To de without a wedye.

---

[3] "Lors que mon frere fut en Escosse, il n'y avoit qu'un medecin, qui estoit medecin de la reyne, et de mon temps en Angleterre, il n'y avoit gueres de medecins. En Escosse un menuisier saignoit, et il y avoit des barbiers qui tondoient seulement." (Scaligerana, p. 223.)

Unto no mess preissit the prelat,
For sound of sacrying bell nor skellat;
As blak smyth brukit was his pellat,
For battiring at the study.
Thocht he come hame a newe maid channoun,
He had dispensit with matinnis cannoun;
On him come nothir stole nor fannoun,
For smwking of the smedye.

His unfortunate flight is afterwards related in a very ludicrous manner. The abbot of Tungland has furnished Dunbar with the subject of another poetical dream, which contains one passage remarkable for the strength of its satirical conception.

He sall ascend as ane horrible griphoun,
Him meit sall in the air ane scho dragoun;
Thir terrible monsteris sall togidder thrist,
And in the cludis gett the Antechrist,
Quhill all the air infeck of thair puysoun.

Many of the comic and satirical compositions of Dunbar are valuable memorials of ancient manners; and, if incapable of gratifying the reader of taste, they are at least objects of curiosity to the antiquary. Of this description are the stanzas entitled the Devill's Inquest; which strongly evince that our ancestors were grossly addicted to profane swearing. "It might," as Dr Ogden remarks, "puzzle a philosopher to trace the *love of swearing* to its original principle, and assign its place in the constitution of man." This vice is now regarded as a characteristic of the vulgar, of those who are truly vulgar in their habits and associations, whatever may be their external circumstances; but during the age of Dunbar, it seems to have been practised by all ranks and denominations. To swear like a Scot, was once a proverbial expression.[1] In this general muster of swearers, the priest takes precedence.

Me thocht as he went throw the way,
Ane priest sweirit braid, be God verey,
Quhilk at the alter ressavit he.
Thou art my clerk, the devill can say,
Renunce thy God, and cum to me.

Bishop Douglas, who certainly did not fall below the common standard of clerical decorum, has not scrupled to bedeck his compositions with abundance of oaths. The vice of profane swearing at length arrived at so scandalous a height as to require the interference of the legislature, and it was found necessary to extend the penalties to the clergy as well as the laity: by an act of Q. Mary in 1551, a "prelate of kirk," earl, or lord, was to be fined in twelve pence for the first offence committed within the next three months; different penalties were apportioned to different ranks during the first year; and for the fourth offence committed after the expiration of that period, a prelate, earl, or lord was to be banished or imprisoned for the space of a year and a day.[2]

Dunbar has left some examples of a motley species of composition, which at that period was not uncommon, and in which shreds of different languages are fantastically combined. It does not strictly come under the denomination of macaronic poetry, in which Latin are mingled with vernacular words of Latin terminations, and in which the rules of prosody are observed with at least some degree of care.[3] The earliest macaronic poet is sometimes supposed to have been Teofilo Folengo, a Benedictine monk, better known by the name of Merlinus Cocaius, who was born near Mantua in the year 1491.[4] Of his Macaronics the first edition bears the date of 1518; but during the preceding century a work had appeared under the title of "Typhis Odaxii Patavini Carmen Macaronicum de Patavinis quibusdam Arte magica delusis."[5] This model was followed by Folengo, and by Antonius Arena, or Antoine du Sablon, a French lawyer; and these two are the most celebrated poets of this fantastic school. Among the Scottish poets they have found a few imitators, particularly Drummond and Dr Geddes. Dunbar has not adhered to the same model; without regarding the rules of prosody, he intermingles Latin with Scottish lines, and produces an effect sufficiently ludicrous. Of this particular mode of composition, much earlier specimens are to be found; and Dante himself has written a *canzone* which

[1] "I have never been able to discover," says Lord Hailes, "from what cause our ancestors became so monstrously addicted to profane swearing. I remember Tom Brown some where uses, 'swear like a Scotsman,' as a proverbial expression. There certainly must be a tradition on the continent, that the inhabitants of the whole island were apt to swear in common conversation; for in Holland, the children, when they see any British people, say, 'there come the G— dams;' and the Portuguese, when they acquire a smattering of English, say, 'How do you do Jack, G— damn you?'—Queen Elizabeth was a common swearer." (Notes on Ancient Scottish Poems, p. 241.) Of the truth of one of these remarks we find a curious confirmation in the collection of Norman *chansons* subjoined to the "Vaux-de-Vire d'Olivier Basselin." Caen, 1821, 8vo.

Mauldicte en soyt trestoute la lignye!
Ils ont chargé l'artellerye sus mer,
Force bisquit et chascun ung bydon,
Et par la mer jusq' en Bisquaye aller
Pour couronner leur petit roy *Godon.*

Their little king *G— damn* was Henry the Sixth, who succeeded his father at a very tender age. The subsequent passage occurs in the works of Cretin, a Norman poet who wrote about the beginning of the sixteenth century. (Les Poesies de Guillaume Cretin, p. 168. Paris, 1723, 8vo.)

Cryant qui vive aux *Godons* d'Angleterre.

[2] Acts of the Parliaments of Scotland, vol. ii. p. 485. See likewise p. 482.

[3] Dr Good has made the following remarks in reference to the English translators of Blainville's Travels through Italy: "When they tell us that macaronic poetry, which is a mixture of Italian and Latin words, possessing a Latin termination, 'is so called from its being supposed to resemble (as being a mixture) the Italian maccheroni, these being composed of flour, cheese, and butter'—they display a woeful ignorance of the subject they attempt to elucidate. Maccherone is a term in the Italian language, significative of a blockhead, an ignoramus, or in equivalent English a *pudding-pated* fellow: and Maccheronéa (Macaronics) are obviously, therefore, burlesque imitations of the unclassical style of such writers." (Memoirs of the Rev. Alexander Geddes, LL. D. p. 256. Lond. 1803, 8vo.) The style of blockheads must generally be unclassical; but the origin of the term macaronic, as applied to this motley species of composition, is nevertheless very truly explained by the translators. For this explanation we have the authority of Folengo himself, who in the *Apologetica* prefixed to his *Opus Macaronicorum* speaks in the following manner: "Ars ista poetica nuncupatur ars macaronica, a macaronibus derivata, qui macarones sunt quoddam pulmentum, farina, caseo, botiro compaginatum, grossum, rude, et rusticanum; ideo macaronice nil nisi grassedinem, ruditatem, et vocabulazzos debet in se continere." See likewise Menage's Origini della Lingua Italiana, p. 301.

Dunbar.

contains a mixture of three languages, Latin, Romance, and Italian. It concludes with the following lines:

Chanson, vos pogues ir per tot le mond;
Namque locutus sum in lingua trina,
Ut gravis mea spina
Si saccia per lo mondo, ogn' uomo il senta:
Forse pietà n' avrà chi mi tormenta.[1]

Skelton, the contemporary of Dunbar, has occasionally indulged in this vein of humour; and a poem of the same description occurs among the works of Dr Arbuthnot, though it has likewise been attributed to Meston. The following stanza, which forms the conclusion of Dunbar's Testament of Kennedy, may be considered as a sufficient specimen.

I will na priestis for me sing
Dies illa, dies iræ,[2]
Na yit na bellis for me ring,
Sicut semper solet fieri;
Bot a bag-pipe to play a spryng,
Et unum ail wosp ante me;
In stayd of baneris for to bring
Quatuor lagenas cervisiæ,
Within the graif to set sic thing
In modum crucis juxta me,
To fle the feyndis, than hardely sing
De terra plasmasti me.

The Flyting of Dunbar and Kennedy is an extraordinary effort of unrefined wit; and is at least sufficient to evince that the ancient Scotish tongue was not deficient in terms of abuse.[3] Lord Hailes is inclined to believe that this altercation may have been a mere play of illiberal fancy, without any real quarrel between the antagonists; and this opinion he supposes to be confirmed by the affectionate manner in which Dunbar afterwards speaks of Kennedy, and of Quintin Shaw, who in this literary duel seems to have acted the part of Kennedy's second. A similar altercation was maintained by Luigi Pulci and Matteo Franco: although for the amusement of their readers they loaded each other with the grossest abuse, yet the intimacy of their friendship is said to have continued without interruption.[4] The example of Dunbar and Kennedy was followed by James the Fifth and Sir David Lindsay, and at a later period by Montgomery and Hume. It is not to be imagined that a king and one of his courtiers were engaged in actual hostilities; and in the verses prefixed to the "Flyting betwixt Montgomery and Polwart," it is expressly stated that their altercation was not the result of a real quarrel, but of what is there described as generous emulation.

A comic tale, entitled the Freiris of Berwik, and possessing a large fund of genuine humour, seems to have been composed about the period to which our attention is now directed. Mr Pinkerton supposes it to have been written by Dunbar; but this opinion is founded on no historical evidence, nor can the internal evidence of style and manner be considered as very striking or satisfactory. "But this tale," he remarks, "cannot at any rate be above thirteen years later than Dunbar, who must have died about 1525. In 1482, Berwick was wrested from Scotland, and was ever after in the possession of the English. Now this poem speaks of all the monasteries as actually standing and flourishing while it was written; and it is well known that in 1535 Henry VIII. suppressed the lesser monasteries, and in 1539 the greater. It follows that this tale must, at all events, have been written before 1539."[5] But the poet, whoever he may have been, does not speak of the monasteries of Berwick as actually flourishing; he merely avers, that when the adventures took place, friars of the different orders were not to seek, but were dwelling in the town. It is therefore evident that this chronological argument is by no means satisfactory, and that the tale may have been written after the suppression of the English monasteries.

In the Freiris of Berwik, every reader acquainted with the poems of Allan Ramsay must recognize the original of the Monk and the Miller's Wife; and we will venture to add that the ancient is greatly superior to the modern tale. Ramsay's tale, says Lord Woodhouselee, "would of itself be his passport to immortality, as a comic poet. In this capacity he might enter the lists with Chaucer and Boccaccio, with no great risk of discomfiture. Though far their inferior in acquired address, his native strength was perhaps not widely disproportionate. Of this admirable tale, I conceive he has the merit of the invention; as the story is not to be found in any of the older writers, as Sachetti, Boccaccio, or in the *Cento Novelle antiche.* In a few circumstances there is indeed a small resemblance to the 73d of the *Cent nouvelles Nouvelles,* entitled 'L'Oiseau en la Cage,' which barely affords a presumption that Ramsay may have read that story; but in all the material circumstances, his Monk and the Miller's Wife is original. A story of more festive humour could not have been devised. The characters are sustained with consummate propriety; the manners are true to nature; and poetic justice is most strictly observed in the winding up of the piece."[6] But whatever merit this comic tale may possess, it is evident that the praise of invention does not belong to Ramsay: he had doubtless read the old Scotish tale in Bannatyne's MS. from which he transcribed other poems less capable of arresting his attention. It may scarcely be worth while to remark that the ecclesiastic whom he introduces is a secular, a parish-priest, and is therefore most improperly described as a monk. That the author of the Freiris of Berwik was likewise indebted to some preceding poet, may perhaps be considered as highly probable. In the collection of Le Grand d'Aussy there is a *fabliau* which exhibits some lineaments of the story. A poor clerk, after having studied at Paris, is returning homeward without any money in his pocket, and, on the approach of night, calls at a solitary house to entreat a lodging; but the farmer's wife very unceremoniously refuses to shelter him during the absence of her husband. As he is leaving the house, he observes a servant bringing some wine in a basket; and at the same time the maid

[1] Opere di Dante Alighieri, tom. iv. p. 342. ed. Venezia, 1758, 4 tom. 4to.—Rodrigo de Valdes, a Jesuit, has written a long and extraordinary poem, containing a mixture of Latin and Spanish, and entitled "Poema heroyco Hispano-Latino panegyrico de la Fundacion y Grandezas de la muy noble y leal Ciudad de Lima." Madrid, 1687, 4to.

[2] This is an allusion to an ancient sequence, known to many English readers from the translations of Drummond and the earl of Roscommon. It begins in the following manner:

Dies iræ, dies illa
Solvet seclum in favilla,
Teste David cum Sybilla.

[3] The Poems of William Dunbar, with notes, and a memoir of his life, by David Laing: to which are added Poems by Walter Kennedy, and other contemporaries. Edinb. 1833, 2 vols. 8vo.—Of the poems of Dunbar this is the first collective edition that has yet been undertaken; and it is fortunate that the task was reserved for so industrious and so skilful an editor.

Dunblane.

places in a cupboard a cake which she has just made, together with a piece of fresh pork which she has taken out of the pot. A priest, wrapped in his cope, soon afterwards passes the clerk in silence, and glides into the house. The wayfaring scholar, overwhelmed with fatigue, and dying of hunger, seats himself by the road-side: there he is found by the farmer, who happens to return sooner than he is expected; and they procure admittance, after the priest has found a place of refuge in the stable, which seems to be the ground-floor under the family-dwelling. While the maid is preparing some refreshment, the *laboureur* proposes that the clerk should either sing a song or tell a story: he declares that he knows neither song nor story, but offers to relate an adventure which happened to him in the morning; and by detailing this supposed adventure, he very dexterously contrives to take his revenge on the farmer's wife. As he was traversing a wood, he saw a numerous herd of swine: some of them were large, others small, some white, others black; in a word, they were of all sizes and of all colours. But above all he admired the leader of this herd; he was fat, shining, plump—in a word, just such another as must have been that of which Catherine lately took a morsel from the pot. The clerk prosecutes his tale with the same arch simplicity, and contrives to reveal the secret of the wine, the cake, and finally of the priest concealed in the stable. The enraged farmer, having seized a cudgel, chastises his wife; and the priest, anticipating the same discipline, makes an attempt to escape, but is unmercifully beaten, stripped naked, and in this condition turned out of the house, leaving the clerk to enjoy his joke, together with the supper and wine provided for another guest.[1] This is certainly not the identical story of the Freiris of Berwik: several of the incidents are essentially the same, but the comic scene of the pretended conjuration is wanting. Still however the Scottish tale may have been borrowed from some preceding writer. A story not materially different occurs in a French collection published in 1665, and probably in many others: the scene is laid in Granada; the unfortunate gallant is an advocate, and the pretended magician a soldier.[2] This publication is indeed of a recent date; but such a tale is too pungent and characteristic to have been devised by the obscure compiler of the collection; and it is sufficiently probable that this tale and the Freiris of Berwik were both derived from one common source.[3] (D. I.)

DUNBLANE, a market-town of Scotland, Perthshire, pleasantly situated on the E. bank of the Allan, a tributary of the Forth, 4 miles N. of Stirling. In the middle ages it was the seat of a convent of Culdees, and continued to be so till about the twelfth century. It was constituted the seat of a bishop by David I., by whom the cathedral, founded in 1142, was richly endowed. Among its bishops was the celebrated Robert Leighton, who bequeathed his valuable library to the cathedral and diocese. This library still exists, and has been greatly augmented by subsequent donations. Dunblane is at present only a village, consisting of a single old-fashioned street, with various diverging lanes. A mineral well in the neighbourhood causes an influx of visitors during the summer months. The chief attraction of Dunblane is the cathedral, the choir of which is now the parish church. It is a large Gothic edifice, with a steeple of modern erection, 128 feet in height. The prebendal stalls of richly carved dark oak have fortunately been preserved. Market-day Thursday. About 2 miles from the town is Sheriff-muir, which gives name to the battle fought there on 13th November 1715, between the Earl of Mar and the royal forces under the Duke of Argyle. In this engagement the left wing of each army was defeated, and the right of each was victorious, but the fruits of the victory remained with the Duke of Argyle. At a short distance from Dunblane is the small village of Ardoch, in the immediate neighbourhood of which is the celebrated Roman camp, esteemed the most entire in the kingdom. The measure of the entire area of this camp is 1060 feet by 900, and it is calculated to have contained at least 20,000 men. The prætorium rises above the level of the camp, but is not exactly in the centre. It measures exactly twenty yards on each side. Pop. of Dunblane (1851) 1816.

Duncan.

DUNCAN, Adam, Lord Viscount, an illustrious naval commander, the second son of Alexander Duncan, of Lundie, in the county of Angus, Scotland, by Helen, daughter of Haldane of Gleneagles, in the county of Perth, was born in the month of July 1731. He received the rudiments of his education at Dundee, which is only about 4 miles distant from the family residence; and as his elder brother Alexander was designed for the army (in which he died lieutenant-colonel in 1771), Adam appears to have been early intended for the naval service. Accordingly, about the year 1746, he was placed under Captain Haldane, who then commanded the Shoreham frigate, and he remained two or three years with that officer. In 1749 he was entered as midshipman on board the Centurion of fifty guns, which then bore the broad pendant of Commodore Keppel, commander-in-chief on the Mediterranean station. In the beginning of 1755 he was promoted to the rank of lieutenant, and appointed to the Norwich, a fourth rate, one of the squadron under Keppel, destined to convoy to America the transports having on board the land forces commanded by General Braddock. After the debarkation of this armament he was transferred to the Centurion, where he continued until that ship returned to England; when Captain Keppel, who had for a short time commanded the Swiftsure, procured his appointment as second lieutenant of the Torbay seventy-four, to which he himself had just been appointed. Having remained on the home station for three years, he proceeded with the expedition sent against the French settlement of Goree, on the coast of Africa, and was slightly wounded in the attack of the fort; after which he became first lieutenant of the Torbay, and in this capacity returned to England. His promotion was now rapid. In September 1759 he was raised to the rank of commander; in February 1761 he was advanced to that of post-captain; and having been appointed to the Vaillant, of seventy-four guns, he again became connected in service with his original friend and patron Keppel, who, having received the command of the naval part of the expedition against Belleisle, now hoisted his broad pendant on board the Vaillant. After this affair Captain Duncan accompanied the commodore in the same ship to the attack of the Havanna, and commanded the boats in which the troops were landed, the commodore covering the disembarkation. He was afterwards very actively employed in the siege, during which he greatly distinguished himself; and when the town surrendered, he was despatched to take possession of the Spanish ships in the harbour, namely, five of seventy and four of sixty guns.

[2] Les Recreations Françoises; ou nouveau Recueil de Contes à rire; pour servir de divertissement aux melancholiques, et de joyeux entretien dans les cours, les cercles, et les ruelles, part. i., p. 178. A Rouen, chés David Berthelin, dans la Cour du Palais, 1665, 2 part. 8vo. The compiler, whose name is Nipe, professes to have gleaned from all the ancient and modern books of tales, and to have added new stories of his own invention, "plus capables de faire mourir de rire, que de faire dormir de bout."

[3] A similar incident occurs in Ravenscroft's London Cuckolds, a Comedy, act ii., sc. ii., Lond. 1683, 4to. In reference to this scene, Langbaine has remarked that "Loveday's discovering Eugenia's intrigue, and pretending to conjure for a supper, is borrowed from *Les Contes d'Ouville*, part ii. p. 235." (Account of the English Dramatick Poets, p. 421. Lond. 1691, 8vo.)

After the capture of the Havanna, he, in the same capacity as formerly, accompanied Admiral Keppel, who had been appointed to the command on the Jamaica station, and continued with him as captain of the flag-ship until the conclusion of the war, when he returned to England.

On the recommencement of war with France in the year 1778, Captain Duncan was appointed to the Suffolk, of seventy-four guns; but before the end of the year he was removed into the Monarch, of the same rate, which, during the summer of 1779, was employed in the Channel fleet under Sir Charles Hardy, who, owing to the junction of the French and Spanish fleets, was now acting upon the defensive. Towards the close of the same year, the Monarch was one of the ships placed under the orders of Sir George Bridges Rodney, who had received instructions to force his way through all impediments into Gibraltar, and to relieve that fortress, then closely invested by a Spanish army on the land side, whilst it was blockaded on the seaward face by a flotilla sufficiently powerful to oppose the entrance of any ordinary force. In the beginning of 1780, the British fleet, when off Cape St Vincent, fell in with a Spanish squadron under Don Juan de Langara, which had been stationed there to intercept Sir George Rodney, who was supposed to have only a squadron of four sail of the line. On this occasion Captain Duncan carried the Monarch into action before any other ship of the fleet; and the St Augustin, of seventy guns, struck to him, after having been so much disabled that he was obliged to abandon her. In this action the disparity of force was great; the British fleet consisting of nineteen ships of the line, and the Spanish of only eleven ships and two frigates. Of the latter, four were taken, one was blown up, three surrendered, but afterwards got away much damaged, one was reduced almost to a wreck, and two others, together with the frigates, made their escape. Soon after his arrival in England Captain Duncan quitted the Monarch, and remained without employment until the beginning of 1780, when he was appointed to the Blenheim, of ninety guns, and continued in command of this ship during nearly the whole remainder of the war. He was constantly employed with the Channel fleet, then under the command of Earl Howe; and in September 1780, having accompanied his lordship to Gibraltar, he was appointed to lead the larboard division of the centre, or squadron of the commander-in-chief, and greatly distinguished himself in the encounter with the combined fleets of France and Spain, which took place off the entrance of the Straits. Soon after the return of the fleet to England Captain Duncan was removed into the Foudroyant, of eighty-four guns; and on the conclusion of the peace in the spring ensuing he passed into the Edgar, of seventy-four guns, one of the guard ships at Portsmouth, where, as is customary in such cases, he continued in command during the three succeeding years

This was the last commission which he ever held as captain of a ship. In September 1789 he was promoted to the rank of rear-admiral of the blue, and in September 1790 he was made rear-admiral of the white; in February 1793 he was raised to be vice-admiral of the blue, and in April 1794 he became vice-admiral of the white; in June 1795 he was appointed admiral of the blue; and lastly, in February 1799 he received the rank of admiral of the white. But during all these periods, excepting the two last, the merit of Admiral Duncan, which was never of an obtrusive, bustling, or forward kind, seemed to have been wholly overlooked; and though he frequently solicited employment, his applications proved unavailing; in consequence of which he had it in contemplation to retire altogether from the service. This period of obscuration, however, at length passed away. In February 1795 he received an appointment, constituting him commander-in-chief of the North Seas, that is, from the North Foreland to the Ultima Thule; and he accordingly hoisted his flag on board the Prince George, of ninety-eight guns, at Chatham, but afterwards shifted it to the Venerable, of seventy-four guns, the Prince George being considered as too large for the particular quarter in which he was destined to act. Having thus attained the object of his wishes, Admiral Duncan lost no time in proceeding to carry into execution the important trust which had been confided to him; and during the whole time he held the command, he exhibited that inexhaustible patience and unwearied constancy, which, with cool judgment and determined gallantry, formed the great attributes of his professional character. In the midst of many discouragements, and on a station exposed to peculiar dangers from the shoals and sand-banks which cover the coasts of the United Provinces, and the storms with which the North Sea is frequently visited, he never shrunk from the duty which had been assigned him, or failed at any season, however tempestuous, to show his squadron off the coast which it domineered over and insulted.

For more than two years, however, nothing occurred beyond the ordinary routine of such a service; namely, occasional captures, and smart affairs with the coast batteries and the craft which took shelter under their guns. The Dutch trade, however, was nearly annihilated; their merchant-vessels were frequently captured in sight of their own ports; and the whole coast was so completely blockaded that few vessels could venture out to sea, and escape the vigilance of the British fleet or its cruisers. The Batavian fleet, though consisting of five sail of the line, six frigates, and five sloops, was also obliged to remain quietly in port, or to confine itself to short cruises, at times when want of water or provisions compelled the British ships to repair for a few days to their own coasts; and in the beginning of June 1797, it even suffered itself to be blocked up in port, although for several days Admiral Duncan's force was limited to his own ship the Venerable, of seventy-four guns, and the Adamant, of fifty. This was owing to the unhappy and dangerous spirit of mutiny which at that period had infected in succession almost every portion of the British navy. It first broke out amongst the ships at Portsmouth, then extended itself to the fleet at the Nore, and afterwards reached the North-Sea fleet, in which almost every ship hoisted the flag of defiance. At this alarming and unprecedented crisis, the conduct of Admiral Duncan proved him to be equal to the fearful exigencies of the occasion, and perhaps contributed more to the safety and true glory of the country than even his subsequent victory. Although by the secession of the disaffected ships his fleet had been so thinned that, towards the end of May 1797, he found himself at sea with only his own ship and another, he nevertheless proceeded to his usual station off the Texel,[1] where

[1] On the 3d of June 1797, Admiral Duncan having assembled the officers, seamen, and marines of his own ship (the Venerable), addressed them from the quarter-deck as follows:—"My lads, I once more call you together with a sorrowful heart, from what I have lately seen of the disaffection of the fleets; I call it *disaffection*, for the crews have no *grievances*. To be deserted by my fleet in the face of an enemy, is a disgrace which I believe never before happened to a British admiral; nor could I have supposed it. My greatest comfort, under God, is, that I have been supported by the officers, seamen, and marines of this ship; for which, with a heart overflowing with gratitude, I request you to accept my sincere thanks. I flatter myself, much good may result from your example, by bringing those deluded people to a sense of the duty which they owe, not only to their king and country, but to themselves. The
